The fourth pillar of Islam is fasting (sawtn), which occurs each lunar year during the month of Ramadan. All adult Muslims who are in good health are expected to fast, and despite the fact that many persons privately may choose not to do so, public fasting is observed almost everywhere. During Ramadan, Islam is more consciously brought into daily activities; religious lessons are given nightly on the radio and television and in mosques. It is the month of repentance and purification. Some Muslims, defensive against the West, rationalize the fast by praising its supposed medical virtues in cleansing the vital organs of the body. Yet, as indicated in Chapter 8, its more important meaning is the ability of Muslims to follow the code of conduct fixed by Islam and thus to demonstrate their self-discipline and control over self. The fast carries a variety of more elaborate interpretations, as the Fallerses indicate in their account of the fast in Turkey and Antoun in his account for rural Jordan, but the public manifestation of the community's ability to observe the fast is a key and universal aspect of belief and practice.[9] Eating, drinking, smoking, and sexual intercourse are prohibited between dawn and sunset and, more significantly, Muslims are expected to engage in spiritual self-renewal. At night, in contrast, sociability is in many ways increased; visiting among friends and relatives is intensified, and the practical meaning of what it is to be a Muslim is enhanced for the entire community.

[9] L. A. Fallers, assisted by M. C. Fallers, "Notes on an Advent Ramadan," Journal of the American Academy of Religion, 42, no. 1 (March 1974), 35-52; Richard T. Antoun, "The Social Significance of Ramadan in an Arab Village," Muslim World 58 (1968), 36-42, 95-104.

The fifth pillar is the pilgrimage (hajj) to Mecca, obligatory once in a lifetime for every Muslim economically and physically able to do so. Even more than the month of fasting, the pilgrimage is an obligation that removes pilgrims from the constraints of

ordinary, particular obligations. From the moment pilgrims set out on the journey, they are removed from Ordinary society and become “liminal” in the sense of the term made popular by Victor Turner.[315] Pilgrims agree to dedicate their lives to Islam and must be in a state of ritual consecration to make a valid pilgrimage. Pilgrims may not uproot plants or shed blood —if they do so, they must atone for it by ritual means. Sexual intercourse is also forbidden. As a sign of their consecration, if they die while on pilgrimage, they are thought to enter paradise immediately.

During the pilgrimage, ordinary social relationships with kinsmen, neighbors, and others assume a diminished importance. One’s identity as a Muslim and brotherhood in Islam are of paramount significance. Every step of the way becomes highly symbolic of the pilgrim’s wider identification with Islam; the web of particularistic social relationships is supposed to be transcended. Ritually speaking, the Ka^cba is regarded as the symbolic center of the world, however peripheral it might be in terms of the ordinary social and political systems in which pilgrims are otherwise enmeshed.

In recent years, more than a million pilgrims annually have made the voyage. Its timing changes each year, for as with other key Islamic rituals, the time of the

FIGURE 9-2 Pilgrims often visit the shrines of local marabouts before departing for Mecca. Tunisia, 1973. (Courtesy Nicholas S. Hopkins.)

pilgrimage is set by the lunar calendar. Pilgrims from nearby countries arrive by bus and even by foot; those from more distant locales arrive by air, with only small numbers now arriving by sea.

In the past, as with equivalent rituals in Europe, the pilgrimage was a long and arduous journey from which many persons never returned. Every step of the way was fraught with danger, but this only enhanced its spiritual richness. A voyage of a year or longer was not uncommon for pilgrims coming from North Africa, so that before they left on the hajj, they set their affairs in order in case they should never return. Even in the mid-nineteenth century, when modern sea transport and relative peace and security made the pilgrimage easier, it still had its uncertainties.[316] For many, it was a voyage of'intellectual, and even commercial, discovery. Religious scholars at Mecca and along the way had contact with the major intellectual currents elsewhere. Merchants could use the pilgrimage as an occasion to establish bonds which were of use in the conduct of international trade.[317]

FIGURE 9-3 Principal traditional caravan routes to Mecca. (Aramco World Magazine, November-December 1974.)

There are many descriptions of both the transformation that the pilgrimage effects upon Muslims and its ritual significance. In most parts of the Muslim world it is a pious act for pilgrims to write an account of their journey for the guidance of others, although it is the unusual pilgrims whose accounts perhaps best reveal the intense meaning that the pilgrimage carries for the community of the faithful.

Malcolm X was one such unusual pilgrim. Given the bitterness of his own racial perceptions in America, his remarks are especially poignant. He remarked on the fact that the tens of thousands of pilgrims “were of all colours, from blue-eyed blondes to black-skinned Africans. But we were all participating in the same ritual, displaying a spirit of unity and brotherhood that my experiences in America had led me to believe could never exist.”[318] He went on to say that he observed color patterns in the crowds in the sense that like stayed with like but concluded that “true brotherhood” existed when these patterns existed with no complexes of superiority or inferiority.

For others, the pilgrimage assumed a mystical significance. Even Richard Burton, never a pilgrim to be moved by ordinary emotions, could not refrain from expressing his exaltation upon first arriving, disguised, in Mecca:

There at last it lay, the bourn of my long and weary Pilgrimage, realising the plans and hopes of many and many a year. The mirage medium of Fancy invested the huge catafalque and its gloomy pall with peculiar charms ... the view was strange, unique—and how few have looked upon the celebrated shrine! I may truly say that, of all the worshippers who clung weeping to the curtain, or who pressed their beating hearts to the stone, none felt for the moment a deeper emotion than did [I].

Resuming his characteristic orientalist distance, Burton continued:

It was as if the poetical legends of the Arab spoke truth, and that the waving wings of angels, not the sweet breeze of morning, were agitating and swelling the black covering of the shrine. But, to confess humbling truth, theirs was the high feeling of religious enthusiasm, mine was the ecstasy of gratified pride.[319]

There are nine ritual steps to the pilgrimage itself. Here my intent is not to present a structuralist explanation of the significance of these events but merely to suggest some aspects of their symbolic richness.[320] (1) First is the donning of the

FIGURE 9-4 Principal steps of the hajj. (Based upon an illustration in Aramco World Magazine, November-December 1974.)

ihram, a white seamless garment that for many Muslims symbolizes the pilgrims' search for purity and their separation from the ordinary world. This may be donned anywhere along the route but at the latest at fixed points signifying the confines of Mecca. No jewelry or other personal adornment may be worn, nor are pilgrims supposed to engage in disputes. Providing that the pilgrims have declared their intention (mya) of making the pilgrimage, they are ready to enter the haram, the sacred enclosure of Mecca itself, thought to have been established by Abraham and confirmed by Muhammad. Non-Muslims are not allowed within its confines. Then (2) on the eighth day of the lunar month of Dhu 1-Hijja, the month of the pilgrimage, pilgrims proceed to Mina, a small uninhabited village five miles east of Mecca. There they spend the night meditating and praying.

The next morning, the pilgrims move as a group to the plain of ^c Arafa for the central rite of the pilgrimage, the (3) "standing" before Mount ^c Arafa, the Mount of Mercy. They face Mecca, meditate, and pray. Many spend the entire time standing, from noon to sunset. Some climb almost to the summit of the two-hundred- foot mountain, at the foot of which the Prophet was supposed to have delivered his last sermon.

Just before sunset, a cannon sounds and the pilgrims proceed to (4) Muzdalifa, a few miles back toward Mina. There they worship and sleep under the stars after gathering a number of pebbles for use on the following day. The next morning, before daybreak, they return to Mina, where they throw the pebbles at three white-washed masonry pillars, especially the one thought to represent Satan, who three j times tried to persuade Abraham not to obey God's command to sacrifice his son. j The throwing of the pebbles symbolizes the repudiation of evil.

(5) For the Feast of the Sacrifice (^cId al-Kabir) all pilgrims who can afford to do so buy a sheep or other animal for sacrifice and give away part of it to the poor , although given the quantity of meat sacrificed, most of it is not consumed. This sacrifice has a range of meanings. It commemorates Abraham's willingness to sacrifice his son; it symbolizes the readiness to give up what is dearest to the pilgrim if commanded by God; it offers thanksgiving to God for having communicated with humans and reminds pilgrims to share their blessings with the less fortunate. Muslims throughout the world vicariously share in the elation of the pilgrims by performing their own sacrifices on the same day.

Once pilgrims have offered their sacrifices, they have completed a major part of the pilgrimage. Men shave their heads and women cut off a lock of their hair to symbolize their

deconsecration. Pilgrims now are free to bathe and to remove the ihram, although the prohibition on sexual intercourse remains.

The pilgrims next proceed directly to Mecca and perform (6) the tawaf, the circling. They circumambulate the Ka^cba seven times on foot, reciting a prayer on each circuit. This circling is said by some to symbolize the unity of God and man and of heaven with earth and reminds believers of the importance attached to the Ka^cba by the Patriarch Abraham, his son Ishmael, and Muhammad. During the j circling, many pilgrims try to touch the black stone which is embedded in one J comer of the Ka^cba.

‘FIGURE 9-5 Colonnades of the great mosque, Mecca, (Aramco World Magazine, November-December 1974.)

The key ceremonies of the pilgrimage are now completed, and pilgrims have the right to call themselves hajj-s. Most pilgrims, however, proceed to the “Place of Abraham,” where Abraham is supposed to have offered his devotions to God. There pilgrims reenact (7) the “running” (sa^cy), the search for water by Hagar, the wife of Abraham (and Sarah’s rival in the Bible). Hagar ran back and forth desperately searching for water for herself and her child until the angel Gabriel appeared, stamped the ground with his heel, and brought forth water from the well of Zamzam for them. Pilgrims drink from this well before starting the running; many return home with bottles of water from the well.

Pilgrims then customarily return for a third and last time (8) to Mina, where they cast their remaining pebbles at each of the three pillars—seven stones at each pillar for each day of the pilgrimage. This also is a time to visit with other pilgrims and to bid farewell to friends. Their final visit is to Mecca again, where pilgrims again circumambulate the Ka^cba (9) before returning home.

There is a rich tradition of myths associated with each of the steps of the pilgrimage, and these myths have been variously interpreted throughout the Islamic world. The rituals associated with the pilgrimage are interpreted in slightly different ways for Sunni and ShI^cI Muslims, at least on a popular level.

*** The Sh^cra

Unlike the case for Christianity, there is no' formal clergy in the Muslim world and no center of priests who can decide upon what is and is not orthodox. Hence it is misleading to speak of schisms in the Muslim community. There is ho formal religious center from which judgments of orthodoxy and heterodoxy can be made. Even with this consideration in mind,

Shl^ca are set apart from Sunni Muslims in terms both of how they interpret and elaborate the meaning of Islam and in the practical sense of self-differentiation from other Muslims. Nonetheless, the ShFa, like other Muslims, firmly believe in the universality of Islam and the integrity of the Muslim community.

The word Shi^ca itself means “party” or “sect.” This label in part reflects the origin of Shl^cism as a political movement in seventh-century Arabia. ^cA1I, the son- in-law of the Prophet Muhammad, was the fourth of his caliphs (khaHfa-s), or successors (656-661).[15 C] A1I was later assassinated by his opponents, as was Husayn (in 680), the grandson of the Prophet. Both men are considered by Slu^ca to be martyrs. After ^cAll’s assassination, the “party” of ^cAli in Kufa, in southern Iraq, demanded that succession be restored to ^cAll’s descendants alone. This legitimist claim continues to be a core belief of the Shl^ca. One contributing factor to Shl^cism

[16] See Marshall G. S. Hodgson, “How Did the Early Slu^a Become Sectarian?,” Journal of the American Oriental Society, 75, no. 1 (January-March 1955), 1-13, for a subtle account of how what are now accepted as the “basic principles” of Sht^ctthought and practice emerged. His Venture of Islam is also an indispensable reference.

at least in its formative years was the tension between newly conquered non-Arabs and their Arab rulers. From the very beginning Shiism has been a movement of political opposition and of social discontent and has carried with it the notion that the Shl^ca are persecuted, although in recent years this component of ShI^cI doctrine has had less importance than in the past.

Most Islamic historians have stressed the doctrinal differences between Sunni and Shf^ca, an approach which is misleading from an anthropological and social historical perspective because Sunni Islam is no more a homogeneous entity than is Shi[0] ! Islam. A more promising approach to characterization of the distinctive features of Shi[0] ! Islam is taken in a seminal paper by Leonard Binder.[321] His approach concentrates upon the relation between the practical organization of Shl'T men of learning (called collectively ^culama’ as they are among Sunni Muslims) and certain aspects of ShI^cT doctrine that are both theologically propagated and popularly accepted. His overall points are that (1) for doctrinal reasons ShI^cT men of learning are accorded greater religious authority than their Sunni counterparts; (2) for historical reasons, ShI^cI men of learning have not been as seriously challenged in their authority as has been the case with Sunni religious scholars; (3) the ShI^cT religious “establishment” is more hierarchically organized and centralized; and (4) ShI^cI men of learning have been more effective in maintaining their autonomy from government control and in maintaining a strong popular base for their legitimacy, as the 1978-1979 revolution in Iran vividly demonstrates.[322]

In doctrinal terms, the Shl^ca hold that the only legitimate successors of Muhammad were his descendants through his son-in-law ^cA1I and his daughter Fatima. Most Shl^ca believe that there were twelve legitimate Imams, or leaders of the Islamic community, including ^cA1I. The twelfth Imam is said to have hidden himself from this world, to return at some later time. Since then, the Imams have been hidden, so that it is the responsibility of recognized men of learning to interpret Islamic doctrine and to guide the Muslim community as new situations arise. The Imams are thought to have the charismatic qualities of the Prophet, except the gift of prophecy itself. Leading men of learning partake to a certain extent of the charismatic qualities attributed to the Imams, a feature almost entirely lacking in at least the formal doctrines of Sunni Muslims. I stress formal, for at a popular level, neglected until recently by many Islamic historians, other beliefs such as that a mahda, or “rightly guided one,” will return the community of Muslims to its proper course, are often present. The takeover of the Great Mosque at Mecca in November 1979 by a band of armed militants who proclaimed that one of their number was the “hidden” Imam indicates the continuing political potential of such a belief.

Most Shl^ca stress the practice of taqiya, or “concealment.” In the face of persecution, Shi^ca are said to be able to dissimulate their real beliefs if the expression of them would result in grave physical danger or threat to the community. Thus ^cAH, whose caliphate was contested throughout his lifetime, is alleged to have “concealed” his firm belief in the right of his descendants to be Muhammad’s successors because of such a threat. One practical consequence of this doctrine has been to allow Shf^cism in practice to accommodate a range of complementary beliefs of other religious traditions in the region: Christianity, Manichaeism, and other doctrines.[323] In fact, the practical ties of groups such as the Shabak of northern Iraq to the wider ShI^cI community are virtually nonexistent; they have their own leadership and their need to develop formal doctrine is not as paramount as it is in the case of the predominant “twelver” Shl^ca of Iran and elsewhere in Iraq.[324] At a greater extreme, the rituals and formal beliefs of the Alevi (Ar. ^Alavn.) Muslims of Turkey, Iran, and Syria (where the current president is an ^cAlawi) are such that many of their Sunni and ShI^cI neighbors do not even accept them as Muslims.[325] Numerous Shi^cI groups exist elsewhere that accept a different number of Imams and in other ways maintain a separate leadership and sense of practical community.

Binder’s second point is that at least in Iran, ShI^cI men of learning had no living Imam to reduce their status. Ayatullah Khomeini’s popular support is indicative of the potential strength of such leaders. Elsewhere in the ShI^cT world, as with the Zaidis in Yemen, the IsmaPilis and the Fatimite caliphate of medieval Egypt, there were living Imams. During certain periods in Iran’s history, the role of Shl^ci men of learning was strengthened by the

government. Because of the lack of formal colonial domination in Iran, the presence of ShI^cT shrines and centers of learning in neighboring Iraq, notably Karbala and Najaf, which serve as places of refuge in times of political crisis, the lack of major religious opposition (such as could be provided by an effective modernist movement), and the lack until quite recently of a large body of intellectuals with Western-style educations has meant that Shi^cI men of learning have had no substantial challenge to their legitimacy other than that of the pre-1978 ruling circles.

Binder's third consideration, the institutional organization of Iran's ^culama', fits nicely with Bill's stress upon the significance of patterns of informal association (see Chapter 8). Strictly speaking, there are no formal patterns of institutional leadership among the ShT^ca of Iran, but the pervasive informal ones enable ShI^cI men of learning to mobilize their followers effectively. Perhaps because the patterns of leadership are informal, they are more difficult for hostile governments to control and suppress. There are mullahs, or village preachers, associated with each mosque and a number of other lesser religious figures. At the higher level are scholars called mujtahids, those who by study and personal piety are capable of making independent judgments and interpreting Islamic tradition. In contemporary Iran, mujtahids acquire recognition by publishing books outlining their methods and views for public comment. At a level above mujtahids are scholars called Ayatullahs, a term which literally means a "sign of God." At the very apex of the hierarchy is a scholar called the "supreme" Ayatullah, Ayatullah al-^cUzma, considered to be the most learned scholar of his age and whose piety is beyond question.[326] There is no formal "election" of such individuals. At all levels of the hierarchy, success depends in part upon the ability to attract a popular following and to obtain financial support from followers which can be used to support the education of religious students, the upkeep of ShI^cT shrines, and other religious activities. At higher levels, success depends additionally upon recognition by other men of learning. Binder suggests that recognition as Ayatullah al-[z] Uzma is in practice in the hands of a relatively small group of thirty or forty religious scholars residing at Qum, one of the holy cities of Iran. Many of these leaders are themselves descendants of famous religious scholars of the past, but the succession to leadership still depends largely upon a reputation for religious learning.[327]

Finally, Iran's ShT^cT religious leadership has managed to retain popular support despite the significant political and economic transformations undergone by at least part of Iran's population.[328] With the exception of the supporters of Iran's former regime, some Westernized intellectuals, and a few Muslims influenced by various reformist movements, traditional Shi^cI men of learning have managed to retain the support of the peasantry and most of the merchants and craftsmen participating in Iran's bazaar economy. Despite divergences among ShI^cT leaders, for the most part they have managed to retain the loyalty of "traditional" groups, and to win the support even of a number of students in the "modern" educational sector, as well as the support of what Binder calls somewhat ironically in terms of the 1978-1979 revolution the "uninfluential classes" of Iranian society.[329]

Especially at the popular level Shl^cism has certain key rituals that dramatically indicate the central elements of belief and practice. One of these is the annual mourning (tafziya) in commemoration of the death of Husayn, the Prophet's grandson, at Karbala, Iraq, in the lunar month of Muharram in a.d. 680. For the Shi^ca, Husayn is the third Imam. Muhammad and ^cA1I were the fest two. As the late Gustave von Grunebaum wrote: "It would be incorrect to say that Husain stands in the center of SH^ca dogma, but it is unquestionably true that contemplation of his personality and fate is the emotional mainspring of the believer's religious experience."[330] Shl^ca consider it to be particularly beneficial to be buried next to Husayn's grave in Karbala. For centuries caravans brought the dead to be interred there, and in more recent times an airline specialized in flying remains there has been established.

In the Shl^ci tradition Husayn's death is interpreted as a voluntary sacrifice so that through his suffering, Shl^ci faithful could enter paradise. The popular commemoration of Husayn's martyrdom has been described by Elizabeth Fernea, who was in Karbala in 1957, together with women from a nearby village where she was living.[331] At that time Karbala was a town of thirty thousand people, but with the pilgrims arriving during Muharram its population swelled to over a million, with black tents erected for the pilgrims. Similar ceremonies, although not of course attracting an equivalent influx of pilgrims, occur in various forms in ShI^cT communities in the entire region. From the first of the month, when the commemoration begins, mourning clothes are donned; people refrain from bathing and shaving and adopt a simple diet. Pulpits are placed in the street from which the story of Husayn's martyrdom is recited, often with many added details. Listeners commonly break out in tears. Also during this period, at least through the 1950s, groups of men seeking penance, with their half-naked bodies dyed black or red, toured the streets, pulling out' their hair, inflicting sword wounds upon themselves and dragging chains behind them. Not infrequently, fights with non-ShI^ca developed as well as fights between rival neighborhood factions. I use the past tense to describe these activities because both the Iranian and Iraqi governments have at least formally banned the more extreme of these activities, although many continue to be carried out in modified form, especially in more remote areas.

On the 10th of Muharram, a large procession designed as a funerary parade reenacts the last episodes of Husayn's life and his burial. A coffin, a few arms, and Husayn's banner are the only props necessary for the reenactment of the last days of his life.

A number of versions of these mourning plays exist, often keyed to local social and political circumstances.[332] The ta^czTya for Husayn consists of some forty

FIGURE 9-6 Carrying Husayn's corpse,
ta^cziya drama, southern Iraq, 1955. (From Sigrid Westphal-Hellbusch and Heinz Westphal, "Die Ma'dan; Kultur und Geschichte der Wlarschen-bewohner im Siid-lraq," Forschungen zur Ethnologie und Sozialpsychologie, Band 4 [Berlin: Duncker & Humblot, 1962], plate 60. Courtesy of the authors and the publisher.)

to fifty loosely connected episodes. Since the audience knows the play in advance, j the drama does not rely upon suspense but upon how the particular scenes are constructed. Anachronisms abound in many presentations; in some versions, European Christian ambassadors are made to betray Husayn rather than Sunni Muslims. Old Testament figures similarly are introduced. The performance is often highly realistic, so realistic in the nineteenth century that condemned criminals often were made to play the part of the slayers of Husayn in case the spectators i became so enraged that they attacked the actors themselves. The final scene involves a procession with the martyr’s coffin (or in some versions a severed head) to the court of the Sunni caliph. On the way, Christians, Jews, and Sunni Muslims j are portrayed as bowing before Husayn.

The symbolism of these commemorative plays for Shi^ca carries the clear i

message that the sacrificial death of Husayn is linked to their salvation. In one j version of the play, in fact, the angel Gabriel is made to announce to Muhammad that his grandchild will die, not because he is guilty of any wrongdoing, but so that his blood will be redeemed. [333]

The intensity of such public performances, coupled with the lack until recently of anthropological accounts of popular understandings of ShT^cism, have led to a misunderstanding of many aspects of Sh!^cI belief. For instance, the pilgrimage to Mecca is as important to Shi^ca as it is to other Muslims, but it is differently interpreted. Most pious ShT^ca consider the pilgrimage to Mecca significant at least in part because nearby Medina is the place of burial of the Prophet Muhammad, one of their recognized Imam-s. Pious Shi^ca also try to visit the shrines of the other Imams, located throughout Iran and Iraq, so that structurally the pilgrimage is not of the same importance for them as it is for many Sunni.

Because the ShT^ca tend to be located in regions where their orientation toward Islam is only one of many, and because the tendency of many Western writers has been to consider Sunni Islam as “orthodox,” distorted views of popular ShT^cism still prevail. A personal experience might indicate this attitude. In 1968 I spent a month in Iran. Shortly after my arrival, a Sunni colleague from a neighboring country warned me that I would most likely encounter ShI^cI hostility,

especially in the smaller centers. For example, I was cautioned that the ShT^ca would undoubtedly break any glasses or plates after I had used them. I do not speak Farsi, but at the time spoke a reasonably fluent Iraqi Arabic, a dialect known to many Iranians, especially religious scholars. I encountered no hostility and in fact left Tehran for Baghdad by a bus on which most of my fellow travelers were Shi[0] ! pilgrims on their way to visit the shrines in Iraq. The bus stopped regularly for collective prayers, the pilgrims sang together and shared their food with me. Later I mentioned to a mujtahid what I had been told about the breaking of dishes and glasses. He laughed and replied that such objects were too expensive to break each time a nonbeliever was offered hospitality. My direct contact with the Sh!^ca was brief but sufficient to suggest that in the case of the region of Iran and Iraq, as with the complex religious situation described by Canfield for Afghanistan, each religious group holds strong and often unfavorable sentiments regarding the presumed comportment of the others.[334]

*** An Ideological Frontier?: The Alevi

The ambiguous situation of the Alevi in eastern Turkey, Syria, and northern Iraq dramatically underscores the difficulty, at least from a sociological perspective, of defining Islam too strictly in terms of a supposed orthodoxy. The Alevis of eastern

Turkey have been the subject of study by Nur Yalman, a Turkish anthropologist]

who together with other Turkish intellectuals has evinced a renewed interest in the strength of religious traditions in Turkey.[335] From the 1920s until very recently, Turkey’s militantly secular leadership has sought in various ways to discourage religious observances. Yalman avers that “Social Darwinism” became the dominant ideology of the Turkish upper classes and a justification for “embracing” Western | culture.[336]

This attitude on the part of the elite met with significant popular resistance as many Western-educated Turks have begun to acknowledge in recent years. Some religious orders such as the BektasKya have had decisive political influence since at least the eighteenth century and were regarded warily by Ottoman officials and later by those of the Turkish state ,[337] Many religious orders (tariqa-i) appear to have been driven underground but still enjoy considerable popularity. The rediscovery by Turkey’s educated elite of the strength of religious organization and belief also points to the necessity for anthropologists to consider the articulation of divergent religious ideologies or attitudes toward religion within complex national traditions. ;

The region of Alevi settlement in eastern Turkey is part of a continuum of the shatter-zone of religious groupings described by Rassam for northern Iraq.[338] There are small Christian communities, including Armenians and Assyrians. Most of the population is Muslim, but they

are divided between the Sunni, which Yalman glosses as “orthodox,” and Alevi, Bektashi, and Nuseyri. To some extent these divisions coincide with linguistic ones: the Nuseyri speak Arabic, the Bektashi speak Turkish, and the Alevi speak both Turkish and Kurdish. The Sunni com- j munities are cross-cut by following various of the major legal schools in Islam and various brotherhoods. There is even a community of the Yazidis, popularly known as “devil worshippers,” in the region.[339]

Many Shl^ca (and Sunni) reject the Alevis as non-Muslims. Nonetheless, as the name Alevi implies, their beliefs and practices have much to do with the role of j ^cA1I in Islam. Yalman’s description mostly concerns a small, bleak peasant village of some sixty-seven houses. As Yalman points out, the first thing a stranger notices < about the village is the lack of any building showing a minaret: “There was no call to prayer and no mosque.”[340] Additionally, men tended to have mustaches which covered their upper Up in part to symbolize the secrecy of their creed as opposed to the more clipped mustaches of the other sectarian groups.

Alevi ritual practices contrasted markedly with those of the Sunni of the region. A brief contrast of ritual and belief in terms of the five pillars of Islam indicates the singular nature of their beliefs from a Sunni perspective. In terms of the declaration of faith, Alevis emphasize the role of ^cAE in addition to the oneness of God and the prophecy of Muhammad. Sunm Muslims of the prevalent Hanafi rite of the region pray five times daily, with a total of about forty bowings (rak^a-s) daily (according to Yalman there are about eight bowings in each of the five prayers). For the Alevis, two bowings annually in the presence of their prayer leader are sufficient. Sunnl-s fast the entire month of Ramadan; Alevi Musims consider this a fetish. They fast only twelve days of the year in memory of the twelve Imam-s. As for the pilgrimage to Mecca, they consider this to be “external pretense.” The real pilgrimage is internal and in one’s heart.[341] For the Sunni, or (to use Hodgson’s phrase) the shari^c<z-minded Muslims, such interpretations of the Islamic tradition are unacceptable. Yalman delineates other points of contention: Alevis are reputed not to perform ablutions correctly after sexual intercourse, and their secretive religious organization is regarded with suspicion by their non-Alevi neighbors. All but the most major disputes are resolved in the community itself and are not brought before the formal apparatus of the government. Within the Alevi community the rituals associated with the Feast of Abraham (Ar. ^cId al-Kabir) are known as Ayin-i Cem. Outside the community it is known as mum sondu (“candle blown out”), a term “associated with the myth of communal sexual intercourse and incest.”[342]

This ritual occurs once or twice yearly, when the Dede, or spiritual leader of the community, visits it from where he lives in a neighboring town. A key element of the ritual involves members of the community approaching the Dede in pairs, hand in hand, kneeling down and walking on all fours, like lambs, to kiss the hem of his coat. They then perform the only obligatory Alevi prayer. This is also the time at which the Dede attempts to settle outstanding disputes in the community, and the community sacrifices a ram.

Yalman’s article is primarily diagnostic in that it documents Alevi social organization and popular belief and the relations between Alevis and non-Alevis (it might be added that the village described by Yalman had a heavy incidence of labor emigration). He also acknowledges the breakdown of communications between villagers and the Turkish government, especially the ministry responsible for religious affairs, the resilience of religious faith despite all efforts by the earlier republican government to discourage religious practices, and the increasingly evident political significance of these popular attitudes toward religion.[343]

*** Sufism

I suggested earlier that “universal” religions such as Islam are prismatic in their richness and involve multiple levels of belief and experience. The pervasive notion of community, the “Five Pillars” of Islam, the respect and authority accorded men of learning, and the practical organization of the community of believers (as opposed to normative adherence to the universal community of Islam) vary considerably. This section elaborates the notion introduced earlier of the copresence of alternative, or complementary (depending upon circumstances), notions of Islam. One dimension of Islam is the universalistic one of formal belief and practice, designated by the late Marshall Hodgson as a shun^ca-minded Islam concerned principally with outward, public credos and behavior (such as normative adherence to the five pillars) and the elaborate body of Islamic scholarship and jurisprudence which has been constructed over the years. Another dimension of the Islamic experience has been glossed as “mysticism,” although the notion of mysticism is an elastic one and carries connotations throughout the Islamic world much wider than the intensely personal and often esoteric pursuit of religious truths most commonly associated with the term.[344] In North Africa a key aspect of what is regarded as “mysticism” is maraboutism. Marabouts are persons living or dead (dead, that is, only from an outside observer’s point of view) thought to have a special .relation toward God which makes them particularly well placed to serve as intermediaries with the supernatural and to communicate God’s grace (baraka) to their clients. Maraboutism is an ideology (usually implicit) and the ritual activities associated with such a belief. Often marabouts are thought to be descendants of the Prophet Muhammad, of ^cUmar, the second caliph in Islam (634-644), or of other religious leaders attributed with baraka. Tribes and urban neighborhoods often have special ties with particular marabouts or with maraboutic descent groups, such as the Sharqawa of western Morocco.[345] The shrines of such marabouts can be seen throughout North Africa, and the significance of such figures is formally acknowledged in a variety of ways. Throughout North Africa it is common for persons going on the pilgrimage to Mecca first to visit the shrines or sanctuaries of local marabouts and to do so again upon their return (see Fig. 9-2). Such ritual activities suggest an integrated vision among believers of “local” religious practices with those of the “central” rituals such as the pilgrimage. There is in addition an array of religious brotherhoods (tariqa-s) and lodges (Ar. zawiya; Per. khdnqah; Turk. tekke) inadequately glossed as associated with “mystic” practices.

Mysticism in Islam is known formally as to<zwvw/and in the West as Sufism. A mystic—the ambiguities of this term as signaled above must be kept in mind—is known as a Sufi. The word Sufi is sometimes said to originate from the Arabic word for wool, referring to the coarse wool garments that early Sufis wore to symbolize their lack of concern for the things of this world. Sufi is also thought by some to derive from a word meaning “to be pure.” If s/Mn^c<z-minded Islam was primarily concerned with outward, socially perceived behavior and the well-being of the Islamic body politic, then Sufism in the abstract represents more of a concern with the social and spiritual life of the individual (and, as shall be seen, of specific social groups).

In the first two centuries of Islam, from the seventh to the ninth centuries, Sufism appears to have remained a largely individual phenomenon, but gradually it developed a mass appeal. [346] The first Sufi gatherings were reputedly informal gatherings, especially among literati, for religious discussions. These gatherings sometimes were associated with the repetition of religious formulas, called dhikr-s, but these also could properly be recited in mosques. Hence Sufism was not considered to be a rival growth challenging the formal practices of sh®f^c<z-minded Islam. (A later development was the addition of elaborate rituals, music, and dancing accompanying the dhikr, and these practices were regarded by some Muslims as a threat to the integrity of Islam.)

At first, organized Sufism appears particularly to have gained ground among the intellectual elite, constrained by the exigencies of shari^ca-minded Islam. Despite its stated apolitical objectives, Sufism was regarded from the outset as politically suspect (because of its potential for charismatic leadership), with political authorities sometimes using Sufi organizations for their own purposes or regarding them (often with cause) as being so used by others. The Sufi doctrine of the “inner way,” or the “spiritual itinerary” toward greater religious experience, was especially regarded as suspect since by its very nature it claimed a privileged religious insight independent of the community. As a consequence, Sufis began to develop formal disciplines and standard ways of depiciting their experiences. Regular stages in spiritual development were articulated in the classical theories of mystical thought, each of which was called a tariqa, or “path.” The same term also designates Sufi orders or brotherhoods.

In some versions of “classical” Sufi doctrine, the Sufi way consists of seven- stages of ascending spiritual insight. Most members of religious orders remain at the lower rungs of these spiritual paths. The upper level is said to be reached when a mystic, in a state of exaltation (half comprehends the divine attributes. Such persons are considered walt-s, or saints, and often were popularly attributed with the ability to perform miracles.

By the eleventh century, particularly in the person of the great scholar and mystic al-Ghazzali (d. Ill 1), a synthesis of intellectualized Sufi doctrine and short ^czz-minded Islam was reached. At the level of an educated elite, a beautiful poetry and literature developed around the notions of mysticism, particularly in the principalities of Muslim Spain and in the Persian-speaking regions of the Islamic world.[347]

In many of the accounts of Sufism written by Muslims and by Western scholars concerned primarily with textual analysis there is an unfortunate tendency to consider Sufi doctrine as practiced and elaborated by the educated elite as “pure” Sufism and later, popular developments as a corruption of this purer vision. The result is a distorted view of religious development which led an earlier generation of historians to write of the “decline” of the Muslim world rather than to recognize the multiple levels of religious experience in which the “spiritual” aspects of Sufi practice as interpreted by an elite were balanced by its functions as a sociopolitical movement intimately tied to other aspects of society.[348] A proliferation of Sufi “paths” developed which were internally differentiated and which appealed to different groups and social classes.

In North Africa, for instance, the Tijaniya order had numerous government officials among its adherents.[349] In Turkey the Bektashi order, founded in the thirteenth century, became particularly associated with the Janissaries, a professional military group that played an important part in the maintenance of the Ottoman empire until the early nineteenth century. The influence of this order was such that an estimated 10 to 20 percent of Turkey’s adult male population belonged to it just before 1925, when religious brotherhoods were outlawed in Turkey. Other orders were associated with particular crafts or trades. Some of these orders were considered highly respectable; others, such as the Hamadsha and the Haddawa, were associated with the use of drugs, trances, and activities considered marginal to the urban bourgeoisie.[350] Until the 1920s, the strength of these orders was such that the majority of adult urban males and many villagers belonged to a brotherhood in most parts of the Middle East. A popular saying was: “He who does not have a Sufi master as his guide has Satan to guide him.”

The organizational backbone of these orders is important to consider. At its core was the relation of the Sufi master (Ar. shaykh; Per. pir) to his disciple (mund in both languages). In formal doctrine, the disciple was supposed to be under the total authority of the shaykh, like a dead body in the hands of its cleanser. Additionally, local religious lodges were organized in a loose hierarchy ordered by the prestige of their shaykhs. But the larger these organizations grew, the more difficulties they had in controlling their members. Nominally subsidiary lodges were constantly breaking away, with their leaders acting on their own. The dyadic, or two-person, chains of personal authority inherent in the organization of the brotherhoods thus had a built-in weakness. Despite this fact, colonial ethnographers in the nineteenth and early twentieth centuries, especially in North Africa, conceived of the organization of these orders as monolithic “pan-Islamic” conspiracies which could be used by the Ottoman regime and rival colonial powers to weaken colonial rule.[351] In practice, it might be added, the authority of shaykhs over their followers was usually less than total, as is indicated among other things by the fact

that many individuals belonged to more than one order and that only a few orders required that their members join no other order.

The proliferation of Sufi “ways” and “saints” or marabouts cannot sufficiently be stressed. Bryan S. Turner has suggested the following contrasts with Christianity as a means of explaining the variety in scope and intensity of religious figures in Islam. In early Christianity, saintship at first was a local and spontaneous phenomenon, but saintship increasingly became tied to the institutional needs of a bureaucraticized church. By the medieval period, saints became officially recognized only after a lengthy process of canonization. There were three implications to this process. First, because of the length of canonization proceedings, persons became saints. only after they died. Second, since there were stringent tests of piety required. by ecclesiastical authorities, most saints were recruited from monasteries and nunneries. Finally, since trained theologians conducted canonization proceedings, theologians had a much better chance than illiterates for canonization.

In Islam, becoming a marabout stands in marked contrast to the Christian tradition, a principal reason why the term marabout is generally preferable to that of saint. First, with no formally recognized body of orthodoxy, the recognition of marabouts is invariably local, although some acquire widespread prominence. Secondly, while Christian saints tend to be orthodox, there is no orthodoxy to which marabouts can adhere. At best they can demonstrate orthopraxy and conform to an established ritual code. Finally, since there are no formal bodies for deciding who are marabouts, the process of labeling them varies widely. Sometimes a person is considered to be a marabout on the basis of descent from religious leaders, as on the basis of performing uncanny acts, outstanding feats of scholarship, or political success.

There is an “essential looseness,” to use Turner’s elusive phrase, about Islamic religious organization, which means that it is much more responsive to local social contexts than has often been the case in Christianity.[352] Religious orders and lodges accommodated the local beliefs and customs of their adherents, and this led to their sustained popularity in earlier historical periods. In fact, much of the spread of Islam throughout North Africa after the initial Islamic conquests was due to the actions of these orders and lodges. Some of the leaders of these orders and lodges based their legitimacy upon genealogies of spiritual authority which in form resembled the “teaching licenses” (ijaza-s) of men of learning. The source of their teachings could ideally be traced in these chains (silsila-s) of authority to the teachings of the Prophet himself. Other lodges claimed genealogical descent from the Prophet Muhammad. One such leader, the Sudanese Mahdi, Muhammad Ahmad (1844-1885), went so far as to model the major activities of his life upon those of the Prophet Muhammad as a means of convincing followers of his legitimacy.[353]

FIGURE 9-7 Members of Rifa^Tya Order parading in Cairo, Muslim New Year, 1965. (From Michael Gilsenan, Saint and Sufi in Modern Egypt: An

Essay in the Sociology of Religion [London: Oxford University Press, 1973]. Courtesy of the author.)

The reasons for the general decline of many of these orders by the earlier part of this century have been suggested by Michael Gilsenan. In 1964-1966 he studied one of the new Egyptian religious orders which continues to thrive, the Hamidiya Shadhiliya.[354] This order was established in the first decades of the twentieth century and formally recognized by the government in 1926. In the early 1960s, it had between twelve thousand and sixteen thousand members, concentrated for the most part in Cairo and in the larger towns of the Nile Delta;

Gilsenan's argument for the decline of the other Egyptian orders by the 1920s is the following. In earlier times, the orders provided an "organized associ- ational life" otherwise absent in many Islamic societies. As such, they served the function of being intermediaries between the highborn and the lowborn, rulers and ruled, as well as between persons at the same level of society.[51] As a result of basic changes in Egypt's political economy, the heads of the Sufi orders gradually lost their public and political influence. Professional politicians, landowners, lawyers, and journalists took over some of their functions, and various mutual aid societies were established to fulfill yet others. Additionally, the economic position of most of the orders was undermined as a result of government confiscation of some of the pious endowments (waqf-s), and the declining value of others on which they depended. This deprived the leaders of these orders of the resources with which to entertain their followers and to assist them when necessary. Moreover, Sufi teachings and ethics in their conventional form had become less and less responsive to the values of modern society. Many Sufi orders continue to be a major source of emotional gratification for their remaining adherents, but these adherents are now mostly peasants and manual laborers rather than the broader distribution of membership which they often had in the past, and younger Egyptians no longer seek to join most Sufi orders.

Gilsenan observes that the Hamidiya ShadhilTya order was an exception to this general decline. Significantly, its founder, Salama ibn Hasan Salama (1867- 1939), was a minor civil servant and as such was directly familiar with the demands of modern bureaucratic organization. He was largely self-taught but popularly respected for his religious learning and his claim to descent from the Prophet. Salama was a charismatic figure to his followers: A number of miracle stories circulated concerning him during his lifetime; he was reputed to be capable of confounding the religious scholars opposed to him, was known for his understanding of the "secrets" of Islamic mysticism, and was charitable and generous to his followers.

Organizationally, the Sufi order which Salama founded was set apart from the others. First, in contrast to the practice in other orders, the founder of the Hamidlya Shadhiliya thoroughly tested his early initiates, so that he had a hard core of subordinates who were thoroughly devoted to him. Salama demanded that his followers join no other brotherhood. Second, the order was successful in attracting a white-collar following as well as workers and peasants. Its doctrines and firm organization provide a sense of personal worth and security to “middle class” persons blocked in educational advancement (as are many educated Egyptians who hold clerical positions despite university degrees). Gilsenan characterizes most of its adherents as benefiting from, yet not wholly committed to, the new order of Egyptian society. Because of the lack of advancement opportunities, many individuals of humble origin who have had their occupational advancement blocked can find alternative satisfaction, he argues, in the order.[355] It offers the fraternal certitude and security which presumably were once provided by the “traditional” social order, yet is organizationally adapted to the exigencies of modern society.

A corollary organizational feature of the order is that each role in its hierarchy is carefully defined by written charter. Formal reports are required from its branches, and the members of the order are carefully controlled as to the nature of their public displays. While other groups exhibit ecstatic behavior in public, the Hamidlya Shadhiliya is carefully organized and disciplines its members in public and demands exemplary conduct from them. In return, even if a member is transferred from one town to another, the order keeps in touch with him and assists him in adjusting to his new environment. Gilsenan argues that adherence to the primary religious values of the order enables its followers to resolve implicitly the frustrations they find in other aspects of their lives in modern society. Moreover, new branches are authorized by the order’s hierarchy only after the order’s leaders are convinced that they will be successful. Publicly this increases their prestige. Such administrative efficacy is almost completely lacking in the other orders. The hierarchical control of the Hamidlya Shadhiliya order has enabled it effectively to overcome the problems of schisms and lack of control characteristic of the other orders.

*** Maraboutism: Town and Tribe

One factor in the proliferation of Sufi brotherhoods is the contrast between the requirements of formal, community-minded religion as opposed to a more personalized pattern of belief such as that provided by the religious orders. Other factors are the local conceptions of the social order and the popular understanding of religion. A key Quranic notion is that all persons are equal before God, despite the inequalities to be found in this world. Yet the activities of some religious brotherhoods and the often lavish offerings given to marabouts and their descendants in North Africa and similar figures elsewhere suggest that some Muslims implicitly act as if they accept a hierarchical conception of the relations between people and the supernatural.

How can the tenet of the equality before God be reconciled with the implicit notion of hierarchy? Analytically, an easy way out is to hold that any doctrine that suggests that all are not equal before God is a magical accretion to Islam. But from the viewpoint of tribesmen who make offerings and sacrifices to marabouts, such intermediaries with God are a part of Islam as they understand it. They regard themselves as Muslims, pure and simple, although they are aware of the disfavor in which such beliefs are held by Muslim scripturalists and reformists. Consequently, clients of marabouts often dissimulate their "local" beliefs in front of such persons, especially in contemporary contexts.

In essence, maraboutism involves the implicit assumption that whatever might be formally stated about Islam, human relations with the supernatural work in almost the same way as do relations among persons themselves. In the Moroccan case, for example, the implicit assumption concerning the social order is that people are related in personally contracted dyadic bonds of inferiority and superiority. In a nearly analogous fashion, marabouts are thought to have a "special" relation toward God and with particular persons or groups. For Moroccans and other North Africans who implicitly accept maraboutism, the main issue is not the existence of marabouts—that is taken for granted—but whether particular marabouts will choose to exercise their powers on one's behalf. They are more likely to do so if a client can claim "closeness" (qaraoa) to the marabouts or his descendants. Moroccans who hold this belief are aware that there is no place for it in "official" Islam, "the Islam of the radio," as one Moroccan put it.

Of course the radio says that everything comes directly from God. But just as the king has his ministers, God has his [marabouts]. If you need a paper from the government office, which is better? Do you go straight to the official and ask for it? You might wait a long time and never receive it. Or do you go to someone who knows you and also knows the official? Of course, you go to the friend, who presents the case to the official. Same thing ... if you want something from God.[356]

A range of offerings and sacrifices are made to marabouts and their descendants. Some, such as the sacrifice of bulls or sheep at the annual festival of a marabout are annual obligations which ensure that the social groups involved "remain connected" with the marabout and can count upon his blessings (baraka). Other gifts are given by individuals or groups in exchange for specific requests. These offerings often are contingent. For instance, it is common for women to go to certain shrines asking for the marabout's help in becoming pregnant. They may

FIGURE 9-8 "The radio says that everything comes directly from God. But just as the king has his ministers, God has his [marabouts]." Interior of Sidi Mhammad SharqT's shrine, Boujad, Morocco. (Courtesy of the author.)

tear a strip of cloth from their dress and attach it with henna to the door of a shrine as a “reminder” to the marabout. If the request is granted, then a sheep or other promised payment is made. At the larger shrines with attendants or descendants of the marabout acting as custodians, a hostel and even food may be provided for “visitors” (zawwar-€). The Arabic word for pilgrim (hajj) is not used to describe such visits; the pilgrimage to Mecca is considered conceptually to be a separate phenomenon. The modest offerings made by women on their own or their placing of “reminders” at such larger shrines is discouraged in favor of more substantial offerings in line with the “rank” of the marabout.

Such offerings are explicitly thought of in North Africa in terms of the ideology of “obligation” (haqq) which informs most other social relationships. As

FIGURE 9-9 Women often tear strips from their clothing to serve as "reminders" of requests to marabouts. Shrine near Boujad, Morocco. (Courtesy of the author.)

the descendant of one marabout explained: “You must bring a gift to ‘open’ a matter with God.” Offerings and sacrifices create a bond of obligation between the marabout and his client. Just as with other patterns of obligations, those between marabouts and their clients, even if sometimes discussed in terms of the ideology of “blood” relations, are subject to vicissitudes. The reputations of marabouts living and “dead” are as subject to revaluation on the part of the clients as are other concepts of social obligations.

Personal and collective ties with marabouts rest on a similar ideological base, but the collective ties merit particular attention because of the emphasis lavished upon them by anthropologists. Many tribal collectivities are specifically mentioned in popularly known myths, which serve to legitimate the ties between particular maraboutic descent groups and their clients. Such covenants are represented as being maintained through such means as annual sacrifices, the giving of women to prominent leaders of maraboutic patronymic associations, the claim of a common, distant ancestor between marabouts or their descendants and their clients, and the claim of mere physical propinquity in the distant past. [357]

FIGURE 9-10 Preparing amulets for sale at a mara- boutic shrine, Boujad, Morocco. (Courtesy of the author.)

So pervasive are the basic assumptions concerning the social order upon popular religious conceptions that notions parallel to maraboutism can be found in North African Judaism. Accounts of North African Jewish communities from the 1930s to the 1950s document saints' shrines, local festivals (called hillula instead of musim), and sacrifices. In fact, many of these communities continued maraboutic practices in modified form after emigration to Israel; in one case, members of the group averred that their saint/marabout had managed to emigrate with them.[358]

The understanding of Islam represented by maraboutic practice is rapidly becoming transformed by changing economic and political conditions. In the past, marabouts in North Africa exercised a wider range of economic, political, and social roles than is today the case. Marabouts and maraboutic descent groups previously served as mediators between tribes and the Sultan's court, secured the safe passage

FIGURE 9-11 Hillula of Rabbi Yahya, near Rabat, This rare photograph was taken in the early 1920s. (From J. Goulven, Les Mellahs de Rabat-Saie [Paris: Librairie Orientaliste Paul Geuthner, 1927], plate 21. Courtesy of the publisher.)

of commerce, and participated in many commercial ventures. At the same time, many marabouts were widely respected as religious scholars. Their popular reputations as miracle workers and politicians in no way diminished the respect that was accorded their religious learning. Marabouts frequently had extensive contact with religious scholars in the principal towns and elsewhere, and in some cases even tutored members of the royal family. Frequently there was a constant tension between royal and maraboutic authority, but the relationship was one of complementarity. Earlier social anthropological studies dealing with the role of marabouts prior to colonial intervention suggested that they placed an interstitial "balancing" role between segmentarily organized tribes in the absence of an effective centralized government. More recent research based upon a more detailed study of social historical documents suggests that this earlier view needs revision. The extent to which maraboutic centers were allied politically with royal authority had previously been underestimated. In addition, far from being in opposition to urbanbased religious scholars, many marabouts were respected by them and shared similar notions of Islam, even though popular understandings of their role were often at variance with "formal" Islamic precepts.[359] There was no sharp urban/rural dichotomy of belief and ritual practice but rather a continuum between the two.

The effect of the imposition of colonial rule and its consequent political and economic transformations was largely to circumscribe the scope of maraboutic powers. The political and economic roles of marabouts became almost negligible, although many individuals of prestigious maraboutic families were co-opted by the French into positions of local authority. Others, considered notables by the Protectorate administration, managed to use their position to acquire education, property, and the political influence necessary to maintain

their elite position. As the kinds of specific actions which marabouts or the descendants can successfully undertake have diminished, so has the importance given to maintaining links with them by various tribal collectivities. The size of offerings has diminished and so has the size of the clientele of particular maraboutic groups. Nonetheless, their importance as a component of Islam as locally received and understood is far from negligible even today. The festivals of major marabouts continue to attract tens of thousands of clients annually. Today's maraboutic clientele tend largely to be rural and tribal, but this circumstance in itself does not seriously reduce their numbers. Despite Morocco's rapid urbanization, over 60 percent of its population continues to be rural, with much of it often benefitting only marginally from participation in modem economic circuits.

Maraboutism is only one of a range of popular religious ideologies that defy firm classification but which form a component of popular religious understandings. In southern Morocco, for instance, resistance to the French as late as 1919 was led by a religious figure from a marginal social group claiming to be a mahdi, who continued to attack the French even after more established religious figures had sought accommodation with the colonial power. After the mahcfi died, the organization which he founded continued its resistance to the French until 1934.[360] The significance of such popular religious leaders has tended to be overlooked in part because of the reluctance of "establishment" religious scholars to recognize the strength of popular religious movements outside their control, the uneasiness of French military intelligence in comprehending such popular beliefs, and the fact that many foreign social anthropologists cannot readily assess the documentation on such leaders, most of which is in Arabic. As social anthropology increasingly becomes a "native" enterprise, significant modifications in how popular religious currents are depicted is certain to take place.

I have concentrated upon Morocco in discussing religious beliefs and "tribes" because in recent years anthropologists there have extensively debated the theoretical implications of how popular religious beliefs are related to the social order. However, earlier seminal studies exist for other regions. One of the first of these was Evans-Pritchard's The Sanusiya.[361] His main thesis is that the SanusTya managed to become the most significant religious influence over the tribes of Cyrenaica in Libya because the order's leaders effectively managed to adapt its structure to local tribal conditions, something which no other order managed to do. This may well be the case, but several cautions concerning Evans-Pritchard's elegant presentation, briefly introduced in Chapter 3, are necessary. First, he characterizes the tribes of the region as segmentarily organized yet provides no concrete examples of exactly how these segmentary principles worked or how the Sanuslya lodges were concretely articulated with the tribal structure. He provides a brilliant social history of Sanuslya resistance to the Italians, their relations with English military authorities, and how they ultimately became highly politicized The details of guerrilla activities against the Italians are fully comprehensible without recourse to his characterization of tribal social structure as segmentary. Surprisingly, Evans-Pritchard deals with the transition from the presumed segmentary structure of the tribes to their integration into a "political form ... on the model of the European state" in a mere two paragraphs.[5] ® Such a massive transformation of social form, if accurately depicted, merits more sustained consideration. Later studies of Islam in a tribal milieu, notably Lewis's account of the role of saintly lineages

in Somalia from precolonial times to independence, are significantly more successful in suggesting how Islam has adapted to specific political and historical circumstances.[362]

*** Men of Learning (^cUlama')

Some studies of Islam in rural and tribal milieus depict a single pattern of religious belief and practice. In the foregoing sections I have presented some of the reasons why it is more accurate to regard belief and practice as prismatic, generating and reflecting multiple influences, in both urban and rural contexts. This is why it is misleading to speak of firm divisions among various types of religious leaders— scholars, mystics, mahdi-s, and the like. In practice these analytic categories overlap. A scholar can become popularly regarded as a marabout for the quality of his learning and piety, and an unlearned person similarly can acquire a scholarly reputation at least in popular circles. One of the unifying elements in Islam as a religious tradition is the respect for those aspects of belief and ritual which are considered to be fixed and enduring. Thus in religious learning, there is a valued cognitive style, "a set of basic, deeply interiorized master-patterns of language and thought," which places great emphasis upon the accurate memorization and transmission of knowledge which is considered to be fixed.[364] The key exemplar of this cognitive style is memorization of the Quran. Respect for knowledge that is fixed and enduring pervades not only religious knowledge (^cilmj but the knowledge of secular subjects and skills (maSrifa). This attitude also produces a particular respect for the exact use of the spoken word and of stocks of set verses from the Quran, proverbs and poetry, and influences much of the popular music, rhetoric, art, and oral literature (both religious and secular) throughout the Muslim Middle East.[365] At least prior to Western economic and colonial penetration, a major source for the inculcation of this style was the mosque-universities at which advanced students learned the Islamic religious tradition and contributed to it. Schools such as the

Qarawiyih in Fez, the Yusufiya in Marrakesh, the ZItuna in Tunis, the Azhar in Cairo, and their equivalents in Mecca and the two Yemens, the IbadT Jabal Akhdar region of Oman, and Qum in Iran were all well known throughout the Middle East. Beginning with the nineteenth century, the financial base upon which many of these institutions depended was increasingly undermined both by "native" regimes such as Muhammad ^cAll's in Egypt and by colonial regimes such as that of the French in Algeria. Moreover, as European-style schooling, first provided only for specialized military training, rapidly expanded in scope and attracted students from the more privileged social strata and more ambitious poorer ones, Islamic schools were left to students of a modest and often rural origin. Some mosque-universities were "reformed," ostensibly to improve their curricula and standards but also to bring them firmly under government control, but these moves only accelerated their decline. Some mosque-universities continued to thrive until fairly recent dates—those of Morocco until the 1920s and early 1930s, those of the Yemen (San^ca') and the Sultanate of Oman until the middle of this century. Still, the social networks of influence and patronage formed in part through such mosqueuniversities have remained remarkably intact in many countries and the "cognitive style" conveyed by Islamic education retains a popular legitimacy.

The cultural idea of religious knowledge has remained remarkably constant over time throughout the regions of Islamic influence. Writing specifically of

FIGURE 9-12 Discussing a Quranic commentary, Ghazni, Afghanistan, 1973. (Courtesy Jon Anderson.)

medieval Islamic civilization, Marshall Hodgson states that education was “commonly conceived as the teaching of fixed and memorizable statements and formulas which could be learned without any process of thinking as such.”[366] This last phrase raises the crucial issue of the meaning of “understanding” associated with such a concept of knowledge. The supposedly fixed and memorizable statements conveyed by education constitute the religious sciences, the totality of knowledge and technique necessary in principle for a Muslim to lead the fullest possible religious life. These memorizable statements also constitute the most valued knowledge. The paradigm of all such knowledge is the Quran; its “mnemonic domination” (malaka l-hifd) is the starting point for the mastery of the religious sciences. To facilitate the task of memorizing other key texts of grammar and law, many of them are written in rhymed verse.

Because historians and sociologists have tended to take at face value the ideological claim in Islam of the fixed nature of religious knowledge, not much attention has been given to the critical topic of how such knowledge is linked with other aspects of society. In fact, Western scholars and many Muslims who have received a Western-style education merely assume that “stifling dullness” is characteristic of such education.[367] These extreme reactions to Islamic education suggest unfamiliarity with the principles upon which it is based.

Two linked propositions can be made concerning the form of Islamic knowledge. The first is that an intellectual tradition which emphasizes fixity and memory, as is characteristic of many other traditions of religious knowledge, can still be capable of flexibility. In practice there is considerable variation over time and place throughout the Islamic world as to the exact bodies of knowledge to be included in the religious sciences. Once this shifting is recognized, the interesting issue is the circumstances under which redefinitions occur as to what constitutes the proper scope of the religious sciences. The notion of what is meant by “tradition” in Islam, even the “high” tradition of scholarship and learning, may be fixed as to form and style (as the notion of what constitutes “valued” knowledge may be fixed in form and style in any educational system) but not as to content. If the compass of primarily religious studies appears unduly narrow, it was no more so than the curriculum of English public schools in the Victorian era, with their emphasis upon Greek and Latin, or of French lycees with their emphasis until recently upon classical training. As with the graduates of these institutions, former students of mosqueuniversities have become not only scholars but also politicians, ministers of state, merchants, and financiers who are quite capable of dealing with contemporary economic and political problems. Hence one must look beyond the mere scope of such learning to understand its significance.

The second proposition is that the cognitive style associated with Islamic education is closely tied to popular understandings of Islam and has important analogues in nonreligious spheres of knowledge. This formal congruence has served to enhance the popular legitimacy of religious knowledge and of its carriers but at the same time has shaped the ways in which changes are perceived. Earlier in this chapter I indicated how a Moroccan religious judge (qacfi) explained to me the notion of Islamic law in its jural sense and as a code for personal conduct. Everything within the two parallel lines which he drew on a sheet of paper were fixed— the content of Islamic law—everything else constituted innovation. Yet not all innovations are negative—they are tolerated so long as they do not explicitly contradict the principles of Islamic law. This formula might not be accepted by all Muslims, but it is one of the several means by which the notion of the fixity of tradition can be maintained while at the same time accommodating political and economic change. Most Muslims do not possess in fact an exact knowledge of the religious sciences but nonetheless share the assumption that religious knowledge is fixed and knowable and that it is known by men of learning.

Secular knowledge encompasses everything not included in the religious sciences, such as knowledge related to commerce and crafts, music and oral poetry. These last have significant parallels in form with the religious sciences and are also presumed to be contained by fixed, memorizable truths. Popular oral poetry takes this shape, just as effective public speech involves both the skillful invocation of Quranic phrases and the more mundane but memorizable stock of knowledge drawn from poetry and proverbs.[368] A further parallel is. in the model for the transmission of knowledge. The religious sciences in Morocco and throughout the Islamic world are thought to be transmitted through a quasi-genealogical chain of authority which descends from master or teacher to student to ensure that the knowledge of prior generations is passed on intact. Knowledge of crafts is passed on in an analogous fashion. The measure of “understanding” appropriate to such forms of knowledge is its use, often creative, in wider social contexts than those provided by the milieu of learning itself or by the abstract manipulation of memorized material in “classroom” situations, as is characteristic of some contemporary education in the West.

Any analysis of learning in Islam must convey an idea of how many persons were traditionally educated and who they were, in order to understand the contemporary role of religious learning. The first years of study in Islamic education consisted of memorizing and reciting the Quran; only at later stages did the more advanced students learn to read and write, usually outside the context of the mosque school. In many rural areas that lack adequate “modem” schools, such schools remain the only available form of education. Contemporary literacy is difficult to measure, let alone the literacy rates of earlier periods, but approximate t

estimates are necessary to indicate the scope of Islamic education. Thus for Morocco for the 1920s and 1930s, it appears reasonable to assume that 4 percent of the adult male rural population was literate, allowing for regional variations, and j perhaps 10 to 20 percent of

the adult male urban population. My own estimate is that similar figures would prevail for Oman, a country which possessed only three “modern” primary schools as late as 1970 and in which most education was necessarily carried out in mosque-schools.[66] i

Religious learning was popularly respected, yet Quranic schools in their j traditional settings were characterized by a high rate of attrition. Virtually every ?

urban quarter and rural/tribal community maintained a mosque school, as is still \

the case, for which a teacher (faqih) was contracted on an annual basis to teach and]

to perform certain other religious services. Most students attended such schools 5

only long enough to commit to memory a few passages of the Quran; few remained j for the long time necessary to memorize the entire Quran.

The formal features of these schools have frequently been described; although | the consequences of the form of pedagogical action upon modes of thought have only begun to be critically explored. A typical teacher had between fifteen to i twenty students in his charge, ranging widely in age. Printed or manuscript copies of the Quran were not often used, in part because of the lack of printed copies but also because the cultural concept of learning emphasized memorization. Each morning the teacher wrote on a slate the verses to be memorized by the student. The child then spent the rest of the day memorizing these verses and systematically reciting the verses learned earlier. Students were not grouped into “classes” based on age or on progress in memorization.

Two features consistently associated with Islamic education are its rigorous discipline and its lack of explicit explanation of memorized material. Both of these features are congruent with the concept of knowledge as essentially fixed and, of course, with the notion of reason (^cqal) as the ability to discipline one’s nature, as explained in Chapter 8. The firm discipline of Quranic education was thus just one of many ways in which the respect for the unchanging word of God could be inculcated in students. At least in Morocco, it is popularly believed that any part of a student’s body struck in the course of memorizing the Quran will never burn in hell. To indicate the parallel with secular knowledge, the same notion applies to beatings given by a craftsman to his apprentice.

As to the “explanation” of what is memorized, former students of traditional Islamic education have emphasized to me that throughout the long process of

[66] Sources for the Moroccan estimate are provided in Eickehnan, “The Art of Memory,” ;

492. Fanny Colonna, Instituteurs Algeriens: 1883-1939 (Paris: Presses de la Fondation Nationale des Sciences Politiques, 1975), p. 30, suggests that around 40 percent of Algeria’s male population could read and write just prior to French conquest in the 1830s. Under the French, literacy suffered a precipitous decline because of the systematic destruction of educational institutions.

memorizing the Quran, often six to eight years, they did not ask questions directly concerning its meaning, nor did it occur to them to do so, even when Arabic was not their first language. “Understanding” in the context of such concepts of learning was not measured by any ability to “explain” particular verses explicitly. Such explanation (tafsTr) was considered to be a science in itself. Instead, the measure of understanding was implicit and consisted of the ability to use particular Quranic verses in appropriate contexts. Originality was shown by working Quranic references into novel but appropriate contexts, just as knowledge and manipulation of secular oral poetry and proverbs in a parallel fashion were also the signs of good rhetorical style. This notion of style continues to hold in many parts of the Muslim world.

The high rate of attrition from Quranic schools suggests that mnemonic “possession” of the Quran and related texts can be considered to be a form of cultural capital. Aside from small traditional gifts by the parents of the children to their teachers, Quranic education was free. Yet most students were compelled to drop out after a short period in order to contribute to the support of their families or because they failed to receive parental support for the arduous and imperfectly understood process of learning. In practice, memorization of the Quran was accomplished primarily by the children of relatively prosperous households or by those whose fathers or guardians were already literate. I say “primarily,” for education was still a means to social mobility, especially if a student managed to progress despite all obstacles through higher, post-Quranic education. Moreover, the children of the- wealthy and powerful had more opportunities to observe gatherings where the proper use of educated rhetorical style was employed than did poorer students. In fact, the biographies of men of learning repeatedly stress the importance of their family milieu in successfully mastering the traditional texts.

Magic Invocation and Charm.

"Tarshun! Taryooshun! Comedown!

Come down I Be present! Whither are gone the prince and his troops ? Where are El-Ahmar the prince and his troops ? Be present ye servants of these names!”

“And this is the removal. 'And we have removed from thee thy veil ; and thy sight to-day

is piercing.’ Correct: correct.”

FIGURE 9-14 Even among illiterates, writing is highly respected. Invocation for an amulet. (From Edward William Lane, An Account of the Manners and Customs of the Modern Egyptians [London: John Murray, Publishers, Ltd., 1860], p. 269.)

The scope of traditional higher education is also significant to consider because of the importance attributed to men of learning in many accounts of the social structure of “traditional” Islamic society. For Morocco in 1931, the year of the first reliable census in at least the French-controlled part of the country, such students constituted a minuscule 0.02 percent of the population.[369] Moreover, since most students left their studies after a few years to become merchants, village teachers, notaries, and the like, the limited number who eventually could claim to be men of learning is readily evident. Mosque-universities in their “traditional” sense (that is, before the al-Azhar reforms of the late nineteenth century and those of Morocco in the 1930s) constituted institutions in the basic sense of a field of activity whose members shared subjectively held ideas and conventions as to how given tasks should be accomplished. In the first place, the use of space in such mosque-universities indicated their lack of separation from the rest of society. Lessons were conducted in the same space used by the wider community for purposes of worship and other gatherings. Onlookers or persons seeking merely to acquire God’s blessings by being close to persons discussing religious texts were free to join the lesson circles. Mosque-universities had no sharply defined body of students or faculty, administration, entrance or course examinations, curriculum, or in most cases unified sources of funds. Teachers (shaykh-s) did not form a corporate group as they did in medieval Europe, although older and respected shaykh-s served as spokesmen for their colleagues on various occasions. In some parts of the Muslim world, shaykhs were formally appointed, but this was just as often not the case. The lack of formal appointment meant that younger scholars had to be especially scrupulous about comporting themselves in ways expected of men of learning and commenting on texts in expected ways in order to demonstrate their claims to be men of learning. Moreover, the formal lesson circles of the mosqueuniversities often provided virtually no opportunity for students actively to acquire, the skills needed to master the rhetorical skills expected of men of learning or to learn the poetry, history, and literature which such men were often expected to learn but which were not formally taught in the public lesson circles of the mosques themselves.

As in any educational system with diffuse, implicit criteria for success, and in which essential skills were not fully embodied in formal learning, the existing elite was favored and certain families often became distinguished for their learning over generations. This was especially so as many of the essential skills needed by educated men were acquired through peer learning and through acquiring the sponsorship of established men of learning. In such activities, students from urban families which already contained men of learning or influence were at a competitive advantage. Students from rural regions were at an initial disadvantage, although once again those from families of rural notables were in a better situation. It was often through peer learning that new interpretations of Islamic tradition, such as the reformist (Salafiya) movement of the late nineteenth and early twentieth century first became disseminated. As such learning was strictly informal, it also was extremely difficult for political authorities to monitor. In addition, teaching licenses tended to be perfunctory documents; what counted was sponsorship by influential men of learning and acquiring public recognition, usually from persons not themselves in scholarly circles.

Despite the great respect in which religious learning and men of learning are held in many parts of the Islamic world, the majority of students at traditional mosque-universities rarely ever used such knowledge in more than an iconic fashion, as a marker of participation in the milieu of learning. When in the course of my own research in Morocco I asked former students of such schools why they left their studies rather than remain in the scholarly milieu, most expressed a formal sense of regret, but few considered such “attrition” to be a failure on their part. Instead, most emphasized the opportunities their years at the mosque-university created to secure ties with persons within and outside the community of learning. These ties often were of use later in facilitating commercial, political, and entrepreneurial activities. Most of them stated that their intention in participating in the mosque-university milieu in the first place was to acquire knowledge of the religious sciences. The response was to be expected given the cultural emphasis placed upon such valued knowledge. Acquiring the religious sciences additionally implied participation in social networks with persons drawn from different backgrounds and regions of the country and thus actual or potential access to a wide range of centers of power. No other preparation, except perhaps association with the sultan’s entourage, enabled a person to acquire such a wide range of potential associations. Knowledge of the religious sciences was of course a necessary technical prerequisite to performing certain tasks, but these did not begin to exhaust the meaning of education. Acquiring such knowledge also provided the conspciational base from which a wide range of extralocal political, economic, and social activities could be undertaken, at least so long as there were no major alternatives to Islamic higher education.

In many contexts throughout the Middle East until recent times, Islamic men of learning were in the heart of political affairs. If a new ruler was to be recognized, the men of learning of each town conveyed or withheld the oath of allegiance of the population to the new sultan. Popular protest often began at the mosqueuniversities, even though it usually was not initiated by men of learning themselves. Since men of learning tended to be members of the social elite and at the same time appropriated for themselves the symbols of legitimacy provided by religious scholarship, they often represented the will of the population to the government and the intentions of the government to the populace. If the government

performed acts which men of learning considered outside the bounds of Islam and if the men of learning were capable of withstanding the ruler's displeasure, the ruler was often compelled to change his course of action. As Albert Hourani has cogently argued, because men of learning had access to rulers, they acted as popular leaders, and because their popular religious legitimacy gave them autonomous authority of their own, rulers needed them and were compelled to listen to them. "But for this reason, [their] modes of action must in normal circumstances be cautious and even ambiguous" so that they do not appear to be either the instruments of authority or the enemies of authority. Hence men of learning usually chose to exercise their influence discreetly in private. Hourani in fact uses the term "patrician politics" to characterize the nature of their influence.[370]

A number of excellent studies by social historians and anthropologists on the role of men of learning in various Muslim communities have recently become available.[371] One of the first of this "new wave" of accounts is Ira Lapidus's study of medieval Damascus from the thirteenth through the early sixteenth centuries.[372] Because most of these studies implicitly suggest the importance of ties of personal dependence in both urban and rural contexts and the importance of informal patterns of authority, they suggest key continuities in patterns of authority and legitimacy with many modem situations. In Lapidus's description of medieval Damascus, no special interest group could entirely stand apart from the men of learning or fail to be represented by them. They did not form an organized, collective body and were drawn from heterogeneous origins. Some represented scholarly circles, others important and wealthy families, others major religious brotherhoods appealing to various social groups. The multiple informal roles they played held society together in the sense that this informal body had contact with virtually all elements of society. They had no military power and thus could not defend cities, nor could they always suppress violence. Yet their informal consensus provided the legitimacy and moral authority needed by any ruler to survive or conversely to legitimate popular protest.

In every case where alternatives developed to higher Islamic education, mosque-universities quickly lost their former vitality. Even when families which produced men of learning continued to predominate, it was because of their ability to adapt to new circumstances. In almost every instance, the sons and daughters of such men of learning have been given "modem" education in the light of changing circumstances. However it is still appropriate to say that the popular legitimacy of the form of knowledge conveyed by Islamic education and its carriers remains largely intact, as shown collectively by the sustained prestige accorded to men of learning in Iran and in certain other contexts in the Muslim world.

In the past, the memorizable truths of Islamic learning were passed from

generation to generation. Since the collapse of most Islamic higher education, this j is no longer the case. So far, this collapse of the "technology" of intellectual reproduction has had no pronounced effect, but, as elsewhere, major changes in educational systems take a long time to have a widespread impact. Popular respect] for the concept of Islamic knowledge as

fixed and memorizable and the cognitive 1 style represented by such education remains largely intact, as does respect for what j in many cases may be the last prestigious generation of its carriers.[71]

The shift of religious knowledge from that which is mnemonically possessed j to material that can only be consulted in books suggests a major change in the nature of knowledge and its carriers. Ideologically it may still be maintained that]

religious knowledge is memorizable and immutable, as is certainly the case for the j word of God as recorded in the Quran, but the lack of concrete embodiment of this ! premise in the carriers of such knowledge indicates a major shift. This shift may not be consciously recognized, just as many Muslim intellectuals claim that the imposi- i tion of colonial rule in many regions had little impact on the belief and practice of Islam, which from a sociological point of view is decidedly not the case.[72] One of the crucial consequences of this shift is that socially recognized carriers of religious learning are no longer confined to those who have memorized authoritative texts in ' circumstances equivalent to those of the mosque-universities, with their bias toward favoring members of the elite. Those who can interpret what Islam “really” is are ? now of more variable social status than was the case when mnemosyne was an essential feature of the legitimacy of knowledge. The carriers of religious knowledge in Islam increasingly are persons capable of claiming a strong Islamic commitment; freed from mnemonic domination, religious knowledge can increasingly, be delineated and interpreted in a more abstract and flexible fashion. A long apprenticeship under an established man of learning is no longer a prerequisite to legitimizing one’s own religious knowledge.

*** Reform: The Self-Renewal of Islamic Tradition

The dates in the title of Albert Hourani’s Arabic Thought in the Liberal Age, 1798-1939 suggest indirectly that the main impetus for reform in Islamic thought was the challenge of Western encroachment upon the area.[73] Egypt was for a long time

71

For contemporary examples of such style translated directly into English, see the speeches contained in the First World Conference on Muslim Education, Conference Book, 31 March - 8 April 1977 (Mecca and Jeddah: King Abdul Aziz University, 1977). /

[72] For a highly intellectualized example of implicit colonial influence, see Sayyid Amir ^cAli's influential The Spirit of Islam (London: Christopher's Ltd., 1922), in which the Prophet Muhammad is portrayed with all the virtues of a Victorian gentleman. The author, a leading Muslim modernist, was a civil servant in colonial India and wrote in English. See also Dale F. ; Eickelman, "Islam and the Impact of the French Colonial System in Morocco," Humaniora Islamica, 2 (1974), 215-35.

[73] Albert Hourani, Arabic Thought in the Liberal Age, 1798-1939 (London: Oxford University Press, 1967). ; the center of such reformist activities. The influence of nineteenth-century intellectuals upon the Islamic body politic was a profound one, and such activities as the "organization" (nizam)—the word reform was scrupulously avoided—of the al- Azhar mosque-university had a profound if delayed impact. It was toward the end of the nineteenth century through the 1930s that reformist Islam began to gain popular momentum. In Morocco, the impetus was linked with the impending threat of European penetration. Reformist thought primarily spread in the circles of intellectuals connected with the sultan's court and among educated merchants of the urban bourgeoisie informally linked with the milieu of the mosque-university. It took the form both of the dissemination of the ideas of religious reformers from the Arab "East" such as Jamal ad-Dih al-Afghanl (1839-1897) and Muhammad ^cAbduh (1849-1905), both of whom attracted disciples throughout the region. Certain religious brotherhoods with modernist tendencies appealed significantly to members of the mercantile and administrative elite.[373]

The concern of this account is primarily with the popular impact of reform or modernist Islam. Ideologically, the essence of the movement was to divest Islam of what the reformers considered to be its particularistic accretions and to return to the essential principles of faith; hence the name of the movement in Arabic, Salafiya, which suggests a return to the Islam of the venerable forebears. In Islam it is common for both modernists and conservatives to justify their ideological position by emphasizing that it is a return to essential principles and not an innovation. Clifford Geertz has suggested an association between the crystallization of regionfocusing markets in Morocco and the rise of reformist Islam and religious brotherhoods with modernist tendencies. In my own work in western Morocco, the major popular spread of reformist ideas came in the 1930s. The principal carriers of these ideas were urban merchants, many of whom had been associated with mosqueuniversities. Reformist Islam gave them an ideological base to challenge the domination of a maraboutic family influential in the region which formerly also controlled much of the commercial activity. The Islam which they propagated was one of coherent doctrines based on clearly stated, universalistic grounds, as opposed to the traditional, largely implicit, maraboutic belief system. In many regions, reformist Islam became in part a vehicle for asserting autonomy from the dominant groups of earlier generations and in addition became a prototype for the nationalist movement.[374] Organizationally, it was common in the 1930s for merchants and craftsmen caught up with the reformist movement to set up loosely knit, ephemeral committees to negotiate various matters with the local administration, such as the construction of schools. Reformist Islam had few adherents in this period, but the few tended to be members of influential families. In contrast, marabouts and their supporters were too tied to the particular circumstances of the local communities

to serve as vehicles for an emerging national consciousness or the practical imple- j mentation of a nationalist movement.

The reformist movement in Algeria is one of the best documented in terms of ; its popular spread. As Ali Merad has written, before the emergence of the reformist movement virtually no Algerian Muslim thought that Islam was anything except maraboutism.[76] Marabouts were the only religious spokesmen for most Algerians and the only alternative to them was a "clergy," subsidized by the French, that was officially authorized to conduct Friday prayers in the mosques of the country. In the Algerian case, an initial impetus for the reform movement was the brief visit of the Egyptian reformer Muhammad ^cAbduh to Algeria in September 1903. ^cAbduh's local contacts, although few, were with Algerians influential in religious 1 circles. The popular impact of the reformist movement accelerated after World War 3 I with the return of Algerians who had fought with the French and who were disillusioned with resuming their former subservient status. Algerians from all parts of j the country began to recognize their common situation despite linguistic and regional differences. (Perhaps an unintended byproduct of French rule was to bring "natives" of different regions into more contact with one another.) Distant problems became more familiar, and Algerians began to think actively in terms of a national community. The term "Young Algerian" began to be used, in parallel with the term "Young Turk" for the Ottoman province of Anatolia. The small Algerian cadre of French-trained schoolteachers, doctors, journalists, and attorneys formed 3 the vanguard of this movement, but their direct influence upon other Algerians was limited by their minimal contacts with Algerians who were not so trained and an j inability to communicate effectively with this vast majority. Because marabouts I and the "official clergy" had supported the French against the Ottoman empire s (allied with the Germans) during the war, they rapidly lost popular support. A number of Algerian reformist leaders emerged, of whom ^cAbd al-Hamid ibn Badis (ben Badis) (1889-1940) was the key and representative leader. Ibn Badis was from 3 a leading family of Constantine. Immersed in Islamic scholarship, he was influenced J by reformist ideas from the Arab East and maintained active ties with Algerians from many walks of life. The high social class of these reformers meant that the French dealt circumspectly with them. Reformists began to visit mosques throughout Algeria, emphasizing in their preachings the unity of Islam, charity, worship, and mutual assistance. While trying to avoid direct confrontation with the marabouts, who were often strongly embedded in local political networks, they challenged the maraboutic claim of communication with the Prophet, their power of intercession and miraculous healing, and magic and sought to convince Algerians that these notions were not part of good Islamic doctrine. By 1933 the French administration had become concerned about the reformists and placed restrictions on them, especially as some of them had become directly involved in the incipient 3 nationalist movement.

[76] Merad, Reformisme, p. 58. See also Ernest Gellner, "The Unknown Apollo of Biskra: The Social Base of Algerian Puritanism," Government and Opposition (London), 9 (1974), 277-310, which contains an excellent analysis of Merad's work.

Merad makes two major points. First of all, maraboutism was the backdrop against which reformist ideologies in Algeria were forged and elaborated. No matter how many educated Muslims deride the implicit assumptions of maraboutism today, the maraboutic interpretation of Islam was a major force in the 1930s and in many parts of North Africa continues to play a significant role. Secondly, reformism mounted an offensive of educated urban interpretations of Islam, “intelligible and simple,” against a tribal and rural religious orientation: Merad argues that consciously or not, urban values impregnated the religious conceptions of the reformist movement and paved the way for “rationalist” conceptions of Islam. He goes so far as to say that without intending to do so, the carriers of reformist Islam managed to secularize Islam by conveying it as doctrines and practices set apart from other aspects of life and to popularize “confused” notions of modernism.[375]

It is possible to argue, as has Wilfred Cantwell Smith, that there has been a tendency in the Islamic world as in the Christian one for religious traditions that once were “coterminous with human life in all its comprehensiveness” to become transformed so that now “the religious seems to be one facet of a person’s life alongside many others.”[376] Still, it is important to recognize that the reformist movement, by simplifying religion and making it popularly intelligible, also made it a universal vehicle for national and wider anticolonial identities. In fact, it is significant that Mu^cammar al-Qadhdhaff, the “teacher-leader” of Libya, proclaims himself a devout Muslim, yet his Green Book, two pocket-sized tracts concerning social justice and economy, never explicitly mentions Islam. The language of the Arabic version makes clear his reliance upon key themes of Islamic modernism but not upon organized Islam or its men of learning.[377]

The richness of modernist and reformist movements in contemporary Islam is too great to allow a detailed survey here, but another important component of the emerging “essential” Islam of the educated middle classes is a militancy against what they see as any religious compromise or temporizing. In the vocabulary of Ernest Gellner, it can be considered to be a sort of Islamic puritanism.[378] One of the best known of such movements is the Muslim Brotherhood (al-Ikhwan al-Muslimun) of Egypt, founded in 1928. The Muslim Brothers appropriated for themselves the right to challenge organized political authority, and, as a consequence, the movement was forced to go underground several times. Equivalent movements have been created in other Middle Eastern countries and in many cases exercise a strong political influence. This is a movement perhaps more politically committed than other forms of Islamic modernism, although as indicated earlier, other versions of

Islamic reform (or for that matter Islamic conservatism) also carry strong political implications.[379] The founder of the Muslim Brothers in Egypt, Hasan al-Banna, was born in 1906. His father had been educated at the Azhar, earned his livelihood as a watchmaker, and passed his piety and classical learning on to his son. From the time he entered primary school, Hasan al-Banna was involved in different religious societies and became strongly interested in Sufi teachings. As with other educated youth of the 1920s, he constantly discussed with his associates the state of Islam and the nation and was concerned with the defection of many of the educated from the Islamic way of life. When he founded the Muslim

Brotherhood, he was held in personal veneration by many of his followers. Members had to swear complete obedience to the movement, although there were degrees of membership. At the same time, there were punishments for negligent members, so the society had a built-in discipline which set it apart from other religious associations and political movements. Because the organization implicitly made no distinction between the political and social order and called for the purification of society, successive governments saw it as a revolutionary force.[380] The organization was suspected of and actually was involved in considerable political violence.

As for the ideology of the movement, Richard P. Mitchell has characterized it as “the first mass-supported and organized, essentially urban-oriented effort to cope with the plight of Islam in the modern world.”[381] Mitchell sees a continuity between earlier reform movements, including the Wahhabi movement of eighteenth-century Arabia. Members of the movement see themselves as practical successors to the reformist ideas of earlier leaders such as al-Afghanf. The goals of the Muslim Brotherhood include renewed unity of the Muslim community and an appeal for personal reform as a prelude to making the Islamic community realize its full potential for development in the modern world. Their starting point for this revitalization is Islam and its tradition. Western influences are not excluded but are accommodated only insofar as they can be harnessed to the service of an “integral” Islamic code of behavior. Such ideological notions are very much in line with contemporary Saudi thinking, which is one of the reasons that “integralist” and fundamentalist movements reflecting ideologies similar to the Muslim Brothers appear to receive active financial backing from the Saudi state throughout the Middle East. Saudis evidently see such government as more congenial to their own political and religious interests than other forms of radicalism.®*

As Mitchell indicates, it is difficult to ascertain with any precision the social origins of a quasi-secret organization, but available documentation suggests that despite its large rural membership, the Egyptian brotherhood was dominated by urban activists. These activists were in addition predominantly from the urban middle class. Mitchell attended many of the open meetings of the Brothers between 1953 and 1955 and reports that he saw a fairly regular pattern of attendance: servants, merchants, craftsmen, and a few Azharites but an “overwhelming majority” of students, civil servants, office workers, and professionals in Western dress—in short, “an emergent and self-conscious Muslim middle class” hostile to imperialism and its “internal” agents and interested in conservative reform and the reinstitutionalization of religious life as they conceive it.[383]

In discussing modernist trends in Islam it is easy to convey the impression of highly organized movements with clearly articulated ideologies and political goals. Certainly such movements have been a significant component of modernist tendencies and suggest the continuing capacity of Islam to encompass a variety of social situations. Patterns of financial backing from certain conservative Arab states interested in encouraging political thought which parallels their own interests make such organizations perhaps even more visible.[384] Yet such movements do not exhaust the range of religious expression, which in times of crisis even can cross the boundaries of major world religions.

One such event was the widespread belief in Egypt that the Virgin Mary appeared over a church in a suburb of Cairo from April 2,1968 until several years later.[385] Thousands of pilgrims flocked daily to the site hoping to see the miracle. As Cynthia Nelson relates, the Virgin commands the respect of both Muslims and Christians in Egypt. Soon after the first apparition, the Coptic Patriarch of Egypt and All Africa announced at a press conference that the Virgin's appearance was real. The government subsequently took formal notice of the event. What is significant about the apparition is the way that it served as a symbol of unity for many Egyptians. Most Egyptians connected the apparition of the Virgin with the Six- Day War of June 1967, "a military defeat that left the country in despair and its people confronting perhaps the severest crisis in their contemporary history."[386] Both Copts and Muslims saw the Virgin as having come to extricate them from their crisis. Copts interpreted her appearance as reaffirming their role in the future of Egypt to the Muslim community. Many educated students and others who had lost their faith, whether Christian or Muslim, interpreted the event either as a ruse of a foreign intelligence agency (the presumably ubiquitous CIA) or alternatively as a warning to restore their faith in the non visible and nonrational. Again, the form of the transcendent is tied to the nature of political and social realities.

*** Beginnings

The flexibility and capacity for self-renewal of Islam are perhaps nowhere more clearly exemplified than in the formation of the early Islamic polity in seventhcentury Arabia. In fact, because of the attention lavished on the events of this period by generations of scholars, the origins of Islam are in some respects more fully documented than the beliefs and religious practices of some contemporary Middle Eastern societies. Moreover, much of the key primary literature has been translated into English, so that it is readily accessible to nonspecialists.[89]

In thinking of the great world religions and the polities associated with them, there is a tendency to gloss over their tentative beginnings and to see them as emerging intact in the forms by which they are later characterized. Admittedly the early rise of Islam was spectacular. At the death of Muhammad in 632, many tribesmen and oasis dwellers on the Arabian peninsula interpreted their pledge of submission to Islam as a personal covenant with Muhammad from which they were released upon his death. The fact that Muhammad left no clear successor led further to the temporary disarray of the nascent Islamic state (a "disarray" which incidentally is invaluable analytically for suggesting the popular bases of the strength of ; Islam). Yet by 634, most of Arabia was firmly within the Islamic polity, and the major conquests had begun. By a.d. 700, all of North Africa and Persia had been

[89] A good place to begin a consideration of this period is with W. Montgomery Watt's two volumes, Muhammad at Mecca (Oxford: Clarendon Press, 1953) and Muhammad at Medina (Oxford: Clarendon Press, 1956). These volumes are preferable

to a later abridgment, Muhammad: Prophet and Statesman (London: Oxford University Press, 1961) because they clearly indicate the nature of the sources and how they can be used. Watt's own interpretations should, however, be regarded with caution (for example, he avers that marriage patterns suggest vestiges of a "matriarchate"). Three explicitly anthropological analyses of this period exist. The earliest is Eric Wolf, "The Social Organization of Mecca and the Origins of Islam," Southwestern Journal of Anthropology, 7 (Winter 1951), 329-56. Two later accounts are Barbara C. Aswad, "Social and Ecological Aspects in the Formation of Islam," in Peoples and Cultures of the Middle East, Vol. 1, ed. Louise E. Sweet (Garden City, N.Y.: Doubleday & Co. for the Natural History Press, 1970), pp. 53-73, and Dale F. Eickelman, "Musaylima: An Approach to the Social Anthropology of Seventh Century Arabia," Journal of the Economic and Social History of the Orient, 10 (1967), 17-52. Wolf and Aswad concentrate upon the economic and ecological background to the rise of Islam; Eickelman is concerned primarily with contrasting notions of prophetic authority and their relation to the tribal structure. The "Musaylima" article also lists the primary sources which have been translated into English. Maxime Rodin- son's "The Life of Muhammad and the Sociological Problem of the Beginnings of Islam," Diogenes, 20 (1957), 28-51, and his "Bilan des Etudes mohammadiejjnes," Revue Historique, 229 (1963), 169-220, provide highly valuable reviews of the sources for the study of seventhcentury Arabia and how scholars have used them. See also his Mohammed, trans. Anne Carter (New York: Vintage Books 1971 [French original 1961]) which provides an overall study of the period. Most studies of the period rely principally upon Arabic sources or translations of them. However, Patricia Crone and Michael Cook's Hagarism: The Making of the Islamic World (Cambridge: Cambridge University Press, 1977), radically (and unevenly in my judgment) reinterprets the origins of Islam by relying upon Byzantine and other non-Arab sources. A major change in scholarly knowledge of this period may emerge as it becomes known archaeologically. Archaeological research now being conducted in Saudi Arabia and the Arab Gulf states promise to transform what is now known of trade and political relations of the pre-Islamic period.

252 J conquered, and in less than a century after the Prophet's death, the Islamic empire had expanded beyond Persia to India (a.d. 713) and west into Spain (a.d. 711).

The argument throughout this chapter has been that ideologies, even prophecies, are communicated in the context of particular economic and social conditions and are profoundly affected by them. A discussion of the rise of Islam, especially in the period from when Muhammad first revealed himself as a prophet to the years immediately following his death, provides a privileged insight into the relation between ideology and practice because of the abundant documentation of primary sources.

The first thing to note is that Arabia was not a tribal backwater in the sixth and seventh centuries as it has at times been represented. Research in recent years has firmly established that the trade routes crossing the Arabian peninsula were crucial for an expanding long-distance trade and that this commerce was conducted through complex, sophisticated links between nomads and settlers on the peninsula, who in turn had ties with

the surrounding great empires. None of the surrounding empires, however, managed to establish firm control over the peninsula itself. Thus the Sassanian (Persian) empire occupied South Arabia around a.d. 570-575 in an effort to safeguard the trade routes but was unable to expand its domination over the rest of the region. The Byzantine empire was more realistic in what might be called the Arab policy. It refrained from any direct military involvement in Arabia, although it encouraged the Abyssinian empire, a Christian ally, to conquer the Yemen in 525 and to conduct a raid (unsuccessful) on Mecca soon after.

In the century before the rise of Islam, Arabia was surrounded by a ring of “buffer” or client states heavily influenced by the ideologies of the dominant powers. Internally, there were Jewish settlements engaged in agriculture and commerce, as well as Christian monks and monasteries. Thus in one of the states allied with the Byzantine empire, Monophysite Christians had success in converting the seminomadic Arab population to their beliefs. Rather than relying solely upon a highly trained priesthood in urban centers, the Monophysites ordained large numbers of priests with little training so that each encampment had a “native” clergy present to perform rites. The ability of the Monophysites to adapt structurally to tribal conditions in Cyrenaica was a key factor in attracting tribal allegiance.[387] In other client states, the rulers bore titles such as king (malik). This is an important consideration, for in the Quran and in other sources for seventh-century Arabia, Muhammad is made to convey revelations denying that he aspires to be a “king” of the Arabs. Such patterns of leadership were clearly known to Muhammad’s potential supporters, even if not accepted as legitimate by them.

This whole system of buffer states suffered a serious decline in sixth- and seventh-century Arabia, resulting in a major loss of trade. In the late sixth century the Sassanian and Byzantine empires engagedin conflicts with each other. In 628, Khusraw, the Sassanian emperor, died, and in Persia there was a violent internal struggle for power. It was during this period that the Muslim conquests began in i earnest.

Where did Mecca fit into the political and economic realities of this time? The first permanent settlement at Mecca appears to have been established about a.d. >

400. The settlement was much as it is today: barren and arid. There was no agriculture in the immediate region and water was scarce. It is difficult to think of Mecca even in pre-Islamic times except in terms of trade and as a religious center. The town was considered a haram, or sacred enclave, even prior to the advent of Islam. The notion of haram is a particularly significant one because of the way in which early Islam reformulated the notion and invested it with new implications.[388] The pre-Islamic sanctuary was associated with an elaborate system of sacred months in which surrounding tribes agreed to cease raiding one another during certain periods in order to make a pilgrimage to the haram. No blood could be shed within its precincts and tribes could meet there to settle outstanding disputes, agree to the terms by which commerce could pass through their territories, and the like. To violate the rules of the sanctuary was to

risk supernatural sanctions and collective retribution from other participants in the haram. Mecca was far from being the only sanctuary in Arabia; the distribution of sanctuaries appears to coincide with major nodes in the trade routes of the period. The Quraysh, Muhammad's own tribal group, appears to have had a special connection with the sanctuary at Mecca and because of this played an important role in the caravan traffic. Caravans as large as 2,500 camels crossed the peninsula by way of Mecca.

In the immediate period before the advent of Islam, each tribal group appears to have had its own deity, although Mecca's was gaining preeminence. The symbols representing the deity of each tribe participating in the Mecca haram were placed in the Ka^cba. The deity particularly associated with Mecca, al-Lat, seems to have been considered vaguely superior to the others. As Mecca consolidated its religious preeminence in the mid-sixth century (about eighty years before Muhammad's claim to prophecy) the major commercial expansion of Mecca occurred.[389]

The control of the Quraysh over Mecca and the surrounding tribal groups was tenuous, as not all tribes were part of the Meccan religious-commercial system. Leading Meccans proposed to the tribes that in return for a pact of security, they would provide a market for the products of oases under their control in Syria and return the capital and profits to participants. Tribes participating in these arrangements were significantly called ahi Allah, "the people of God." A common name among Muhammad's immediate forebears was ^cAbdallah, "servant of God."

As these commercial arrangements became more complex, tension seems to have arisen between "traditional" tribal obligations based upon kinlike egalitarian principles and the consequences of the unequal distribution of commercial wealth. By the early seventh century there were signs of a growing class differentiation with wealth concentrated into a few hands to the exclusion of the poorer clans in Mecca. Certain clans within the Quraysh monopolized the benefits of trade. An oligarchy emerged, with the more powerful clans using mercenaries to enhance their position.

Into this situation came the Prophet Muhammad. He was bom between 570- 580, an orphan from the age of six and from a clan whose importance had diminished. The clan head took care of him but died when Muhammad was eight. From an early age Muhammad undertook caravan journeys and appears to have acted as a mediator in various commercial disputes, suggesting that his clan must have played an important role in the functioning of the haram. He was poor but worked as a camel driver for a rich widow whom he married when he was about twenty-five and she was forty.

For the next fifteen years little is known of Muhammad. The first revelations came to him in 610. At first Muhammad was uncertain of the meaning of these visions but soon became convinced that he was God's messenger. The first revelations came to him in short, rhythmic

lines, called saf^c verse in Arabic. This is a verse form used also by pre-Islamic kahin-s, or soothsayers, and is the form in which supernatural communication was recognized by pre-Islamic Arabs. Arberry's translation of the Quran seeks to convey the rhythm of the original.

By the sun and his morning brightness and by the moon when she follows him, and by the day when it displays him and by the night when it enshrouds him!

(Sura 91 :l-4)[390]

There is a short, staccato pattern with an emphasis on every other syllable in the Arabic original. Given the vocal patterns in Arabic, with six vowels in the language and triliteral roots for most words, it is relatively easy to find rhyming sounds.

From 610 to 613 Muhammad kept the fact of his revelations to the very intimate circle of his wife and close friends. When he finally began to preach, there was initially little opposition to him, but his disciples were not among the rich and powerful. A few were younger men from influential families, others were younger men from weaker families and clans, and others were persons from outside the clan system—persons, in short, with little to gain from the traditional system of alliances.

Muhammad's early preachings can be summed up by four points which served mostly to "warn" men of their ways rather than to challenge existing political and religious patterns.[391] First was an emphasis on God's goodness and power, which was not so much a criticism of paganism as an articulate expression of the emerging predominant role of the Lord of the Ka^cba. The intent of these verses was not always clear. Coincidental with the first strong opposition to Muhammad's teachings, he had the so-called "Satanic" verses revealed to him, in which some of the divinities in the Meccan pantheon were accepted as associates with Allah.[392] Muhammad later retracted these verses, saying that he mistook Satan for the angel Gabriel. A second emphasis of the early revelations is upon a lurid description of Judgment Day and its consequences, evidently to instill in men a notion of responsibility for their acts. Third was the use to which the Quraysh put their wealth, with God encouraging deeds of generosity and works in the service of the community. Finally was an emphasis upon Muhammad as a "wamer." The notion of Muhammad as prophet of God appears to have gained importance only later.

Thus the first preachings were not very revolutionary. The major themes were to reexamine the bases of Mecca's prosperity and to emphasize the brotherhood of all Meccans. In fact, it is possible to argue that initially Muhammad thought of himself as sent to his own tribe (qawm), the Quraysh, and only gradually to have realized his wider mission.

In the nine years that Muhammad preached at Mecca, taunting and harassment of him and his followers increased. Economic warfare ensued between Muhammad’s followers and the Quraysh oligarchy, and Muhammad began appealing for support to the tribes allied with the sanctuary at Mecca. Finally, the leading clans of Quraysh agreed upon a plan to assassinate Muhammad.

Warned of this plot, Muhammad turned to Yathrib (today Medina), a settlement three hundred miles to the north of Mecca. Yathrib was principally an agricultural settlement with its own patterns of internal strife, including tensions between Jewish and non-Jewish clans. Negotiations were conducted with Muhammad, and in 622 an agreement was drawn up specifying his role as an arbiter (hakim).[393] Shortly afterward in the same year, Muhammad took flight (hijra) from Mecca with seventy of his followers and settled in Medina. This is the time from which years are counted in the Muslim lunar calendar.

The fact that there was an explicit agreement concerning Muhammad’s role as arbiter suggests that the members of the Quraysh played similar roles elsewhere in Arabia due to their privileged connection with the sanctuary at Mecca. Muhammad’s claim to prophecy does not figure in the agreement with the Medinans, and very few Medinans appear to have become Muslims at this time.

The transformation in Muhammad’s religious and political authority after his arrival in Medina reveals how his claims to authority were initially understood in the Arabian context. The commonwealth at Medina was called the umma, and each group participating in it was specifically enumerated. Initially in 622, being a member of the umma did not entail accepting Muhammad’s religious claims. As Muhammad was only an arbiter, Jews were among those who adhered to the umma.

There was only a small core of Muhammad’s followers from Mecca ideologically committed to Islam.

The Quraysh in Medina soon realized that Muhammad’s goals included the reconquest of Mecca; Muslims and their allies began to attack the Meccan caravans. In this period Muhammad tolerated temporary alignments with his cause. In fact, he needed all the diplomacy for which he was famous during these early years. Tensions rose high as some Medinans feared risking ah all-out war with Mecca, especially as trade fell off. Moreover, although some Jewish groups were included in the umma, they were hostile to

Muhammad’s claims of prophecy. Eventually they were accused of siding with the enemies of the umma and were fiercely attacked, with the survivors forced to emigrate and settle elsewhere.

For several years Muhammad conducted touch-and-go skirmishes with the Meccans; these gradually had their toll and Meccan prestige began to wane. Mecca’s leaders accepted Muhammad’s terms for his return to the city in 630. He was generous to most of his former opponents except those who in one form or another had taunted his claims to prophecy. Once Muhammad assumed control over the Ka^cba, terms for joining the umma became harder. Tribal delegations poured in from all Arabia. To become a member of the umma, it was now necessary to accept Islam and to pay a tax called the zakat. There had formerly been a tax paid to Meccans by those tribes desiring to participate in trade alliances, so this development was not without precedent.

Trade patterns centering upon Mecca were temporarily restored, but beginning in 630—some sources suggest after the death of Muhammad in 632—rival prophetic movements sprang up elsewhere in Arabia. Muslim accounts of these “false prophets” are understandably hostile, but an analysis of the sources suggests the underlying pattern of cultural assumptions by which Arabs initially interpreted Muhammad’s claim to prophecy.

Four major “false prophets” are known through the Muslims sources, including Musaylima, a derogatory epithet meaning “little Muslim.”[394] He was from an eastern Arabian tribe called the BanI Hamfa. This tribe had control of a major caravan center called al-Hijr, which like Mecca was considered a haram. Caravan routes went from there to Mecca and Medina, Oman, South Arabia, and Persia.[395]

Obviously, there is no reason to believe that the content of Musaylima’s claimed revelations has been preserved intact by Muslim, tradition; he is, in fact, made to appear ridiculous. Of more significance is the fact that his revelations are also in saj^c verse,- a rhetorical style that marks the early revelations of the Quran and the sayings of pre-Islamic soothsayers. As for differences, the sources suggest a clear distinction between Muhammad’s and Musaylima’s conception of authority. Some sources suggest that Musaylima communicated with Muhammad, suggesting that they settle their differences by dividing their respective spheres of authority, with Musaylima of the Baril Harilfa claiming hegemony over eastern Arabia and

Muhammad of Quraysh claiming hegemony elsewhere. Muhammad’s reply was to resist any encroachment upon his authority.

Some accounts clearly reveal the cultural expectation that prophets were aligned with particular social groups. Here, as elsewhere, the Muslim chronicles make for lively reading. One account has a tribesman from eastern Arabia asking Musaylima the source of his prophecy. Musaylima replies that it is ar-Rahman. The tribesman then asks whether ar-Rahman came to Musaylima in light or in shadow, a distinction which makes sense perhaps in terms of Semitic understandings of prophecy in which God's revelations are in the form of light or in visions and, consequently, were distinguished from those of kahin-s who worked in darkness and who were thus associated with the pre-Islamic epoch of ignorance (jahiliya). Musaylima replies that he came in shadows,, to which the tribesman responds: "I testify that you are a liar and that Muhammad is telling the truth. But a liar of [our tribal group] is better for us than a true prophet of [Muhammad's tribal group]." Another version of the same account has the tribesman say that a liar of Musaylima's tribal group is better than a liar of Muhammad's. It should be kept in mind that these accounts derive from Muslim sources, so that such frank recognition of how claims to prophecy actually are understood gives a ring of authenticity to them since they do not always depict the early years of Islam in a reverent way." In any case, prophetic form and the nature of authority appear inextricably linked.

The conception of prophetic authority as exemplified by Muhammad was not limited in scope to the interests of any particular tribal or ethnic group, whereas the notions of authority of his rivals and their supporters appear to have, had such limitations. How Muhammad's claims to authority were popularly understood was a major problem for the early Islamic community. At the Prophet's death there were no clear plans for the succession, and many tribes considered their covenant of submission to Islam to be at an end. When finally Muhammad's successor was chosen, the caliph Abu Bakr (632-634), his authority was far from carefully defined. He continued to be a merchant and even had to milk his neighbor's sheep until finally he was allowed money from the communal purse. Fortunately, the Islamic community possessed tacticians capable of using an inferior military force slowly to unify the tribes of the peninsula and bring them back to the Islamic fold.

Perhaps because sociological approaches to the study of religion are often misunderstood, particularly by those committed to the religious tradition which is the subject of consideration, I should state my own commitment to making sense

[9] Cited in Tabari (d. 923), History of Prophets and Kings (in Arabic), ed. Muhammad Abu 1-Fadl Ibrahim (Cairo: Dar al-Ma^carif, 1962), p. 1937. (My translation.) After a series of military reverses, another source records the following dry humor of a tribal ally of the Muslims: "Muhammad used to promise that we should eat the treasures of Chosroes and Caesar and today not one of us can feel safe in going to the privy!" Cited in al-Waqidi (d. 822), The Book of Campaigns (in Arabic), Vol. 2, ed. Marsden Jones (London: Oxford University Press, 1966), p. 675. (My bowdlerized translation.) of Islam in seventh-century Arabia. Tor me, a study of Muhammad's political strategies and marriage alliances, the apparent development both of his prophetic message

and how it was understood in seventh-century Arabia, and the growing richness and complexity of the Islamic tradition are made more meaningful when they are viewed with all the critical resources that anthropology and social history allow. The originality and strength of Muhammad's prophetic message become all the more vivid as one begins to see patterns in the economy, polity, and ideology of the time in which he lived, and how the popular understandings of man and the divine and the implications for human society were reworked and put into practice.

Thus far the economic and political transformations of seventh-century Arabia and the period immediately preceding it have been discussed, although the episode of the "false prophets" has suggested the relation between conceptions of man and the divine and the role of prophecy and the practical importance of these issues. One of the best sources for the nature of pre-Islamic beliefs is the Quran itself, for many of its revelations record the skepticism with which some of Muhammad's preachings were received and the nature of earlier understandings of the relation between man and the divine. There are other sources as well, but the Quran itself is the best record of the ideological transformations implicit in Muhammad's prophetic message. Toshihiko Izutsu, a Japanese scholar trained in anthropological linguistics, has written seminal books on the relation of Muhammad's prophetic message to his sociohistorical context.[396] Despite the forbidding titles of his two studies and the forbidding (but necessary) use of citations from the Arabic original alongside the translated verses, his studies are the best available which show how key Quranic concepts are related to one another and how the message of the Quran brought about fundamental shifts in the meaning of these concepts. To take only one key concept, that of God, Izutsu indicates from Quranic texts how Allah was comprehended in pre-Islamic times. In different verses, Allah is referred to as creator of the world, as giver of rain and life, as the supernatural being who presides over solemn oaths at the Ka^cba, as a God above all other gods, and as "Lord of the Ka^cba." The Quran makes clear the pre-Islamic status of these beliefs.

If you ask them [that is, the pagan Arabs] "Who has created the heavens and the earth, and has imposed law and order upon the sun and the moon?" They will surely answer, "Allah!" (Sura 39, v. 61)

Other verses can be cited which just as directly confirm the complex of beliefs, not necessarily fully systematic, of pre-Islamic Arabs. An indication of the lack of consistency is in the verses which suggest that Allah is sometimes thought of as the only God. Thus in one Quranic context pre-Islamic Arabs are made to call upon Allah alone in times of imminent danger such as shipwrecks.

But when He brings them safe to land, behold, they begin to ascribe partners. (Sura 39, v. 65)[397]

Thus the inconsistency in how Allah’s status was regarded is made apparent. Similarly, other verses document the notion that Allah was the God particularly associated with the Ka^cba, a guarantor of two major annual caravans and of the sanctity of the haram. Even Izutsu’s analysis of how the concept of Allah was reformulated cannot be taken by itself but must be considered in light of the entire complex of assumptions made by pre-Islamic Arabs and later by Muslims about a range of key topics: notions of the person, of relations between man and man, and of relations between man and God. The Islamic vision of religion and society continues to be capable of the effective reformulation of what are regarded to be eternal truths.

* Part IV: The Shape of Change

** 10. Cities in Their Place

Cities aren’t isolates, but wide-ranging flows of people, authority systems, cultural symbols, capital innovations.[398]

*** Issues

Anthropologists, social historians, sociologists, and a rapidly disappearing breed of area specialists called “Orientalists” have written substantially on cities in the Middle East. Until recently these discussions have been hampered by two factors. One has been a lack of communication between disciplines. Social scientists, on the one hand, knew their social theory but were less familiar with materials specifically dealing with the Middle East. For their part, Orientalists tended to be so wrapped up in their immediate data that their descriptions rarely posed broader sociological questions. Secondly, scholars concerned with the classical question of the nature of the Islamic city as an ideal type by and large did not seek to articulate their analysis with those scholars concerned with contemporary Middle Eastern cities, the consequences of major economic changes (which of course were not confined only to the last two centuries), migration, and population growth.

Within the last two decades, scholars have sought to join historical with contemporary domains of interest and the insights of area scholarship with broader disciplinary trends in sociology and social history.[399] This chapter will assess how the main contours of past and present urban life have been interpreted by anthropologists and scholars in related disciplines. Also it will suggest some of the major social and cultural consequences of the rapid transformation of the urban landscape in the last four or five decades. If there has been a “great divide” until recently between scholars interested in “premodem” Middle Eastern cities and contemporary ones, this is in part because of the lack of adequate social theory to deal with processes and change in values and institutions. Even if such theory is not yet fully developed, anthropologists are now much more aware of the

necessity of describing the direction of change and of making full use of social historical materials, as Brown’s People of Sale and similar studies demonstrate.

One presentational caveat concerning this chapter must be kept in mind. It is short. The reason for this is quite straightforward if a distinction is made between the anthropology of cities and anthropology in cities. Many studies which are categorized as urban anthropology merely conduct studies of significant anthropological topics in urban milieu. Many such studies have been referred to throughout this book and are reintroduced here only briefly and usually by reference to discussions in earlier chapters. The anthropology of cities, or of urban forms, is more limited in scope. Here is where the integration of studies concerning earlier urban forms and those of the present has been particularly beneficial. This chapter is particularly concerned with the anthropology of cities. Of course, the two concerns with cities are not fully separable. The social organization of work in cities and the intensity of their exposure to economic and political currents from elsewhere are such that processes of class formation often appear more pronounced in cities. Hence the topic of class formation and how anthropologists have evaluated it is introduced in this chapter, but discussion of it continues in the wider context of Chapter 11.

In considering cities past and present and their implications for culture and society in general, the magnitude of the growth of the urban population of the

Middle East in recent years is an important consideration. As with the rest of the Third World, urban growth in the region has occurred at an accelerated pace. In 1900 less than 10 percent of the inhabitants of the Middle East were urban. By mid-century, 25 percent were urban and the projections for 1985 are for 43 percent of North Africa and 47 percent of Southwest Asia’s populations to be urban. Moreover, urbanization tends to be overconcentrated in a few centers.[400] Thus in Morocco, which despite an accelerated urbanization remains over 60 percent rural, much of the urban population is concentrated in a narrow strip of land extending 150 km north from Casablanca and 50 km inland.[401] Statistics for Casablanca and Cairo dramatize the rapidity of this growth. At the turn of the century, Casablanca had a population of 20,000. By 1936 it had grown to 260,000, one-third of which was European: By 1963 it had over a million inhabitants despite the fact that the European population had dropped to less than 10 percent and continues to decline.

o n fl

FIGURE 10-3 The distribution of cities today suggests an overconcentration in a few major centers. (Not all smaller cities are shown on this map.)

In the late 1970s the city's population was nearing the two million mark.[5] Cairo in 1806 had a population of about 250,000. It had 800,000 at the turn of the century, 3.5 million by 1960, and over 5 million in 1970. Since the absorption of refugees from the Suez Canal zone after the June 1967 war and a continuing influx of immigrants from other areas, it will probably have 8 million inhabitants by 1980.[6] Elsewhere the strength of urban growth is equally pronounced, with over half of Lebanon's population concentrated in the capital area and less than onefourth in villages; Tunis contains over half of the country's population, and the Tel Aviv district has over half of Israel's. Similar overconcentration occurs elsewhere and shows no sign of reversal.[7] The current pace of urban growth is particularly critical. Clifford Geertz, after due cautions concerning comparisons between different historical periods, observes that the period of 1800-1850 is considered one of rapid urban growth in the West, with seven million additional urban inhabitants. In the 1950-1970 period it is safe to estimate that the urban population of the Middle East has nearly doubled and involves a much larger number of persons. Moreover, the urban "leap" in Western Europe and the United States took place in the context of rapid economic development and industrialization. This has not been the case for much of the Middle East. "If seven million over half a century convulsed European social structure," Geertz suggests, the more rapid growth in a shorter period elsewhere "can be expected to raise problems of adjustment which [will] make those of nineteenth century Europe seem like the merest of growing pains."[8]

*** The "Islamic" City

Any assessment of "growing pains" or adjustment necessitates an understanding of the social history and patterns of growth of Middle Eastern urban forms. Until recently, most scholars have dealt with the issue in terms of the "Islamic" city, a notion which presumes that Islam prescribes particular urban forms. Only in recent years have advances been made

in how this problem is conceived. Social historians and anthropologists concerned with urbanism in the Middle East were handicapped by the form in which the German sociologist Max Weber posed his famous question of comparative urbanism. Why, Weber asked, did a distinct form of urban organization, the commune, arise only in medieval Europe and not elsewhere? Weber discerned a distinctly urban, corporate form of social organization in European towns which distinguished them from the larger society of which they

The analogy and citation are derived from Clifford Geertz, “The Social History of a Moroccan Town,” Princeton (March 1971), mimeo. (Used by permission of the author.) formed a part, but he found no equivalent in the Orient.[402] His discussion of cities elsewhere merely served as a backdrop for what he regarded as the uniqueness of cities in the West. Despite the fact that many traditional cities in the Muslim world were often set apart from their surroundings by towering walls (as were many cities in medieval Europe), in general they possessed little autonomy from the state and no distinctive formal organization. Led, or misled, by Weber’s formulation of comparative urbanism and similar ones posed by other scholars, some Orientalists sought the equivalent to European communes in the Muslim world but predictably had little success. For instance, the French Orientalist Louis Massignon argued that the so-called guilds of merchants and craftsmen in the Muslim Middle East served much the same purpose as the communes but never produced evidence to support his assertion. As one critic recently commented, despite Massignon’s stature as a scholar his work on urban forms abused evidence and constituted no more than a “tissue of fallacies”—strong language in the relatively genteel work of Orientalist scholarship.[403] Other scholars tended to get bogged down in descriptiv- ism, enumerating the features that appeared to characterize particular Islamic cities or “the” Islamic city as an ideal type. Features such as the presence of mosques, marketplaces, public baths, and so on were suggested as essential characteristics of such cities, but exceptions can be found to each of these enumerations. For example, virtually every rural local community in Morocco has a mosque, although not of course as impressive as those of the great urban centers, and many markets in Morocco are unrelated to cities. An enumeration of such features cannot in itself distinguish towns from villages. Other scholars have represented the characteristics of towns as enumerated by Muslim theologians.[404] As the morphology and functioning of cities throughout the Islamic world has become better known, the inadequacies of stereotypic notions of Islamic cites have become increasingly apparent. For instance, Bonine has argued that the gridlike form of medieval Iranian cities is

derived primarily from the exigencies of irrigation systems and is not an outgrowth of specifically Islamic influences. Lapidus has reminded scholars that Muslims conquerors more often took over cities from earlier rulers rather than build them anew, and the balance between urban and nonurban populations was not significantly changed by the Islamic conquests in themselves despite the fact that many Orientalists have characterized Islam misleadingly as an “urban” religion.[405]

Despite the shortcomings of earlier studies, a number of meticulously detailed descriptive monographs concerning “representative” Islamic cities emerged. Thus Le Tourneau’s massive work on Fez made the assumption that the city’s spatial layout and the economic, political, and social institutions until just prior to French conquest in 1912 were essentially the same as they were for half a millennium.[406] This presumed stasis of urban development encouraged many scholars to think of Islamic cities as analogous to those of Europe in the Middle Ages.

The atemporal assumptions and misplaced analogies of the French tradition concerning the nature of Islamic cities did not prevent the resulting descriptive ethnographies and historical studies from becoming an irreplaceable primary documentation upon which later scholars now rely.

FIGURE 10-4 Traditional South Arabian architecture. For defensive purposes, there are no windows on lower stories. (From Freya Stark, Seen in the Hadhramaut [London: John Murray, Publishers, Ltd., 1939], p. 19. Courtesy of the author and the publisher.)

One of the first breakthroughs in the scholarly impasse of how Islamic cities were studied was the appearance in 1967 of Lapidus’s Muslim Cities.[407] Essentially, Lapidus changed the form of sociological question asked. Rather than search for social forms that were unique to cities, as suggested by the approach of Weber, Lapidus instead sought to delineate the social forms which were in cities and which allowed for the orderly conduct of social life. His emphasis was upon such fundamental social institutions as families and quarters, religious organization, and how the administrative machinery of the state effectively worked. For Lapidus, “Muslim cities are cities by virtue of social processes which are not peculiar to any given culture, but they are Muslim by virtue of the predominance of subcommunities which embodied Muslim beliefs and a Muslim way of life.” It is the interaction of the various subcommunities and of the various elites which created the urban community and achieved a “sufficiently good order.”[408] There were informal, but crucial, cross-cutting patterns of kinship, religion, politics, and economics. He focuses upon the nature and the comparison of social structures rather than upon cities themselves, firmly breaking with Weber’s approach to discussing urban forms.

Lapidus’s analysis is in general congruent with the recurrent argument of this book that many of the most significant patterns of constancy and order in Middle Eastern cultures are to be found in what scholars earlier dismissed as “informal” social groupings. There are shared cultural perceptions of how persons relate to each other which do not necessarily manifest themselves in the form of organized groups or classes.

One of the ways in which these underlying cultural notions of the social order ; are manifested is in their influence upon spatial perceptions and the use of space.[409] This relationship has been a long-standing concern in Middle Eastern studies, but the form in which the issue is discussed has shifted substantially in recent years. For instance, an earlier generation of colonial ethnographers considered the confusing—from a European perspective—maze of narrow, winding streets and blind alleys of traditional North African cities (madiha-s)to be a direct spatial projection of the “alogical” disorder of the “indigenous mentality,” a notion which unfortunately j has not entirely disappeared from the scholarly corpus.[410] There is no generalizing principle which allows a person to get from one place to another on the basis of abstract spatial criteria. In essence, one learns how to get from one point to another

FIGURE 10-5 The winding streets and blind alleys of traditional North African cities constituted a puzzle for colonial ethnographers.

(Courtesy of the author.)

by having gone there before. Even in smaller towns in North Africa, it is not uncommon for persons from one part of town to get lost in unfamiliar sections, and residents will routinely ask “strangers” from elsewhere in their town what they are doing there. Moreover, residential quarters and houses within them are not now and have not been in the past clearly distinguished in any exterior way on the basis of wealth or other criteria, although in southwest Asian cities such as Antioch and Baghdad sectarian groups generally cluster in separate urban quarters.[18] With the exception of Jewish quarters (mallah-s) in many towns, such separation is generally lacking in North Africa.

Four discernible patterns of spatial order can be found in most precolonial Middle Eastern cities: the relation of towns to the state, the market (suq) or economic complex, the relation of religious institutions to the town, and the'organization of residential and domestic space.[412] These various principles of order overlap. The presence of the central power is often represented by a separate, fortified quarter either within the larger cities or alongside it. In North Africa such a compound is called a qasba, or fortress. Soldiers or government representatives would be settled in this compound and usually were distinguishable from other townsfolk. A second pattern of order is the complex of economic activity, the traditional patterns of which have been extensively analyzed by Clifford Geertz.[413] There is a

FIGURE 10-6 Major commercial streets are often partially separated from residential ones. Covered suq, Tetouan, Morocco. (Courtesy of the author.)

tendency for commercial and craft activities to be separated from places of residence, so that with the exception of small shops within residential quarters, most mercantile activities and the circulation of people, carts, and animals associated with them are removed from the semiprivate space of residential quarters. There is also a tendency for commercial and artisanal activities to be hierarchically ordered, with the more prestipous closest to the principal mosque and others located on the principal arteries.

The religious institutions cross-cut many of the other notions of order. In larger urban centers such as Tunis and Fez, the principal mosque is the place for the Friday sermon and the rituals associated with major feast days. In the past, it also served as a place of learning and frequently was the focal point for public protest in times of civil unrest. This symbolic centrality of the mosque was frequently replicated by its spatial centrality. In Tunis, the mosque is accessible by major arteries leading to the principal gates of the madina, facilitating access to it from all residential quarters. As earlier discussed, an additional tie between religious institutions and commercial activities is provided by the pious endowments (waqf; habus), which rent a number of shops in the commercial sector at below market values.[414] Finally, there are the maraboutic shrines associated with each city or town which even today serve occasionally as focal points of communal activities.

A final principle of order is the division of traditional matttna-s into residential quarters, with the households of each quarter claiming multiple personal ties

and common interests based on varying combinations of kinship, common origin, ethnicity, patronage and clientship, participation in factional alliances, and spatial propinquity itself. In a small Moroccan town in which I conducted research between 1968-1970, residents divided their town into anything from thirty to forty-three quarters. The fact that there is such a discrepancy in how townsmen evaluate space even in such a small setting indicates that space is not conceived entirely in a fixed way or primarily by abstract physical features. How

quarters were evaluated depended on what people knew of the social history of their town, which varied with generation and social position, and formative experiences shared with other persons in the community. The demarcation of quarters cannot always be discerned by physical signs. Many are clustered around impasses, but this is not always the case. For one thing, the social boundaries of many quarters are subject to modification; for another, not all houses are necessarily thought to be part of quarters. Only those clusters of households evaluated as sustaining a particular quality of life are known as quarters.

As previously indicated in Chapter 6, that quality of life is defined by the extension in contiguous physical space of the notion of “closeness” (qaraba); component households in a quarter assume that they share a certain moral unity so that in some respects social space in their quarter can be regarded as an extension of their own households. This closeness is symbolized in a number of ways: the exchange of visits on feast days, assistance and participation in the activities connected with births, circumcisions, weddings and funerals of component households, and the like. The heads of household of a quarter share certain minimal collective responsibilities. They often construct and maintain a mosque and hire a Quranic teacher for it. Because of the multiple ties which link the residents of a quarter, respectable women who never venture to the main market can circulate discreetly within their quarter, since the residents all assume a closeness to each other. In Chapter 6, I provided an example of the “formation” of a new quarter due to long-term shifts in social status as perceived by residents of a town. Quarters also decline and lose their cohesiveness. Thus certain quarters took shape in the 1920s and 1930s with the rapid ascendancy of certain rural Qa’id-s. Another quarter which emerged in this period was named after a family which had as its “founding” ancestor a merchant who traded in the Berber highlands prior to the arrival of the French in 1912. The descendants of this merchant became prosperous soon after the advent of the colonial era and purchased land on which the French built a major extension of the town in the 1930s. In the nationalist fervor that began in the 1930s and continued for some years after independence, two of the merchant’s sons (also merchants themselves) became the leaders of rival political parties. Despite their rivalries, both lived in nearly adjoining houses, and other residents of the quarter continue to stress a variety of ties with the brothers’ family. As long as a quarter had men of prominence or “word” capable of acting as their leaders, some sort of claim of common descent or origin, and the ability at least in some contexts to act collectively, it constituted a feature in people’s shared conceptual image of the town. As the distribution of power, authority, and prestige shifts, so does the conception of space. Thus despite the apparent “disarray” of such spatial conceptions to outsiders, they follow an articulate cultural logic. Similar Conceptions of space appear to prevail elsewhere in the Middle East. To use Kevin Lynch’s term, the imageability of residential space in the Middle East is not principally in terms of physical landmarks but in shared conceptions of the social order. The cultural bases of these conceptions can be abstractly delineated, but a particular knowledge is needed for orientation in the social space of each town. Gulick’s study of Tripoli, Lebanon, clearly indicates that the notion of imageability is more useful when it encompasses not only visual form (which is Lynch’s emphasis), but also those which are socioculturally significant in both “modem” and traditional settings.[22] Studies such as Gulick’s suggest some of the significant continuities between the social and spatial order discerned for “Islamic” cities and contemporary urban forms,

*** Colonial Cities and Their Legacy

Colonial principles of spatial order are particular instances of the spatial projection of dominant cultural values or, to be more precise, the values of the dominating political power. The colonial cities of French North Africa, especially in Morocco, i provide particularly clear examples of the basic principles of colonial urban plan- j ning. If India was the colony upon which Great Britain lavished the most elaborate | attention, then Morocco was its equivalent for the French. Colonial cities were not just the juxtaposition of the urban forms of the dominating power and the dominated. They were new creations with specific and lasting social consequences.[23] In j cities such as Casablanca, commercial and economic interests were so powerful and growth so rapid that colonial authorities were unable to plan effectively for rational growth and development. Elsewhere, however, the French developed almost Cartesian plans which clearly articulated the legitimizing ideology of colonial domination. One of the myths of legitimacy used by the French in Tunisia and Morocco was that they were not a colonial power. “Native” regimes were maintained intact in both countries, and these regimes were “aided” by the authorities ! of the Protectorate who acted in the name of the Muslim rulers. Technically the ; French role was one of preserving native institutions. The consequence for urban, planning—and in the case of Morocco every town had a developmental plan by the 1930s—was a basic dualism in urban growth. In nearly every case, the “traditional”, [22] Kevin Lynch, The Image of the City (Cambridge: The M.I.T. Press, I960); John Gulick, “Images of an Arab City,” Journal of the American Institute of Planners, 29, no. 3 ■ (August 1963), 196-97. See also Gulick’s Tripoli: A Modem Arab City, Harvard Middle Eastern Monographs, 12 (Cambridge: Harvard University Press, 1967).

[23] See Anthony D. King, Colonial Urban Development: Culture, Social Power and Environment (London: Routledge & Kegan Paul, 1976).

madma was preserved more or less intact, while a “new” town, meant primarily, but not exclusively, for Europeans, grew up alongside it. In some cases, two “new” towns were created: one for “evolved” natives, another for Europeans. The overall shape of the town of Tunis (Fig. 10-7) suggests how this philosophy was spatially projected. As some Tunisians comment, the overall street plan takes the form of a cross being rammed into the madma, making the colonial imagery even more suggestive. One plan for Tunis, elaborated during the Vichy regime but never carried out, took the notion of colonial planning one step further. The “modem” part of Tunis was divided along one main axis between Christians and Muslims (with a few “neutral” places in between) and along the other axis between bourgeoisie and workers, thus using the principles of religion and class for the spatial ordering of society.[415]

The initial colonial planning for Morocco from the inception of the Protectorate in 1912 until the 1930s was highly coherent and based upon three principles.[416]

FIGURE 10-7 "Tunis showing juxtaposition of old and new city, and Bourguiba Avenue as battering ram against old city." (From Brown, ed., From Madina to Metropolis, p. 29.

Courtesy of L. Carl Brown and The Darwin Press, Inc.)

The first was that madinas were to be separated from European quarters. This division corresponded to what the French saw as the fundamentally “different” mentalities of the Muslims and Europeans. Thus it was argued that most “traditional” Moroccans preferred to be insulated from the outside world so that the vitality of traditional life could be preserved. Although an effort was made to provide the madma-s with improved sewers, water systems, and electricity, the seeds were planted for many madma-s to deteriorate into historic slums, dying a slow death of benign neglect. There were exceptions for cities such as Sale and Tetouan, where many of the traditional bourgeoisie maintained their houses for reasons of prestige, but the overall trend, especially after the economic dislocations of the Second World War, was to abandon such housing to impoverished rural immigrants.

A second principle was for town planning to protect the cultural heritage. Colonial planners enforced strict regulations designed to protect the town as an overall monument, a notion which began to be applied internationally in most countries only by the 1960s. As Dethier suggests, whatever the intentions of the planners, Moroccans often interpreted the decision to retain walls around the madma as a security measure. In fact, some of the older “native” housing developments, one in the phosphate mining center Khouribga and the other in Casablanca, had walls with guards posted at the gates for just such a purpose, although the security was ostensibly for the inhabitants of the developments and not against them.

The final hotion was that of constructing the “new” cities according to the most up-to-date principles of planning. The result for many Moroccan towns was the provision of parks and green spaces (admittedly often serving as a buffer between European and Moroccan quarters) and zoning regulations which except for Casablanca adequately managed to control the direction of growth. The state also purchased tracts of land which were then sold under strict controls to prevent speculation. Public buildings were designed and situated so as to contribute to the overall symmetry of towns, and town planners took special care to use distinctive features of local topography. With the exception of the provision of “evolved” native quarters until the late 1940s, such planning was primarily for the benefit of Europeans, as if the political and economic transformations of the colonial regime could leave the indigenous population undisturbed. And in the “evolved” settlements, the proviso that construction had to begin immediately and according to strict (and expensive) specifications ensured that only wealthier Moroccans could take advantage of them. Despite the efforts of colonial authorities to Emit emigration from rural areas, so-called “clandestine”

housing emerged, especially in the form of the shantytowns, or bidonvilles, whose inhabitants were primarily emigrants from rural areas. Such “temporary” housing has become a permanent feature of most large Middle Eastern cities, with local variations such as Cairo’s “City of the Dead,” where families have taken above-ground tombs for housing. Studies that have been conducted on the value of land in shantytowns indicate that unscrupulous realtors can realize a larger profit from collecting rents from such lands than in building more expensive housing. Because of the illegal nature

FIGURE 10-8 Such "temporary” housing as this has become a permanent feature of many Middle Eastern cities. Bidon- ville Bni Msik, Casablanca, 1968. (Photograph by D. PaPini. Daniel Noin, La Population rurale du Maroc [Paris: Presses Universitaires de France, 1970], plate 48. Used by permission of the publisher.)

of such housing, when the land is needed for other purposes the shacks on it technically can be cleared, although actual exercise of such rights involves political risks. Although planners often have thought of shantytowns as a passing phenomenon, the attempts made after the end of the Second World War by the Protectorate government and by Morocco’s independent government have never effectively managed to stem their growth. Analogous developments occurred throughout the Middle East; in Turkey fully 13 percent of the urban population live in shantytowns (gecekondu-s), and in many towns of the Middle East the figure may be significantly higher.[417]

The planning policies of independent regimes throughout the Middle East unsurprisingly reflect the ideology of dominant groups and the legacy of colonial assumptions concerning urban life. Ellen Micaud has produced what amounts to an ethnography of successive urban plans for post-independence Tunis. Immediately after Independence in 1956, the Tunisian elite viewed the madina as an obstacle to be surmounted so that the country could have “a capital worthy of the active modernizing image being fashioned on all fronts.”[418] After Independence the exodus of all who could afford to leave the madma for other housing rapidly

I j j 3 accelerated, thus leaving the madina to rural immigrants and others who had no

1 active say in its future. Commercial and administrative activities had increasingly

shifted away from the madma during the colonial period. Finally, the nationalization of pious endowments in 1957 radically changed the economic and legal structure of the madma. At best, some visionary plans called for the neglect of the

1 madma as a sort of natural obstacle which planners sought to avoid. This stage of

i post-independence planning can in some ways be considered an implicit acceptance

j of the colonial devaluation of the madina, in the sense that it was associated with

s an inferior status and an unvalued past. In the late 1960s with the burgeoning of the

j tourist industry, there was a shift to regarding the madma as part of the natural

j heritage, and various plans, some of which were the subject of international com-

j petitions, were evolved in an effort to regard it as part of the national tourist

'] business. A final, more realistic phase was begun in 1973 with more modest projects

1 but ones designed to encourage the maintenance of housing within the madma

’ (through legislation to facilitate owner-occupied dwellings) and to provide subsidies

1 for various craft and artisanal activities. Planners began to realize that it was not

i possible to allow any further deterioration of the madma, given the worsening hous

ing crisis throughout the capital region. Only after two decades of Independence has j it been possible to regard the madma as an integral and enduring part of Tunisia’s 3 heritage and living present.

*** Cities Now

The study of cities necessarily involves evaluation of the approaches used by a number of disciplines. Fuad I. Khuri, whose studies on the urbanization of the i greater Beirut region have been discussed in earlier contexts, sees Middle Eastern

i urban studies as falling into three major categories.[28] First is what he calls the

| survey approach: the compilation of demographic data which indicate something

3 about the age distribution of urban residents as opposed to those of the country,

j levels of consumption, size and density of urban areas, and other such indices. In

j the main, he states, such compilations of statistics are part of international efforts

1 to assess the extent of urbanization and the administrative problems associated with

] it. He writes that although the theoretical contribution of such studies is minimal

! and their interpretation is often relatively haphazard, such statistics can often high

light problems which require explanation.[29]

I A second major approach is the study of particular problems—religious beliefs

and practice, child rearing, educational aspirations, and the like—in terms of urban- rural contrasts, sectarian differences, and socioeconomic backgrounds. According to Khuri, the difficulty with most such studies is that they accept uncritically the

3 [28] Fuad I. Khuri, From Village to Suburb: Order and Change in Greater Beirut (Chicago

j and London: University of Chicago Press, 1975), pp. 1-15.

j [29] Ibid., p. 2.

validity of the categories used, such as rural and urban. Such studies often do not provide a comprehensive theory of the nature of urban life with which the various characteristics attributed to urban and rural communities or to various socioeconomic classes can be systematically linked. He provides as a key example Janet Abu-Lughod's major study of Cairo in which she contrasts the "modem urban" style of life of Cairo as opposed to the "rural." Khuri argues that Abu-Lughod's contrast can be accounted for just as well in both Egyptian and Lebanese contexts by whether people are rich or poor, so that the presumption that the differences are urban and rural is misleading. Rural dwellers can be separated from urban ones on the basis of a set of distinguishing factors or variables, but Khuri questions whether these define the character of either society unless the interconnectedness among the itemized variables is shown.[419] He suggests that other studies (with the exception of Abu-Lughod's meticulous analysis of the demography, socioeconomic characteristics, and social history of every major district of Cairo) have ignored the impressive changes that have modified the "social character" of Middle Eastern cities since the 1930s, and have written, instead, of villages or cities as if they were constants. Khuri sees his own "community" study of two contrasting Beirut suburbs as a third approach which does not assume such constancy. For Khuri, suburbs are communities that are still finding their form and coming into being. His approach to their analysis is to deal "with a wide range of structures, organizations, institutions, customs, socioeconomic differentiation, and political action." Khuri's self-description of his methodological approach is unexceptionable, despite the quality of his analysis, because he downplays his sustained attention to the social history of how these communities came into being. This provides the necessary background against which notions of ethnic and sectarian identity can be evaluated.

In contrast to the Western pattern of specialized suburban communities, many of which serve as dormitories for nearby business and industrial districts, Khuri indicates that there is a tendency for Lebanese suburban communities to be economically independent and self-contained. He concludes that in the communities studied, "Class is the least important

instrument of organization. Neither neighborhoods, quarters, or suburbs, nor voluntary associations, societies, clubs, or political constellations are based on class affinities."[420] It is visible in political roles and apartment styles, but there is no American-style association between class and area of residence.

Unless Khuri's argument is taken as limited to the relation of class to residential area, his conclusion is markedly controversial in terms of Lebanon, where other analysts have asserted that class factors are decisive and underlie other characteristics such as sectarian loyalties. In fact, Khuri's argument as to the association of class and residential area deserves careful attention because elsewhere in the Middle East spatial differentiation based upon wealth, migrant status, and other key variables has become increasingly common and suggests the increasing importance of class, occupation, and wealth as organizing factors of the social order.[421] In many of the oil-wealthy Gulf states, which have experienced massive building growth since the 1960s, it has been common to construct large blocks of housing designed for particular occupational categories, with regions of villas reserved for engineers, merchants, and other persons of high status, and three-storied walk-up apartment buildings for those of more limited income groups. Such a pattern is also common in older cities. Baghdad has large sectors marked off for particular types of housing—for military officers, civil service employees, and those of particular industries such as oil, railroads, utilities, and banks.[422] Similar patterns prevail throughout North Africa and elsewhere in the Middle East.

Another sort of spatial order is provided by the settlement of migrants in cities, a phenomenon which accelerated at the end of the Second World War and

FIGURE 10-9 Modern construction in Oman dates almost entirely from the post-1970 era. (Courtesy of the author.)

has continued unabated ever since. Abu-Lughod has presented a portrait of a "typical" migrant to Cairo in the late 1950s. He was a young male, who spent his first days in the city with a relative or friend from his village of origin. When he found more permanent lodging, it usually was in a neighborhood or subsection of the town occupied by other migrants from the same region. A similar pattern prevails today. Such migrants often formed benevolent associations to look after some of their common interests. To help them to adjust to city life, migrants have a network of primary personal associations "far beyond" what is deemed possible in the West to help them adjust, enmeshing "not hundreds but thousands of individuals."[423] A similar pattern of settlement and the use of personal networks to adapt to new situations prevails elsewhere in the Middle East.[424]

Not all recent settlements of migrants consist of shantytowns; often individuals move out of them when their financial circumstances allow. For modest civil servants, employees of factories, bus conductors, and persons of similar occupation, this means renting or buying a

house in a neighborhood such as Casablanca’s ^cAyn Shuq (Ain Chok). This is a neighborhood about half an hour to the east from the center of town by municipal bus, named after one of the first postWorld War II housing developments constructed for Moroccans by the French. It is close to what in 1979 was still the periphery of a rapidly expanding Casablanca. The original development consists of carefully laid out rectangular streets; only the principal streets can be used by automobiles. Shops, a bath, and a mosque are located along these main internal streets; impasses lead off them, and the whole complex is accessible from the outside by only a few streets, so that the overall spatial principles of a traditional madina are replicated. The visual impression of its inhabitants suggests that they are older, retired persons or elderly soldiers, including many of those initially granted rights to housing in the development. Because rents for government developments are lower than commercial ones, such rights are jealously protected. In fact, with Morocco’s current housing crisis, rights to such housing are often seconded to others at higher prices.

The original project is now dwarfed by the adjoining housing which is privately constructed. Principal shops are located along a major highway and boulevard which determine the limits of the quarter. These are almost the only streets which have trees along them. The remaining sides of the quarter are bounded by empty lands owned in part by the government. Large primary and secondary schools and an orphanage adjoin the quarter. Every morning thousands of schoolchildren cross paths through the garbage-strewn empty spaces to these various schools, some ,for boys and girls together, others with separate education. Most of these schools are of recent construction, in a desperate effort to keep up with population growth in which over half the population is under the age of eighteen. Because schools can be a symbol of progress and improvement, it is important to indicate how they are experienced by the children of the quarter. So much time is spent by the under-eighteen population in school or in school-related defined activities that the relation of the school to other aspects of society is decidedly crucial. The school buildings are modestly but adequately designed, with a high wall cutting them off from the outside, adequate lighting on sunny days, and small internal courtyards. In the late 1970s there was no problem of ventilation as virtually every window was broken during a series of student demonstrations against the growing inadequacies of an educational system unable to cope with rapid expansion. Even the fewer than 10 percent of the entering school students who eventually obtain diplomas cannot be assured of gainful employment. School furniture is broken or defective; blackboards and books are few. For the teachers who take an interest in them, students show a marked enthusiasm. For the others, especially when official visitors are present to evaluate teaching performance, students deliberately show inattention or indifference. More than twenty years after Morocco’s independence, many of the teachers in the secondary cycle continue to be foreigners, some from France and other European countries, including Eastern Europe, and a few from Eastern Arab countries. Almost none of the

FIGURE 10-10 Fewer than 10 percent of entering secondary school students eventually obtain diplomas. Secondary school in ^cAyn Shuq, Casablanca. (Courtesy of the author.)

European teachers makes any effort to learn Arabic, to converse with their Moroccan colleagues outside of formal meetings, or to meet with their students outside of classroom situations. The moment school is over, they leave for other parts of Casablanca, much like many teachers in America’s inner cities. Only the younger Moroccan teachers live in the quarter itself, unless they have a family or relatives elsewhere in Casablanca. Almost all of these teachers meet informally with their students to discuss their progress and offer them advice.

As for the quarter itself, few of its streets are paved. The streets are laid out in rectangular fashion and houses are provided with sewers, electricity, and water, all indicating the essentials of urban facilities even if no other amenities are provided. Only a few of the larger stores on the periphery of the quarter are well stocked. Most stores sell in small quantities, carry only basic commodities and sell at higher prices to their clients in exchange for extended credit. Several garages have been converted into mosques without minarets. Houses are mostly two-storied, but the houses of the entire quarter, with their gaudy facades of pink, light blue, green, yellow, and orange indicate that most inhabitants gradually constructed their own properties. The interiors of many houses show that originally they were singlestoried with open courtyards. As owners acquire the funds, they add on, a room or a story at a time. Many owners rent part of their houses to other families or to single civil servants such as teachers in order to pay for additional construction. Casablanca has rent control laws as do many other cities in the Middle East, but in practice they work effectively only for long-term tenants.

There are virtually no factories near the quarter, and many inhabitants are underemployed or support numbers of persons not in the labor force. Outside of school hours, the streets are crowded with children playing; radios blare throughout the daytime, and in the early evening they are joined by the noise of television sets. There are some cars parked on the streets and a much larger number of scooters, but most residents depend upon public buses. Bus rides to elsewhere in the city are long and often uncomfortable, but the lower rent and cost of housing in a peripheral, popular quarter outweigh such inconvenience.

Most of the quarter’s residents are by origin from elsewhere in Morocco, but there are no evident patterns of settlement. Neighbors are civil and cooperate with each other but usually at a fairly minimum level. The structure of ownership and the feeling of many residents that they belong to the quarter only until they find more substantial housing militates against more permanent bonds. Teenagers and young adults—both men and women in the case of Casablanca—are attracted more by the bright lights and amusements of promenading in Casablanca’s center or sitting in its cafe's, where they are freer than in their own quarter to meet friends. There are virtually no cafds, cinemas, or recreational facilities beyond the streets and vacant land on the quarter’s edge. In all, the quarter shows only minimally the forms of solidarity which develop in older, more established madmas or even in the city’s bidonvilles, where residents are perhaps compelled to cooperate more with each other.

*** Cities and Social Class

One of the few substantial attempts to relate the impact of shifts in world economic currents upon the social order of a Middle Eastern city is Kenneth L. Brown's People of Sale. Brown makes the important point, confirmed by numerous other studies, that status and social relations were not determined by any fixed characteristics. Attributes such as Arab or Berber identity, religious learning, patrilineal descent, and membership in occupational groups and religious brotherhoods constituted "cultural categories, not concrete, isolated social aggregations or classes." Social relations were instead "characterized by a pattern of shifting coalitions, of networks of patrons and clients" based upon common interests that were "sometimes strengthened (but not determined) by descent, marriage, or friendship."[425] His description of the elite of the city is likewise congruent with descriptions of other Middle Eastern contexts. They were persons "who dominated cross-cutting social networks" and who were less leaders of "powerful extended families" than "men who controlled clientele groups held together by mutual interests, not ties of consanguity."[426]

The long-range consequences of capitalist and colonial penetration, Brown argues, were to create a situation in which a few entrepreneurs amassed considerable wealth while the majority of small merchants, artisans, and peasants became increasingly impoverished and social mobility became more difficult. Stated in the abstract this theme of the growth of class relationships instead of vertical ones of patron-client and other ties recurs in contemporary anthropological and social historical literature. Brown's almost unique contribution is twofold. First, he analyzes in detail and over long historical periods the consequences for particular crafts and mercantile activities of these economic and political changes; most other studies merely juxtapose before and after contexts without assessing the interplay between market forces and social relations. Second, he argues that the "local patterns of relationships," which he meticulously describes, remain largely intact and to date have not led to a "class-based social structure."[427] Thus, even with the growing differentiation of persons along lines of wealth, individuals perceived their "interests" in a multiplicity of settings and manipulated an intricate range of identities and loyalties.

If the growing importance of economic differentiation was apparent in the critical period dealt with by Brown through the 1930s, it has become much more so in the accelerated social change of the post-World War Two era. For this more recent period, Alan Duben's (Dubetsky's) 1970-1971 research in a mahalle (neighborhood) of thirty thousand persons which he calls Aktepe, located on the outskirts of Istanbul, is one of the more intensive studies available. Aktepe's population is heterogeneous in origin, ranging from the "religiously conservative" Black Sea Sunni-s to Alevi-s from east and east-central Anatolia. Duben is concerned with understanding the interplay between older notions of consociation, which he glosses as "the moral community which is Islam," and "the organization of individuals according to social class."[428]

Aktepe is divided into two principal quarters. One is. occupied by people of Black Sea origin (“Laz” territory, after the principal ethnic characterization of the Black Sea region). The other consists predominantly of persons of eastern Anatolian origin. It is known as “Kurdish” territory, although not all persons from this region are Kurds. A few persons from other regions are interspersed in these two quarters. This regional/ethnic distinction is also taken as a religious one. The Kurds (Alevi-s) live in the lower part of the neighborhood. There are no mosques there and during Ramadan a number of residents appear not to be keeping the fast. In contrast, the upper Sunm (“Laz”) part of the neighborhood has two mosques. Although administratively united, Duben characterizes the upper and lower quarters of Aktepe as “two rather different moral communities” in terms of the “objective facts” of regional ties, marriage patterns, and “different religious belief systems.” In the sense that a “moral community is a self-conscious social unit,” the residents of the two quarters belong to different social worlds; in this sense their differences are comparable to those of the two suburban Lebanese communities described by Khuri in From Village to Suburb. [429]

The pattern of migrants settling in Aktepe is much the same as that described by Abu-Lughod for Cairo. Persons from the same village or general region settle together. In the case of Aktepe, a common pattern is for persons first of all to construct single-story makeshift homes and later to move into four- and five-floor modern apartment buildings nearby. There is an evident differentiation of wealth and occupation, as a few laborers have formed their own small workshops or as others become successful as entrepreneurs in real estate or in commerce. Most residents of the quarter remain laborers, either in the small workshops and factories within Aktepe itself or in the large industrial zone which adjoins it.

Duben views classes “as conflict groups determined by their relation to the means of production.” He argues that it is more useful to consider classes merely as one type of conflict group, together with others such as “status groups, sects, or regional groupings.”[430] There is an unequal distribution of wealth and power among Aktepe’s residents, as elsewhere in Turkey, but for Duben the nature of significant groupings within this inegalitarian framework remains to be classified empirically; he does not regard the formation of social classes as a self-evident

FIGURE 10-11 Workers in small factories and workshops are thought to work better when they are all from the same region of origin. Aktepe, Turkey. (Courtesy Alan Duben.)

phenomenon nor the existence of other forms of conflict groups as a “false” consciousness. All such groupings which are significant to the members of a particular society and which serve as a guide to social action must be taken into consideration. For Duben, any use of terms such as class must take into account both the social and historical institutions of the society being studied and economic and ! social forces from outside the

area.[42] In fact, he reviews recent work on the consequences of industrialization in non-Westem contexts which suggest that | increasing social differentiation, including the separation of kinship ties from those of work, is not a necessary concomitant of industrial development. In the Turkish case, he points out that in many of the small factories and workshops of Aktepe, workers are hired according to the patron's assessment of a worker's reliability and j trustworthiness (diirustluk). Such relationships of trust are particularly developed j among persons with a common religious identity. Patrons and workers are linked by

J a complex of social obligations which extend beyond the workplace. Some of the

larger workplaces even provide mosques on their premises. These complex bonds of social obligations ensure the workers' loyalty. The principle of recruiting workers with such common bonds is also followed by larger industries such as textile factories. Only when a high level of skill is necessary are technical factors given predominance. Duben's argument is that these "traditional" social alignments structure the workplace and contribute to its effective functioning. In short, the more important grouping for patrons and workers is community instead of class, and bonds of class solidarity are not inevitably a consequence of increasing economic differentiation. Neighborhood improvement associations among both the

^Ibid., pp. 364-65.

Alevi "Kurds" and the Sunni "Laz" populations pay for the support of various community facilities, including primary schools, dispensaries, and (for the Sunni population) a mosque, and the wealthier members of the two communities are the leaders in these associations.[43]

Nonetheless, Duben acknowledges the development of a "politically conscious" labor movement and the growth of class consciousness among some Turks. He concludes that such consciousness has become increasingly important, particularly in Turkey's larger industries and among workers returning from Europe; but that in Aktepe, where most Individuals work in smaller factories and workshops, a sense of distinct class has developed most clearly only among the patrons. Their wealth and mobility enables them to meet other persons in similar positions elsewhere in the city, and many are becoming distinguished by a distinctive style of dress and manners. In Duben's argument, class differentiation is becoming more significant, but a comprehension of how it shapes Turkish notions of society and identity necessitates comprehending other forms of social cohesion as well and not postulating that class consciousness alone will shape the future.[44]

Another valuable argument concerning the significance of class relationships in an urban context is provided by the work of Nicholas S. Hopkins in Testour, Tunisia, a town about fifty miles southwest of Tunis with approximately ten thousand persons in the mid-1970s.[45] The town is an active craft and marketing center in the middle of a fertile region with an economy of extensive agriculture based on wheat, barley, and olives as well as irrigated orchards and gardens. Much of the land and many of the flocks in the region are owned by townsmen. In Hopkins's study as in others concerned with the concept of class, constant reference is necessarily made to the national and international economic and political context; although Hopkins stresses the advantage which anthropologists possess in being able to ascertain empirically the significance of the notion of class. Hopkins, like Duben, stresses the importance of the differential access which members of society have to the mode of production, the emergence of two (and sometimes more) groups based on this differential access, and the political opposition associated with them. This "contradictory relationship" does not mean that humans are lined up like manikins on the dominating or dominated sides of the class line or that notions of class can automatically be derived from the mode of production. The "life experience" of individuals, the "degree of consciousness" of class, and observations of behavior (which can be an indirect index of class) are all equally important and must be taken into account. Individuals must possess the ideologi-

Dubetsky, "Class and Community," pp. 368-69.

[4s] Nicholas S. Hopkins, "The Emergence of Class in a Tunisian Town," International Journal of Middle East Studies, 8, no. 4 (October 1977), 453-91, and his "The Articulation of the Modes of Production: Tailoring in Tunisia," American Ethnologist, 5, no. 3 (August 1978), 468-83.

cal forms in which to express class consciousness, and Hopkins sensitively portrays just what the nature of these forms is and their relation to the mode of production in one Tunisian context.[431]

Hopkins suggests that the most important factors in the emergence of class i consciousness in the Testour context are the improvement of communications and the mechanization of agriculture which have made a market orientation possible and that change in productive forces is linked with changes in other aspects of society.[432]

j In earlier, especially precolonial, times, the work force was mobilized from

! within the family and extended kin, with the occasional use of various sharing arrangements. This earlier system of production was correlated with a complex evaluative process involving wealth, religious status, and the honorable behavior of 'j family members, and links within the society tended to be vertical, patron-client ; ones. Land was concentrated in the hands of town notables. With the shift to

i mechanized agriculture beginning with the colonial period, there has been a shift

to agricultural wage labor along with the emergence of horizontal social links in which many persons recognize their common interests with other persons in j society. This has particularly been the case for landowners and for agricultural workers. Employers for the most part tend to be Testouris. They live in the center of town, share a number of activities together, including control of some of the key local shrines, and think of themselves as a group. The agricultural laborers tend to be migrants from poorer regions of Tunisia who live in adobe houses on the periphery of the town itself. Their tenure in the houses is insecure. Employers speak of the lack of confidence (thiqa) they have in their workers, claiming that the j workers are bad Muslims and even practice witchcraft. The laborers, for their part, have to some extent organized (as have the employers) to defend their common interests, such as gaining more secure title to their houses and obtaining better

' - working conditions.

! Hopkins clearly points out that the class system which he is describing does

not embrace the entire population. There are still a number of independent small j farmers who own and work their land, and a number of people in transport, crafts, and mercantile activities who are not enveloped by the class system. In his intensive study of tailoring, for instance, Hopkins has described an aggregate shift in the mode of production from an artisanal to a manufacturing mode of product'on. Many tailors accept piecework at unfavorable rates but do so because of a vaiue system in which independence or the appearance of-it is highly valued. A cooperative might secure them a higher return for their labor, but the tailors would have to give up some of their independence. Because of their value system workers tend “to think in terms of individual advancement rather than collective experience.” As a result, tailors do not realize the commonality of their interests. Hopkins concludes that they are not fully integrated into the capitalist mode of production, but that once they are, then there might be a “full emergence of class relations.”[48] Hopkins goes beyond Duben in suggesting that class relationships will eventually diminish

the importance of all other forms of relationship, and that certain “value systems” impede some persons and categories of occupations from realizing where their economic interests lie. Both of their analyses stress the importance of considering how class relations articulate with other forms of social solidarity and identity.

In, discussions of the emergence of class relationships, the importance of the distinction between the anthropology of cities and the anthropology in cities becomes paramount. The emergence of class relationships is a process which affects entire economies and regions and cannot be confined to a discussion of urban milieus. Certain transformations may appear more pronounced in urban contexts but cannot be explained within those contexts alone.

** 11. Political Economy: Past and Present

Speculation about connections between economics and politics becomes much more profitable when one focuses not on the roughest outline, but on the finer features.[1]

In nineteenth-century anthropology, long-term perspectives prevailed which conceived of cultural and civilizational growth in terms of developmental stages much like geological layers. These models were discarded when too few examples could be found to fit the stages meaningfully. Today, anthropologists and scholars in related disciplines , are shifting their attention to how systems of meaning shape and are in turn shaped by configurations of power and economic relations in different societies. This has resulted in a renewed interest in long-term perspectives on the societies they study, but with markedly different assumptions than those of the past.

Patterns of trade relations are a case in point. Archaeologists and social historians interested in ancient trade assumed all too readily that in the past the movement of goods followed habitual patterns. More recently it has been argued that patterns of trade, symbiosis and predation often begin and are broken off in “dizzyingly abrupt shifts” in which entrepreneurs and “self-conscious individuals and groups” take advantage of risks and uncertainties rapidly to innovate and to adapt to situations not fully known or perhaps unlpiowable. Instead of gradualist progress along an evolutionary ladder to more complex organization, increases in scale and complexity are seen to depend much more upon reactions to situations and opportunities in which individuals are never fully conscious of where their actions and ideas ultimately will lead. Nonetheless, meaningful correlations can be made between forms of

production, political authority, and the ideologies which people use to shape and to make sense of these developments? Such arguments have been most intensively pursued in the contexts of the ancient Near East and medieval Europe, but such a perspective is equally useful in understanding the empires of the medieval Middle East and the states of the present.

'Albert O. Hirschman, A Bias for Hope: Essays on Development and Latin America (New Haven and London: Yale University Press, 1971), p. 9.

In the Middle East as elsewhere in the world, anthropologists have produced valuable studies of local-level politics, administration, and economics. Unlike some other parts of the world, social historical resources are available to place such studies in the broader perspective which is necessary to comprehend just what politics and economics mean today and meant in the past. In studying such topics, the contribution of anthropology has been to look at the “finer features” of the relation, not always a straightforward one, between politics, economics, native concepts of the social order, and programs of development and progress, in short, political economy. This chapter analyzes the approaches which anthropologists have used to make sense of rapid social, political, and cultural change in the Middle East today and to relate them to the historical past.

*** Medieval *Muslim* States: Problems of Authority and Interpretation

As a focus of scholarly inquiry, the medieval Middle East has concerned anthropologists and social historians, even those primarily interested in postmedieval periods, in two principal ways. First, Islamic empires and states have frequently been characterized by historians and sociologists as representing extreme types of political authority. In his analysis of the writings of Max Weber on Islam, Bryan S. Turner concludes that Weber concentrated upon analyzing two aspects of domination in the Muslim world: the charismatic authority represented by the Prophet Muhammad and sultanism, representing for Weber the arbitrary free will of the ruler released from most traditional limitations? The second principal use of

[2] Quoted material is from Robert McC. Adams, “Anthropological Perspectives on Ancient Trade,” Current Anthropology, 15, no. 3 (September 1974), 239-58; see also Jane Schneider, “Peacocks and Penguins: The Political Economy of European Cloths and Colors,” American Ethnologist, 5, no. 3 (August 1978), 413-47.

[3] Bryan S. Turner, 'Weber and Islam: A Critical Study (London and Boston: Routledge & Kegan Paul, 1974), pp. 75-92. The following account of Weber's ideas derives largely from Turner's excellent discussion. See also his Marx and the End of Orientalism, Controversies in Sociology, 7 (London: George Allen & Unwin, 1978). This short study is essentially a review the medieval period—"classical Islam" or "the grandeur that was" in the phrasing of some Orientalists—was to serve as a backdrop against which the "decline" of the Middle East could be measured. Coon's mosaic characterization of Middle Eastern polities and other prevailing ahistorical images of Middle Eastern societies derive from the general assumptions made of this period, and the ideological assumption of the decline of the region in many instances provided a convenient justification for colonial intervention.

As Turner indicates, Weber's investigations concerning Islamic society were not as complete as his interpretations of other civilizational traditions and he "often failed to adhere to his own methodological principles" of seeking to understand the motivations and intentions of individuals acting in particular historical contexts. "In Weber's analysis, it was the patrimonial structure of traditional Islam which was incompatible with political radicalism, the freedom of cities, the autonomy of rational law and hence with the emergence of capitalism."[4]

Over a period of several centuries, what Weber and others considered to be the "classical" form of Islamic society emerged based upon a combination of patrimonial politics (as in the social order of cities) and of feudalism. Turner explains in the following manner how these two principles were supposed to combine. A patrimonial ruler (whose rule in its most primitive form is "characteristic of the authority of a lord over his own household") seeks to convert his extended family ■ and others into dependent subjects. A principal way of doing this is through the use of slaves and mercenaries who are dependent upon the royal household. The patrimonial ruler must then seek to minimize the independence of his mercenaries and that of notables and merchants. One technique of doing this was to make official appointments deliberately insecure so that subordinates could be used as J scapegoats for popular discontent and the ruler could preserve the "fiction that he is benevolent and concerned for the welfare of his subjects." Turner explains that the paradox of this form of rule and especially of sultanism, its most extreme form, is that "the more a ruler has to rely on his mercenaries or slave army, the more dependent he becomes on their power to subjugate the masses." Soon, mercenary armies are able to extract fiefs and regular advantages from the ruler, forcing him ■ further to pauperize the peasantry while continuing to represent himself as the people's benefactor. The result is two forms of protest: periodic millennial outbursts, usually based upon religious principles, and the "periodic dynastic, political change" which did not result in the change of form of rule but which resulted in prolonged conflicts over succession.[5]

essay concerning the major approaches to the understanding of the Middle East in the light of "critical" Marxist theory. Turner's general tone on the state of Middle Eastern studies is

dyspeptic; he doubts whether the study of the Middle East has contributed significantly to the analytic development of the academic disciplines involved, although he concedes that anthropology “may be” partially exempt from his negative judgment (p. 1).

[4] Turner, Weber, p. 75.

[5] Ibid., pp. 80-81.

f This central problem in the succession of dynasties was recognized by

t medieval Muslim intellectuals themselves, of whom the best known is the North

African Ibn Khaldun (d. 1406). His theories of dynastic succession are worth L introducing here because a succession of scholars, including Ernest Gellner, have

| used Ibn Khaldun as a point of departure for their own discussions of the nature of

j premodern political authority.[433] Together with other contemporaries, Ibn Khaldun

acquired an education by traveling to various centers of learning throughout North | Africa and the Middle East, serving as counselor of state to a number of North

i African rulers and to Spanish ones when Spain was still under Muslim domination.

Ibn Khaldun makes for fascinating reading even today, as he had to struggle to create a vocabulary through which he could articulate sociologically the rise and decay of dynasties throughout the Muslim world.

Ibn Khaldun must have been acutely sensitive to the problems of the decay of dynasties and political domination, for in his lifetime the Spanish Muslim principalities collapsed one after another. One clear threat was from Christian invaders; another was from sudden shifts in the political climate of the Muslim world itself. It has sometimes been argued that Ibn Khaldun sought to provide a universal model for political developments. I prefer to think that he was primarily concerned with medieval North Africa and southern Spain, from where most of his

examples are drawn. His observations on the nature of political domination make more sense in j this primary context than if they are made to encompass all forms of domination.

I Ibn Khaldun sees the successive ideal stages of a dynasty as follows. At its

i inception, it must possess “group feeling” ([z] asabtya), which roughly can be glossed

j by acting as if compelling ties of obligation bind members of a group together. Such

compelling notions of group feeling are more likely to be found in rural or tribal contexts (the notion that group feeling is primarily confined to nomads or Bedouin is, I think, based on a misinterpretation of the Arabic original). Group feeling need not depend upon blood relationships existing between those persons who share it, but the bonds of solidarity must be such that they take precedence over all other bonds of association. The parallels of this notion with the contemporary notion of “closeness,” discussed in Chapter 6, are obvious. Such ties imply that persons act together in one another’s interests over extended periods of time. Ibn Khaldun suggests that such solidarity is needed for a dynasty to come into existence, and he gives a number of examples from the North African context. Moreover, he argues that a new dynasty is most likely to be established when it can claim a religious basis of legitimacy: prophecy, reform or some other “religious coloring.” Only with group feeling can a religious ideology be practically implemented; thus Ibn Khaldun used the notion to link ideologies to their political contexts.

Like most political thinkers, Ibn Khaldun chose a striking metaphor to depict his view of the nature of political change, the metaphor of the human life span—growth, maturity, and decay. Each stage of this cycle generated the conditions necessary for the next, and in this sense his theory of dynastic change is pessimistic because he saw the cyclical succession of stages as inevitable.

The first of his stages was the overthrow of an earlier dynasty and the appro- ■ priation of royal authority (mulk). The ruler at this stage appropriates few luxuries for himself and serves as a model of discipline, nobleness, and restraint to his followers.

In the second stage of authority, the ruler gains complete control over his people and appropriates royal authority entirely to himself. Now he is interested in acquiring adherents and followers in greater numbers and in barring those who helped him to power from appropriating any of his authority. He spends as much time in subduing his potential challengers as the first member of the dynasty spent in the overthrow of his predecessors.

The third stage is one of leisure and tranquility in which the ruler and his entourage enjoy the fruits of royal authority. Monuments and public benefices commemorating the dynasty are erected and largesse is distributed to the dynasty's supporters. The ruler's talents are now directed to bookkeeping and planning. This | stage merges imperceptibly into the fourth, one of contentment and peacefulness,

: in which the ruler is satisfied with what his predecessors have built. He relies upon

and imitates the ways of his predecessors.

The final stage is one of waste and squandering. The ruler spends his time in pleasures and amusements, dissipating the former strength of his regime. To maintain himself in power, he seeks to destroy all those whom he regards as competent to replace him and thus tends to surround himself with incompetent lackeys. This is the stage of senility of the dynasty when it is ripe for collapse.

For later generations of Western scholars influenced by Ibn Khaldun, the organization and nature of political power within the Ottoman empire has been a source of fascination and until recently the point from which the "decline" of Middle Eastern civilization was measured. The Ottoman empire, at its height in the seventeenth century, controlled a significant part of the Middle Eastern Muslim world and parts of eastern Europe. Gustave E. von Grunebaum, one of the best known scholars of the twentieth century, had the Ottoman empire in mind when he depicted the principles of order in "Islamic" societies in highly formal terms. These were: the separation of the Muslim from the non-Muslim subject; the setting apart (and toleration) of a number of different religious groups under the aegis of Islam in which Christians, Jews, and Zoroastrians possessed a large measure of internal autonomy for their own communities; the marking off of different "nationalities" within the Islamic community; and the narrow delimitation of

"social distinctions that assigned people to a more or less definite hierarchy of professions."[434] The mere delineation of these "principles" suggests von Giunebaum's assumption of rigid social hierarchies and distinctions in contrast to the more flexible notions of social order suggested by scholars such as Ira Lapidus and Richard Bulliet, who seek a more thoroughly sociological comprehension of medieval Muslim society instead of a search for a timeless "essence."

A number of analyses exist of the implicit assumptions concerning "oriental" rule made by a prior generation of scholars.[435] The rather contradictory earlier assumptions are

characterized as follows by Talal Asad, based primarily upon the influential works of Sir Hamilton Gibb, von Grunebaum, and Snouck Hurgronje:

An emphasis on the absolute power of the ruler, and the whimsical, generally illegitimate nature of his demands; on the indifference or involuntary submission on the part of the ruled; on a somewhat irrational form of conflict in which sudden, irresponsible urges to riot are met with violent repression; and, finally, an emphasis on the overall inefficiency and corruption of political life.[436]

It is relevant here simply to note these assumptions, not to show how they masked a highly fluid situation, as Roger Owen has sought to do in indicating how a greater knowledge of economic conditions in the period of Ottoman rule, for example, the development of cash crops in the regions of Lower Egypt, Mount Lebanon, and Izmir, the rapid spread of maize cultivation throughout the seventeenth century, and shifting patterns of trade, can be related to specific political and social developments. Earlier scholars tended to disregard the importance of trade and economics in their accounts of Islamic polities.[437] Similarly, many of the “spontaneous” riots in cities and rural regions during Ottoman times are beginning to be studied, like comparable phenomena in Europe, as popular reactions against accepted notions of political and economic justice. If grain was hoarded by merchants and the price of bread became unconscionable, so-called rioters became violent only when authorities refused to enforce prices which were considered just. In some of the Arab Gulf states, merchants and fishermen at the end of the nineteenth century simply voted with their feet and moved to another city-state if the ruling family sought to make illegitimate exactions. The option of migration effectively provided an informal check on the excesses of rulers.[438] In larger states, the fact that mosques often were the rallying points for demonstrations suggests that “rioters” considered their demands to be moral and just. As with the layout of traditional cities in the Middle East, the imagined “irrationality” of the “crowd” often has been nothing more than a failure on the part of earlier scholars to perceive implicit assumptions of legitimacy and justice. In any case, a convenient excuse for colonial rule was the presumed inability of the “Orient” to govern itself responsibly. As Edward Said has stated, a concrete and conscientious understanding of Middle Eastern societies and civilizations will emerge only when specific societies and problems of the Middle East are studied instead of the “Orient” writ large, or an Islamic “essence,” or the “Arab mind.”[439]

One of the few anthropologists whose approach is singled out for approval by Said is Clifford Geertz. The latter’s analysis of the royal progress in nineteenthcentury Morocco can be taken as an example of how popular notions of legitimacy for contemporary or historically known periods can be elicited.[440] A royal progress is a journey by a monarch throughout his domain which symbolically establishes or reaffirms possession of the realm. For Geertz, the royal progress is a striking symbolic representation of how political domination is asserted. In fact, he argues that an examination of the symbols of power and the nature of power often shows that both are one and the same thing, a conjunction especially apparent in traditional monarchies as opposed to modem political regimes in which the relation between the symbols of power and men of power is better disguised.[441]

In medieval England, the monarch was entertained during the royal progress with public pageants in which subjects dressed up in costumes which depicted the virtues of the realm and the vices which threatened it. In nineteenth-century Morocco, “strength did not have to be represented as other than what it was.” Society was “a tournament of wills,” and hence so was kingship and its symbolism: “Progresses here were not always easy to tell from raids.”[442] Geertz’s language is more luxurious than my brief account can begin to suggest, but in essence he argues that the surest sign of grace, baraka, was the ability of one man to prevail over another. A number of strongmen—qaids, pashas, marabouts, and others—sought to build and maintain personal configurations of power, with the sultan striving to dominate them all.

In Morocco of the eighteenth and nineteenth centuries, the fertile Atlantic plains and those of the region of Fez and Meknes were firmly dominated by the sul-

FIGURE 11-1 Royal mahalla, Morocco, 1911. (From Gaston Doumargue, Histoire popv- iaire des Colonies franqaises [Paris: Editions du Ve'lin, 1932], p. 112.)

tan, but his authority was threatened on all sides by “charismatic adventurers” and periodically had to be reestablished. For the sultan to affirm his boraka and hence his “capacity to dominate,” he quite simply had to prevail over others. “[Baraka] was not a condition, like chastity, or a trait, like pride, that shines by itself but a movement, like will, that exists in its impact.”[443] g

One way of demonstrating this capacity was through a royal progress (harka or mahalla), and Geertz describes in detail the last major one by Sultan Mulay Hasan I (d. 1894). Mulay Hasan was usually on the move half of each year, shifting his capital periodically among the so-called imperial cities—Fez, Marrakesh, Meknes, and Rabat. When he moved beyond these capitals, his entourage often numbered between thirty thousand and forty thousand persons. A suitable chastisement for a region unwilling to pay its share of taxes was for the harka to stop in one place consuming the grain and herds of the region until tribes and their leaders were worn into renewed submission. Geertz’s argument is that the mobility of the sultan was a central element both in his power and, inseparably, in the concept of royal authority in Morocco. “The realm was unified ... by a restless searching-out of contact, most of it agonistic, with literally hundreds of lesser centers of power within it.”[444]

The resiliency of the forms in which political domination is expressed is demonstrated by their use throughout the colonial era and after Morocco regained its independence in 1956. In the colonial era, royal progresses included officials of the French residence traveling with the sultan (after 1956 sultan was replaced by the more modem designation of king (malik); in nationalist circles the newer designation was

common currency from at least the mid-1940s) and appearing in all formal ceremonials except specifically religious ones. The symbolism of the colonial royal progress also included[3] such features as visits by the sultan to the tomb of the unknown soldier in France and other ceremonies visually suggesting the “protected” status of the royal family. In the current fighting for control and sovereignty in the Sahara, those tribal groups wishing to express fealty to the Moroccan throne continue to do so in the form of the traditional oath of fealty (bay^ca), in which tribal delegations offer sacrifices of bulls and sheep to renew their covenant with the Moroccan throne.[445] The “Green March” of King Hasan II to the Sahara in 1976 with tens of thousands of Moroccans can also be seen as a classical royal progress. Similarly symbolism prevails in the conduct of monarchies and republics elsewhere.

*** The Colonial Experience

Many anthropological studies were conducted during the colonial era in the Middle East although, with the exception of French North Africa, these studies were generally not as intensive and thorough as those conducted by English social anthropologists in Black Africa. Many of the contributions to Gellner and Micaud’s Arabs and Berbers suggest the continuing pervasiveness of the categories initially created by French colonial sociologists: Arabs versus Berbers, town versus tribe, lands of submission (to royal authority) versus lands of dissidence, and other stereotypic representations of North African society.[449] Some of the studies in the Gellner and Micaud volume, notably that of Edmund Burke III, indicate how this “colonial vulgate” came into being; a few merely take the colonial vulgate for granted; others continue to use the colonial vulgate as a scholarly point of departure. Even as late as 1951, when independence movements in the Middle East were rapidly gaining momentum, one of the most distinguished French ethnographers (earlier a military officer) of colonial Morocco could brush aside the delay in publication of a book on Moroccan religious brotherhoods by writing that in Islam “evolution is boundlessly slow. For Islam, even more than for other religions, one has to count not in years but in centuries.”[450] These sentiments matched precisely the notion of the timeless nature of “Oriental” society prevalent in the nineteenth century. Still other studies exist which, like their equivalents in Black Africa, ignored almost completely the impact of colonial administration upon political life. Local disputes were treated as if they had no wider implications and the relations between native officials and foreign administrators, as with the impact of the expropriation of indigenous lands, were mentioned only in passing. One of the few exceptions to these strictures was Evans-Pritchard’s study of the Italian colonization of Libya, significantly a study made of the policies of a defeated European power.[451] Evans- Pritchard made no similar analysis of colonial rule in regions under British domination.

At one time or another in the past century and a half, most of the Middle East has experienced colonial domination or, in the case of the Arab Gulf states, decisive foreign influence. This fact is significant in two ways. Colonial society can be studied in itself as a unique, and now passing, social form, as the discussion of colonial urbanization in Chapter

10 has suggested. Secondly, colonial domination has had a formative influence on the shape of the present Middle Eastern polities and societies.

Rene Maunier, at one time head of the French Academy of Colonial Science, defined colonialism as “occupation with domination and emigration with government.”[452] His definition has the advantage of facilitating the comparative study of colonial systems, a field in which Maunier was a leader. His book on the sociology of colonies was for a long time one of the standard texts on the subject, in which Maunier discussed the early Phoenician colonies of the Mediterranean, the Roman Empire, and the more recent experience of European colonial expansion and reactions to it.

The notion of a “colonial science” is of course an indication that colonial rule could be rationalized and systematized and was here to stay, an idea perhaps easy to accept (for Europeans at least) in the early 1930s, when congresses were routinely held in Europe and attended by representatives of various colonial administrations. Jacques Berque, a prominent French social historian of colonial rule in North Africa, suggests that 1930 be taken as its apogee.[453] The year was marked by

FIGURE 11-2 Jacques Berque, in uniform, center right, with General Nogues, Resident-General of Morocco and notables of Fez, October 1937. Berque is today one of France's most distinguished interpreters of Middle Eastern civilizations. (Courtesy Jacques Berque.)

an International Colonial Exposition in France, and celebrations took place throughout the year to commemorate the centenary of French Algeria.

The 1918 European armistice is a convenient point from which to survey the extent of colonial dominion in the Middle East. All the Levant except Turkey was firmly occupied by colonial powers, and only stiff resistance by the Turks kept Anatolia as well from succumbing to foreign domination. Syria and Lebanon were under the French, the spoils of the defeated Ottoman empire. Iraq was under the British, who also exercised a major influence over the mini-states of the Persian/ Arab Gulf, with British residents exercising significant control over tribal politics and ordering air strikes when necessary to facilitate accommodation to British imperial interests. Saudi Arabia managed to escape the direct impact of European colonial control, mainly because its autonomy suited the European colonial powers. Both Jordan and Palestine fell within the British sphere of domination. Egypt had been under English domination since 1882, although like the other countries, significant European control over its finances dated from an earlier period. In the Levant as in Egypt, there was virtually no European settlement, although Greeks and others served as artisans in larger cities such as Alexandria, and the British performed many of the higher administrative and military functions, effectively blocking training for Middle Easterners themselves. The prevalent thought of such rule, to paraphrase Lord Cromer, one of the British proconsuls in Egypt, was

to do what was good for “Orientals,” not necessarily to do what they thought was good for themselves.

Each North African country from Libya to Morocco experienced colonialism

FIGURE 11-3 British political residents in the Arab Gulf states commonly adopted Arab dress as late as the 1930s. H. R. P. Dickson, British Resident for Kuwait and his wife. (From H. R. P. Dickson, The Arab of the Desert [London: George Allen & Unwin Ltd., 19491, opp. p. 48.)

in a different form, but all had a significant population of European settlers. The short-lived Italian colonial experiment in Libya is instructive.[24] In 1911 Italy joined the other European powers in the scramble for power, and by the followingyear the Ottomans ceded Libya to them. By 1931 a major influx of settlers had begun, each allotted lands, houses, and tools at government expense, the property tosbecome theirs after 20 years of labor. There were only 30,000 settlers in 1921,50,000 by 1931, and 150,000 by 1940. These settlers were concentrated in the fertile lands of the north. To make room for them, the native population was forced to emigrate to the less productive parts of the country or was confined to camps. At the height of Italy’s dominion of Libya, roughly one-fifth of the country was Italian. As with the other countries in the Maghrib, concern for the indigenous population was decidedly secondary.

The rest of North Africa came under French colonial domination, with the exception of Morocco’s northern zone and its southern fringes, both of which came under Spanish rule. The earliest French colony in North Africa was Algeria, first occupied by the French in 1830 by means of tactics recognized as brutal even in terms of contemporary standards.[454] Native lands were systematically expropriated, traditional learning and administration were systematically destroyed. Even advocates of French colonial expansion recognized the misrule and brutality expert-

24

See Evans-Pritchard, The Sanusi.

enced by the colony. The presence of a large-settler class effectively wrested control of the administration from metropolitan Fiance, Between Algerian French and Algerian Muslims there was a marked tradition of violence and mutual incomprehension from the very beginning of colonial rule.

Morocco, in contrast, was the last North African territory to be brought into the French empire (1912), and it was considered by many French to be the jewel of their colonies—an example of “scientific” colonialism at its best. It certainly was the best studied; no Middle Eastern country under English domination has been as thoroughly described ethnographically. One can only concur with Edmund Burke III’s judgment that an assessment today of the work of the earlier generation of colonial ethnographers concerned with Morocco can prove to be highly valuable even if one disagrees with the implicit assumptions of their work and the motivation for it. The corpus of ethnographic work is of high quality and the intensity of the work undertaken makes Morocco “a particularly illuminating place to study the ways in which colonial ethnographers went about their business in the generation or so preceding the First World War.”[455]

The French intention to colonize Morocco was clear by the end of the nineteenth century, but opposition by the British and the Germans to direct French expansion prevented direct colonization.[456] Nonetheless, clandestine domination took place. One means was by military expansion in Morocco’s southeast, where oases were forced to collaborate with the French or risk destruction of their date palms and herds. Another device (used as well throughout the Middle East in various guises) was through control of the police of the major Moroccan ports (together with the Spanish), collection of customs revenues, expansion of commercial operations with extraterritorial protection granted to Moroccans acting in French interests, and from 1907 the creation of the Bank of Morocco to control the country’s finances. Ostensibly these measures were to ensure repayment of loans forced upon Morocco by European countries, often at highly disadvantageous terms. By 1907, using as a pretext the struggle over control of the throne between the brothers Mulay ^cAbd al-^cAziz and Mulay Hafid, three thousand French and five hundred Spanish troops landed at Casablanca and began to occupy the surrounding region to protect the port. The following year the expeditionary force had expanded to fifteen thousand men, and beginning in 1910 Morocco was compelled to indemnify the French for the cost of the force.

Finally in November 1911 the French reached an agreement with the other major European powers, and the road was clear for the direct occupation of Morocco. Five thousand troops advanced from Algeria to Fez, where Mulay Haffd was in his palace. The Spaniards occupied points along Morocco’s northern coast. Moroccan ability to resist these incursions was virtually nil. In March, the Minister of France at Tangier (where all embassies to Morocco were situated) set out to Fez on horseback. The sultan briefly considered resistance but finally agreed to sign the treaty of the protectorate after six days of being bullied by the French. He abdicated almost immediately afterward in favor of his younger brother, Mulay Yusif. Formal French domination of Morocco had begun.

Louis Hubert Gonzalve Lyautey was appointed first Resident-General of Morocco (1912-1925). During the period of his administration he set the tone for what was considered to be an enlightened, “scientific” colonial administration.[457] Lyautey was a champion of “indirect” rule and in fact elaborated an administration which was remarkably economical, requiring only a handful of Frenchmen to supervise vast expenses of territory and which was almost entirely self-financing. He assiduously cultivated ties with Morocco’s urban aristocracy and rural strongmen, often overlooking their excesses in exchange for their continued support. Thus

FIGURE 11-4 Lyautey, Resident-General of Morocco, talks with Berber leaders, c. 1913. (From Doumergue, Histoire Populaire, p. 30.)

during the difficult period of the initial takeover of Morocco, when there was pronounced resistance in many regions, Lyautey sent letters by messenger to Moroccan notables, an act which in itself indicated the sophisticated French knowledge of Morocco, stating that their interests would be protected if they proved themselves to be “friends” of France. France, the letters explained, was in Morocco only to defend the interests of the sultanate. It is unlikely that many Moroccan notables were convinced by this claim, but they had the terrifying example before them of the fate of Algeria’s elite. Many leaders visited Lyautey directly; others sent emissaries who were reassured of France’s intentions. Medical services were made strategically available and used to further military intelligence, and the French bought grain and animals at high prices to encourage Moroccans to deal with them. When such methods failed, dissident tribes were denied access to markets; transhumant groups were denied vital pastures, and in the last resort villages could be burned and crops destroyed. Most military operations were accomplished with relatively few losses; in any case, many soldiers fighting for France were from Senegal and other French colonies. Lyautey’s tactics worked so well that when many French forces had to be withdrawn at the beginning of the First World War and French control was precarious, there was no major rebellion against French rule.

Lyautey’s patrician image of how Morocco should be ruled prevented the worst excesses of colonial intervention but by and large prevailed most firmly only in those parts of the country not desired by the growing influx of settlers. For many colonizers, the so-called “civilizing mission” of France was a mere fapade for the acquisition of land and economic gain. For Lyautey, it was something to be taken seriously, as indicated by his insistence upon urban planning, the preservation of Morocco’s traditional architecture, and protection of the interests of those Moroccans designated as notables. He did everything in his power to discourage the development- of a French settler population in Morocco, but it nonetheless developed, along with the flourishing of large commercial enterprises, banks, railroad interests, agribusiness, and mining companies. By the 1920s, the land grabs of the settler population and large commercial interests increased, but even in the expropriation of lands held by Moroccans or in its acquisition by various forms of fraud or administrative

chicanery, the niceties of colonial rhetoric were preserved. In one case the expropriation of a vast tract of land from a tribe in western Morocco was claimed to be beneficial for the tribe involved because it would be “educational” for them to see how European farms were run. [458] This dispossession had serious consequences in turning tribesmen of many regions into a landless, impoverished proletariat.

The impact of French rule in most of Morocco outside of the cities was to freeze a local elite into place. Lyautey’s policy had been to select local strongmen and to maintain them in place if they proved good at the job. If certain strongmen such as Pasha Hajj Thami Glawi of Marrekesh were notorious for their abuses of power, continued French support for them could be rationalized by saying that Moroccans were used to ruthless officials. The pasha’s ability to grasp the nuances of colonial politics meant that he ran Marrakesh and its many lucrative enterprises to his liking until the last days of French rule.

After the 1920s, there were very few changes in local dynasties of privilege and authority until the end of the colonial era. Even then, because of the competitive advantage that such individuals and their families had held in the past, a very common pattern was for brothers, uncles, and cousins in a single family to specialize in the complementary fields of agribusiness, administration, and commerce, thus maintaining their privileged position despite major political and economic changes. It has been argued that until the last days of their rule the French maintained a fragile balance between local elites and the central power at the expense of significant rural social change. This was managed by a succession of independent Moroccan governments dependent upon French support.[30]

Morocco was “improved” by the French, but the educational achievements of the Protectorate speak eloquently of how little emphasis was placed upon providing Moroccans with the skills necessary for the “evolution” promised by France’s civilizing mission. For the French school-aged children in Morocco .education was virtually universal. The education of Jews was for practical purposes in the hands of private organizations and again was virtually universal in towns and cities. As for Moroccan Muslims, in practice only those recognized as the sons (and

social consequences of the expropriation of land for colons. For a meticulous study of another locale, see Paul Pascon, Le Haouz de Marrakech (Rabat: Centre Universitaire de la Recherche Scientifique, 1977). The best long-term study of the relation between political forms and economic conditions in North Africa is Lucette Valensi, Fellahs Tunisians: L ’Economic rurale et la Vie des Campagnes aux 18e et 19e siecles (Paris and The Hague: Mouton, 1977). See also her On the Eve of Colonialism: North Africa before the French Conquest, 1790-1830, translated by Kenneth J. Perkins (New York and London: Africana Publishing Co., 1977 [French orig. 1969]), with accompanying appendices containing interesting primary source materials.

[30] The two best sources on continuity in patterns of the Moroccan elite are John Waterbury, The Commander of the Faithful: The Moroccan Political Elite (New York: Columbia University Press, 1970), and R. Leveau, “The Rural Elite as an Element in the Social Stratification of Morocco,” in Commoners, Climbers and Notables, ed. C. A. O. van Nieuwenhuijze (Leiden: E. J. Brill, 1977), pp. 268-78. Waterbury’s study is perhaps one of the best available to date on the “political culture” of a Middle Eastern country. For one of the rare interpretive essays concerning the sort of men who became colonial administrators in various epochs, see Vincent Monteil (himself a former colonial officer), “Les Bureaux arabes au Maghreb (1833- 1961),” Esprit (November 1961), 575-606.

to a much lesser extent daughters) of notables had relatively easy access to education. Some primary education was provided for the other students, but in general it was felt that only a modicum of education was “realistic.” Moroccans set up their own system of “Free Schools” beginning in the 1930s, so that a “modern” education could be obtained independently from French control, but the standards of these schools were generally mediocre, and they did not provide the certification necessary for governmental and private employment. The educational statistics of the Protectorate almost speak for themselves. Even with a major effort to broaden the educational base after World War II, the results were meager. Of school-age Muslims in Morocco in 1938, only 1.7 percent were in primary school and 0.1 percent in secondary; in 1945 the figures were 2.7 percent and 0.2 percent respectively; in 1950 they were 7.0 percent and 0.6 percent; and in 1955 they were 11.2 percent and 1.2 percent. The dropout rate for primary school alone was 90 percent. As for secondary education, it is sufficient to say that between 1912 and 1956, the years of French rule, only 530 Moroccans had passed the French baccalaureat examination, a necessary prerequisite to entering the university.[459]

The ironies of Protectorate government were abundant. The formal fiction of a Morocco simply under the tutelage of France was preserved, but real political power rested with the French. The sultan could still emerge from his palace on feast days to act as head of the Muslim community and slaughter a sheep on behalf of the Muslims in his domain, but access to him was strictly controlled by the French. All messages to his subordinates had to pass through French hands. Appointments at local administrative levels were chosen from lists of nominees approved by the French. In the name of preserving traditional forms, Moroccan ministers were not permitted offices and desks but had to use low-lying benches. Even Qadl-s, or religious judges, could not assume office until they passed an examination set by a French Orientalist who advised the sultan’s entourage as to whether the candidate possessed an adequate knowledge of Islamic law.

After World War II the colonial system elaborated by the French rapidly disintegrated. Disparities between Europeans and Moroccans had become too pronounced with the dislocation of the wartime black market, the Vichy debacle, the expropriation of tribal lands, rising nationalist expectations, and a monarchy which increasingly asserted its autonomy. The French responded with repression and in 1953 made the decisive error of deposing Sultan Muhammad V in favor of an ineffective relative. The result was to galvanize Moroccan resistance to French rule. Rural terrorism mounted and bloody urban demonstrations and

strikes became routine. The price of maintaining colonial rule became too high, and by late 1955 the French had negotiated the terms of transition to an independent government.

*** The Social Anthropology of the Nation-State

A map of the Middle East through the 1950s still indicated the presence of colonial powers in a number of settings, or of regimes such as the Egyptian and Iraqi monarchies that were regarded by many intellectuals as too close to the interests of the former colonial power. A map of the region today indicates a very different picture. Virtually the only remaining colonial enclaves possessed by European powers are the Spanish presidios of Ceuta and Melilla on Morocco's northern coast (but considered by Spaniards to be an integral part of their nation). The contemporary balance of forces includes religious fundamentalism, varieties of radical socialism and liberal constitutional regimes, and monarchies, each with particular constellations of internal and foreign support.[32] If colonial regimes are easier to grasp analytically and to oppose given their "external" nature, a measure of the balance of forces in contemporary states is a much more complex task. Many governments seek to exploit potential or real distinctions of class, regionalism, religion, and ethnicity in order to destabilize neighboring states considered hostile to their interests. If some issues such as the Palestine question can galvanize popular opinion in some instances into a unity based upon Arab nationalism and Islamic brotherhood, how such bases for unity figure alongside the wide range of potential bases for social unity and difference is a more difficult issue. What political scientists called "nation-building" in the 1960s is a meaningful point of entry into some of the issues involved, although today most scholars would place a much greater emphasis upon the interconnection between economics and politics than was the case when the concept was first developed. [s]

The work of Lloyd A. Fallers illustrates the distinctive contribution which anthropologists have sought to make to the study of nation-states.[33] He argues that the dilemma of the contemporary nation-state is that it unites what in the past was often diverse and scattered, but at the same time it often creates particularism where formerly there was an attachment to more universal ideals, such as those of religion. Fallers argues that nation-states are popular in the sense that both rulers and ruled lay claim to "qualities which are felt to be ancient, inherent, given,however new they may in fact be: language, territory, culture, race."[34] Whether it be celebrated as the "people's liberator" or condemned as more authoritarian than the older empires which it replaced, "the nation-state within an international system of nation-states remains in our time a fundamental feature of the human condition, in spite of widespread aspiration to a more firmly-based international order."[35]

For a preliminary general sketch of some of these cross-currents and the sort of persons who support them, see Abdallah Laroui’s The Crisis of the Arab Intellectual: Traditionalism or Historicism (Berkeley and Los Angeles: University of California Press, 1977).

33

Lloyd A. Fallers, The Social Anthropology of the Nation-State (Chicago: Aldine Publishing Company, 1974).

^Ibid., p. 1.

[35] Ibid., p. 2.

Fallers states that a central issue in the formation of any nation-state is the development of civility, “a tolerant and generous recognition of common attachment to, and responsibility for, the social order, despite diversity.”[460] Cleavages of language, religion, and ethnicity rarely coincide fully with the boundaries of nationstates. In ordinary times, the personal ties of neighborhood and workplace, worship and daily activities do not engage such identities in a potentially destructive way. External threatsfto a nation may allow them to be relegated to the background. But in crisis situations, the ordinarily innocuous acts of daily life can become suffused with larger meaning. A song, an item of clothing, a sporting event, or a funeral may become an incitement to conflict. Fallers writes that such issues are hardly confined to the Third World, as the continuing school busing controversy reminds Americans. Civility is a virtue which must consciously be maintained and which requires the exercise of self-restraint on the part of leaders and intellectuals so as not to appeal to baser sentiments.

An anthropologist can grasp the practical construction and maintenance of civility by using what remains one of the principal techniques of the discipline, the intensive participant-observational study of small groups of men and women in social interaction. As stated in Chapter 1, the fact that such small groups are embedded in much larger entities which are the subject of concern does not in itself create a problem of generalization; as with any other discipline, the issue is how the generalizations are made. By grasping the meaning of civility in particular social circumstances, the anthropologist contributes to the comprehension of how nation-states are elaborated and practically experienced.

The comparative study of nation-building is facilitated by looking at transformations over longer time periods and by evaluating the options of emerging political systems for the integration of their diverse communities, the institutionalization of new forms of social and

political identity, economic development, and notions of what Elbaki Hermassi has called “distributive justice.”[461] As he writes, foreign economic and political domination, international pressures, and endo- geneous and exogeneous factors of change cannot be taken as givens but must be carefully examined in specific instances as to their impact. Even where some of the forces impinging on contemporary societies appear everywhere to be the same, as with international economic pressures, how these are experienced and responded to varies with each society and must be explained in part by its particular historical context. Four contrasting cases are considered here: Turkey, the Sultanate of Oman, Somalia, and Israel. These four examples do not represent the gamut of problems facing Middle Eastern countries or developing nations elsewhere, but each of these countries has significantly transformed its identity or created a new one in the fairly recent past and thus indicates in sharper focus than other possible examples the problems of forging shared identities in a nation-state.

Turkey. Only in the last sixty years could Turkey be considered a nationstate. For more than six centuries before then, it had been at the heart of the polyglot Ottoman empire, controlling a political community that ranged from North Africa and southern Europe to the west and the frontiers of Russia and Persia to the east. This empire was beginning to disintegrate during the nineteenth century, but its demise was hastened by its fateful alliance with the Central Powers during the First World War. In the space of less than a decade after the defeat of 1918, the Turks passed from the status of “faltering imperial overlords to that of nationalist freedom-fighters.”[38]

In his studies of Turkey, the late Lloyd A.. Fallers sought to analyze the impact of this transformation upon Turkish society. He and his wife spent eighteen months in a provincial town in western Turkey, and a much longer period studying Turkish society. The town in question is Edremit. It has a wholly Turkish-Muslim population of some thirty thousand merchants, artisans, olive growers, wage workers, and small commercial and industrial entrepreneurs and their families. By Turkish provincial standards, Edremit is a prosperous town, and in the 1960s its economy was beginning to diversify from an earlier nearly total dependence upon olive cultivation. All the principal offices of the national government have branches there; there are numerous schools, two hospitals, political party branches, more than a dozen mosques, and an army training base. Its population, says Fallers, has a sense of well-being about it, yet its citizens are profoundly affected by and concerned about Turkey’s very real economic and political problems. Mature townsmen personally experienced the turbulent last years of empire and the first years of the republic. Middle-aged people at the time of Fallers’s work spoke of themselves as the “fatherless” generation because so many draft-age men were called up for service and never returned. The major battles of the Turkish war of independence were fought elsewhere, but the town experienced two years of enemy occupation with the ensuing consequences of demoralization, collaboration, repression, and revenge.

Kemal Ataturk intended Turkey’s war of independence to be a crisis of identity to pave the way for legitimating new forms of authority. The sultanate was abolished in 1922 and the caliphate followed in 1924: Men and women were compelled to choose between ethnic

nationalism and loyalty to the vestiges of a theocratic dynasty. Turkish Republican identity did not involve a one-time transformation; it entailed a continuing working out of commitments and personal relationships. Fallers traces these transformations in the context of Edremit so as to give concrete meaning to how the nation-state has been experienced in recent social history. In rapid succession in the 1920s, Ataturk suppressed the dervish (Sufi) orders, substituted European legal codes for Islamic personal law, decreed that the fez could no longer be worn in public (in practice it was replaced by European hats), adopted the Western calendar, decreed that Turkish was henceforth to be

[3S] Fallers, Nation-State, p. 75. The following narrative account of national identity in Turkey is based extensively upon Fallers, pp. 71-116.

written in the Latin alphabet rather than Arabic script (a move which shocked many conservative Muslims because of the association of Arabic script with the Quran), legally emancipated women and gave them access to education, established state banks and industries to stimulate economic growth, and created a new capital, Ankara. Formally, Turkey had become a secular state, although the fact that a Ministry of Religious Affairs was established indicates the continuing interest of the state in religious matters.

During the -one-party period of the 1930s and 1940s, most people participated, if not always wholeheartedly, in the new order. A cultural center was created to propagate the new Western life-style, including mixed “ballroom” dancing by the elite on formal occasions. Elite women adopted Western fashions. Islam was not suppressed, but fasting and public displays of piety fell out of style, as was indicated by Ataturk’s own ostentatiously secular funeral in 1938.

During the war years of the 1940s, the Kemalist one-party state began to lose its grip. Because of the major economic transformations engendered by the war, salaried workers and entrepreneurs became more numerous and more assertive; they and Turkish intellectuals began to demand greater freedom. From 1950 onward, with several interruptions due to military takeovers of the civilian government, Turkey can be described as a liberal, if turbulent, democracy subject to rapidly shifting forces and combinations and recombinations of power and authority.

Turkish intellectuals characterize the basic issues of politics in terms of an abstract struggle between the forces of religion and secularism. As Fallers explains, these are not disembodied forces in Turkish society; one way of grasping these forces is by seeing what they mean in practice and how they inform and shape the experience of the men and women who created them. Thus those Turks who stress their identity as Muslims adhere to an ideology that has an internal logic of its own which at times contrasts significantly with the secularist ideology of some of the Turkish elite. For such persons, the formal separation which prevails between

religion and the state in Turkish society is not easy to comprehend and even is seen to be contrary to the teachings of Islam.

The secular reformist ideology forged by Ataturk maintains its strength especially in industrial centers and among an older generation of educated Turks. For other Turks, from regions with heavy emigration to Europe, leftist ideologies also provide increasingly strong expressions of political identity. The major problem for secularists of Ataturk's generation was to provide Turks with an ideology to enable them to live civilly within their national boundaries. The major ideological problem facing Turkey today is to come to terms with the increasingly critical economic conditions and the consequent internal unrest. AsDubetsky suggests, even when leftist movements in Turkey borrow the vocabulary and policies of the European left to face these issues, in practice both the ideology and the organizational forms have been modified by prevailing regional and religious identities.[462]

In provincial centers such as Edremit even more than in the major cities, persons of different social types and ideological persuasions are too small in number to exist in closed social groups. The tensions of ideological and political differences are held in check by cross-cutting personal ties. The secular reformists have their public celebrations, such as the fiercely patriotic parades and speeches commemorating Ataturk's death. Religious officials are invited as guests, but the occasion is decidedly nonreligious. Those who emphasize Islam and traditionalism, including a growing number of youth, also have their celebrations: the public prayers on Fridays, Islamic feast days, and the fast of Ramadan.

Most Turks seek a compromise among ideological extremes. One result of the growing maturity of the Turkish republic has been a broadening of social and political choices. In the ordinary round of activities, what emerges from the experience of everyday life is a compromise and synthesis, not merely a different mixture of sociocultural elements. The compromise is not always an easy one. Turkey is neither oil-rich nor mineral-rich, and its economy has increasingly weakened, especially as opportunities for labor emigration to Europe are becoming scarcer. Political violence is not unknown on university campuses and elsewhere. Yet the fact that most Turks recognize these problems and seek to resolve them short of violence suggests the resilience and personal courage of many Turks and provides a basis for guarded optimism.

The Sultanate of Oman. The Sultanate of Oman is unique in its nearly total isolation from the outside world until 1970 and the intensity with which its oil resources have been applied to massive economic development since then. In part due to the personal idiosyncrasies of its former Sultan, Sa^cTd bin taymur (r. 1932-1970), aided by compliant British advisors and military support, Oman was almost as isolated as Tibet until a palace coup in 1970 replaced the Sultan with his son, Qabus bin Sa^cid. ■

Before 1970 the country was extremely poor in contrast to most of its neighbors, and the meager revenues derived from British subsidies went mostly for defense purposes and internal security. There were only ten kilometers of paved roads, three primary schools, and one hospital for a population estimated at 750,000. The Sultan felt that higher education only radicalized its recipients, so he allowed few Omanis with more than a primary education to return. Omanis had to tolerate such vagaries as the closing of the gates of Muscat, the capital, three hours after sundown and imprisonment if they did not carry a kerosene lantern on the streets after that time; obtaining the personal permission of the Sultan to make improvements on their houses and to purchase vehicles; and a prohibition against the wearing of Western shoes in Salala, capital of Dhufar, in the southern region of the country f° Even after oil was discovered in 1964 and began to be exported, the

[40] This section is based upon J. E. Peterson, Oman in the Twentieth Century: Political Foundations of an Emerging State (London: Croom Helm, 1978); John Townsend, Oman: The Making of the Modem State (New York: St. Martin’s Press, 1977); Fred Halliday, Arabia With- Sultan applied the revenues only in the most grudging fashion to development projects, few of which were under way at the time of his deposition.

By the late 1960s, there were over fifty thousand Omanis living and working in the various Gulf states, with more in other Arab states.[41] Many of these, including members of the Sultan’s family itself, were in self-imposed or forced exile and increasingly favored the overthrow of the old Sultan. Open rebellion gained momentum in the southern province of Dhufar in the mid-1960s and by 1968 had become radicalized. Sa^cTd bin Taymur was incapable of meeting this threat effectively, and his obdurate resistance to change or development of any kind increasingly made him an embarrassment to Great Britain. The British Foreign Office may not have directly conspired to bring about the events which led to the accession of Qabus bin Sa^cId (who had been kept isolated by his father in Salala and denied access to the palace), but a number of local British officials actively supported the 42 coup.

If most “new” nations face a major challenge in constructing “a civil politics of primordial compromise” as the only alternative to the “forcible suppression of ethnic assertion or a political Balkanization,”[43] the problems facing post-1970 Oman were particularly complex for a country of its relatively small size. Omani government spokesmen are understandably reluctant to speak of the potential lines of division in the country because they have been used in the past as a means of weakening it and to some extent by the former Sultan as a means of ensuring no challenge to his rule. Although Arabic is the principal language of communication, Persian, Baluchi, Sindi, Swahili, several Indian languages, and non-Arabic indigenous languages are known. Especially in the coastal region, many persons are bi- and trilingual. In terms of religious distinctions, there are Sunni, Shi^cT, and Ibadi Muslims and especially in the capital region a considerable number of Banian (Hindu) merchants. There is a similar ethnic and tribal diversity, with Arab, Baluchi, Indian, African, and non-Arab indigenous populations, the disappearing distinction of slave/nonslave origin, and large numbers (approximately forty-five thousand as of 1976) of “temporary” workers

from the Indian subcontinent. Additionally, many persons of Omani descent have returned from East Africa over the last decade. Because of conditions prevailing in Oman until 1970, these immigrants have tended to be better educated than native Omanis and have been given responsible posts in government and commerce.

Oman’s regional diversity also contributes to its cultural and social richness.

out Sultans (New York: Vintage Books, 1975) (his figures for Iran and the Arabian peninsula are necessarily outdated, but the study contains data difficult to obtain from other sources); and the Ministry of Information and Culture, Sultanate of Oman, “Facts about Oman” (Muscat: mimeo., 1977).

[43] Clifford Geertz, “The Integrative Revolution: Primordial Sentiments and Civil Politics in the New States,” in Old Societies and New States, ed. Clifford Geertz (New York: The Free Press, 1963), pp. 105-57.

Economically and (in the past) politically, the country faces two directions. The culturally and socially complex coastal mercantile community traditionally has faced toward the outside. Through the 1870s, this community conducted a prosperous external commerce. The Sultanate then was comprised of present-day Oman, Zanzibar, enclaves along the East African coast, and Gwadar, an island enclave off Pakistan which was sold to Pakistan in 1958 to help finance a military expedition of Sa^cid bin Taymur into Oman’s interior. [463] The country also faces inward, to the agricultural villages of the mountainous Jabal Akhdar region of “inner” Oman. Each of these villages was nearly self-sufficient economically, raising a variety of irrigated crops, sheep, and goats but politically integrated into several major tribal units, and religiously united under an IbadT Imam. In contrast to the linguistically and religiously complex coastal region, “inner” Oman’s potential divisions were primarily tribal. In addition, the southern province of Dhufar has traditionally been isolated from the rest of Oman.

In the late nineteenth century and in the twentieth century the Sultanate suffered serious economic and political decline. The British suppressed the lucrative slave trade, the Sultanate lost its East African possessions, and the coming of steamships seriously affected the key role which Omanis had earlier played in the commerce of the Indian Ocean. By 1920 the highlands had in practice become autonomous under the Ibadi Imam,

leaving Sa^cId bin Taymur dependent upon the British to administer the remainder of his realm.

The major accomplishment of Sa^cid bin Taymur’s reign was slowly to bring the entire country under his effective control. He was a master of internal politics and adroitly played tribal and other social groups against each other to preserve his own strength. In the late 1940s, he managed to obtain British support (not always willingly offered) to expand the scope of his control and to meet external threats. Because of the country’s oil potential, Saudi Arabia supported dissident movements in the Jabal Akhdar region through the mid-1950s, but Sa'Td became the first Omani Sultan in the twentieth century to bring this region under his control, a control which became increasingly tenuous as Omanis realized that it was not being used for any constructive purpose.

From 1970 to date, the challenges of open rebellion in the south and of creating a better life for all Omanis are being met. The Dhufar rebellion was effectively quelled through a combination of military force and, more importantly for the long term, through the sustained commitment of the government to use the country’s resources to improve its standard of living and to involve Omanis from all backgrounds in the country’s government and development. Several statistics suggest the scope of what has been achieved. In 1970 there were three schools in the Sultanate and 909 students, all boys. As of 1977, there were 261 schools through the secondary level and 65,000 students, boys and girls, in school. From one hospital in 1970, there were 13 by 1975, with a large number of supplementary clinics and dispensaries. From 10 kilometers of paved roads in 1970, the Sultanate possesses roughly 3,000 as of 1979. In practical terms this means that the time for trips to interior points has been greatly shortened. The trip to Nizwa, for instance, which once took two days over rough track, now takes slighty over two hours.[464]

As in all developing countries, disparities inevitably exist between regions and between the capital cities and the hinterland, but Omanis are aware of this and are seeking to mitigate them. The country was dependent upon oil exports for 90 percent of its revenues as of 1978, although the government is actively seeking ways to diversify the economy and to stem the decline of traditional agricultural activities as Omanis find more lucrative careers elsewhere.[465]

Perhaps the most important long-term indices of the country’s ability to construct a resurgent and transformed national identity are those which are most difficult to quantify. Sectarian differences within Islam have lost the divisive significance which in the past they sometimes have had. Omanis of non-Arab origin have increasingly made the conscious decision to communicate with their children at home in Arabic instead of Sindi, Baluchi, or other languages, a decision indicative of a renewed commitment to Omani national identity and to the faith placed in education as a means of social advancement. Through the late 1960s, marriages between various sectarian groups were relatively infrequent. Even groups that once had deserved reputations for not tolerating marriages

with “outsiders” now encourage intermarriage. Especially in a society in which a large part of social life is carried on within the confines of the extended family, such decisions suggest not only the consequences of recent social and economic change but also a confident self-awareness of many Omanis toward the changed basis of their cultural and social identity. Omanis are actually aware that their future is dependent only in part upon technical and economic resources—Oman’s oil reserves are estimated to be much more limited than those of some of its neighbors—and that an even more important consideration is the ability of all Omanis to continue to develop the virtues of civility which have been nurtured over the last decade.

Somalia: Scientific Socialism. Like Oman, Somalia is a small nation, 3.2 million inhabitants as of 1977, but one which traditionally has had a strong sense of ethnic and collective homogeneity. As Ioan Lewis has remarked, Somalis have traditionally tended to see social relations in terms of an expanding universe of kinship.[466] Tribalism for Somalis has traditionally meant ties of kinship and clan. The presence of ethnic Somalis beyond the borders of the present-day country has led to a certain political instability in recent years. Roughly 75 percent of all Somalis were nomadic pastoralists until the drought of the early 1970s forced the rapid sedentarization of much of the population.

In 1969 Colonel (now General) Siad Barre successfully led an officers’ revolt which resulted in the founding of the Somali Democratic Republic. Somali politics from independence in 1961 until 1969 shared much in common with other recently independent nations. A major organizational problem was integrating the former Italian and British administered zones of the country and operating modern political forms such as a parliament in a milieu in which clan identity remained paramount. Most Somalis presumed with some justification that government officials and their elected representatives acted principally along clan lines.

The revolutionary government aimed to transform Somali identity completely to bring the country into the ranks of “scientific socialism.” The use of kinship terms of address was made illegal. Homicides, which previously were regulated by conventions of clan vengeance and blood money, were firmly suppressed with the public execution of violators. The chewing of qat, a mild narcotic popular with many Somalis and Yemenis, was restricted to the hours between dusk and dawn. The government became highly centralized, with the unemployed youth organized into squads of “Victory Pioneers,” or vigilantes, to see that the government’s directives were carried out. Even the most remote towns were provided with orientation centers.

The leaders of Somalia’s revolution were obliged to create Somali terms to express the goals of the revolution. Scientific socialism was translated as “lyealth- sharing based on wisdom,” a phrase actually first used by the BBC Somali Service. Jalle, a Somali term which earlier meant “playmate” or “mate,” was used for comrade. Posters of Marx, Lenin, Kim Il-Sung of North Korea, and Siad Barre began to emerge everywhere. Kim Il-Sung was especially popular because his country managed to balance

itself with relative success between the superpowers of China and the USSR and stressed the virtue of self-reliance (juche). Even before their revolution Somalis regarded their own country as delicately poised between East and West and placed a high value upon their own autonomy.

In October 1973 Somalia adopted the Latin script; government officials were given two months to learn the new script. Somali had until then been an unwritten language, and there were stiff debates as to whether Arabic script (favored by the religiously traditional) or Latin script should be adopted. Traditionalists objected to Latin script on the grounds that it was areligious and to indicate their sentiments pronounced Latin as la din, which in Arabic means “no religion.” The strength of Siad Barre’s government allowed the reform to be effectively imposed. Later, in 1974-1975, all schools in the country were closed so that students could teach the rest of the largely illiterate population to read and write. This movement emerged as one of the world’s more successful mass literacy campaigns.

The way in which these reforms were popularly interpreted demonstrated how even “scientific socialism” had to accommodate implicitly popular notions of legitimacy and how much the revolution as practiced owed to a continuity of cultural form. The banning of kinship terms of address was intended as a break with the prerevolutionary past, although in government propaganda, the Head of State is often referred to as the father, the revolution as the mother, and the people as the issue of the two, with the orphans and unemployed, the “flowers of the revolution,” receiving particular attention of the state. M.O.D., a code name for the revolution which in Somali means hail (as in a greeting), is interpreted by many Somali as ,an acronym for the three important clans bridged by General Barre’s own kinship ties. Although the state seeks to separate itself from religious traditionalism,- it uses the imagery of Islam as locally understood to win popular support for many of its programs. General Bane allows himself to be compared with Muhammad ^cAbdille Hassan, a Somali religious leader who in the 1920s led an almost successful revolt against the British and whose kinship ties, like those of Barre, bridged Somalia’s most important clans. Scientific socialism is repeatedly claimed to be compatible with the Quran, and the Quran is regularly broadcast by Somali radio with commentaries on it being used in subtle ways to win popular acceptance of governmental reforms. Most innovations are introduced in the form of “crash” programs, most of which are labeled as jihad-s, or holy struggles.

Israel. The anthropological literature concerning Israel as a nation-state and an emerging nation is extremely rich, so that here it is possible only to indicate some of the principal approaches that have been used in its study. One of the major points of departure concerns the changing position of Arab Palestinians, both Muslim and Christian, and their class situation vis-a-vis the Jewish population. A second approach has been concerned primarily with the “ingathering of the exiles” and the forging of a Jewish/Israeli national identity in the context of immigrants with highly disparate backgrounds and skills. The first approach entails understanding the patterns of Jewish settlement in Palestine prior to the foundation of the state of Israel.[467] From 1882 to 1903, a small number of Jewish settlers arrived from eastern Europe, and the rate of arrivals increased somewhat for the period

1919-1931. By 1931, there were 175,000 Jews in Palestine, both indigenous and nonindigenous, out of a total population of 1,036,000. Jews thus constituted 17 percent of the population. The period of 1932-1939 was marked by outbursts of violence between the Jewish population on the one hand and Palestinian Christians and Muslims on the other. The British Mandate authorities sought to limit the potential for violence in part by placing immigration quotas oh Jewish settlers, but these restrictions were largely ineffective. On May 14, 1948, the Mandate was terminated and the State of Israel came into being. The population of Palestine has been estimated to be 2,065,000 as of May 1948, of which 31 percent (or 650,000) were Jews. Jews owned 6 percent of the total area and 15 percent of the cultivable land. By November 1948 in that part of Palestine which became Israel, 82 percent of the population of 873,000 was Jewish. This dramatic increase in the proportion of the Jewish population was due in part to the flight or expulsion of an estimated 650,000-700,000 Arabs and the accelerated immigration of over 100,000 Jews in the months following independence.

The new state gave priority to the problems of assimilating massive numbers of Jewish immigrants of diverse backgrounds. For this reason and for reasons of security, restrictions were placed upon the movements and labor opportunities of the Arab population. The consequences of these restrictions and their effect upon the Arab population are documented by studies such as Cohen's Arab Border Villages and Emanuel Marx's Bedouin of the Negev, the latter of which describes the economic and political life of the Bedouin during a period when Israeli military rule still applied to them.[468] Other anthropologists and political scientists have adopted the complementary perspective of studying the economic status of various groups in Israeli society and relating the class situation of the Arab and Jewish population to recent political history. Joel Migdal has linked the lack of a growth of class consciousness among Palestinian Arabs in the 1930s to the fact that no specifically urban Arab political elite had emerged. Rosenfeld has dealt with the same issue but over a longer time span which includes the thirty years since the founding of the state of Israel.[469]

Many of the studies concerning Israel as a nation-state and the politics of assimilation began as part of the Bernstein Israel Research Project, initiated at the University of Manchester in 1963 by Max Gluckman and Emrys Peters.[470] The intent of this project was to undertake comparative studies of family and kinship among Israel's different ethnic groups, to analyze varieties of leadership and local political organization, and to assess the changing relations between ethnic groups, including comparative studies of Jewish and non-Jewish communities. In practice, the resulting studies concentrated upon only a few aspects of Israel society such as cooperative rural villages (moshavim), collective settlements (kibbutzim), and the newer towns which contain higher proportions of recent immigrants.

If the first generation of these studies has concentrated upon particular communities within Israeli society, later essays have sought to interpret major trends in Israeli society on the basis of detailed prior research. One such seminal study is Deshen's "Israeli Judaism."[471] Deshen sees two major trends in the varieties of patterns of religious observance and

nonobservance among Israel’s Jews. One is the emergence of the “new” ethnic/religious category of “Oriental” Jew, formed as Jews of Middle Eastern origin have come to realize how their divergent heritages differ substantially from that of Jews of European origin. Secondly, Deshen suggests that one of the reasons that Israel’s orthodox Jews have a political significance far beyond their numbers (less than 5 percent of the population) is because of the religious basis of Israeli national identity. Although orthodox Jews have not always offered viable solutions to Israel’s major political and economic crises, no other version of Judaism has been identified as closely with the symbols of tradition and religious legitimacy. Deshen sees the continuing debate among Israelis as to the meaning of Jewish tradition as one of the keys to understanding Israeli society today.

*** Development in Perspective

The Middle East contains a range of state forms—the traditional monarchies of Morocco, Jordan, and the Arabian peninsula, democracies, such as Turkey and Israel, and one-party or military regimes in countries such as Syria, Iraq, Algeria, and the People’s Democratic Republic of Yemen. Some of these states advocate radical political doctrines; others are profoundly conservative. A major feature of all of them is a professed commitment to development, an improved life for their citizens, and either a popular participation in government or the state’s claim to speak “for the people.” Whether the states are devoid of major economic resources, such as Turkey, Jordan, and the two Yemens, or possess major oil reserves, as do Algeria and many states of the Arabian peninsula, they seek to provide services such as schools, hospitals, roads, and other community improvements within the limits of their resources. Especially as oil revenues have increased massively in recent years, the pace of development has had a profound impact upon many Middle Eastern societies. [472] In many instances the efforts to bring about economic, administrative, and in some cases political reform have led to profound social transformations of Middle Eastern political and economic life.

In seeking to understand these transformations, some anthropologists have emphasized how, despite changes in economic opportunities and patterns of political action, locally held conceptions of power and authority often suggest major continuities with those of the past. [473] Other studies of political activity, including those of Peter Gubser and Richard T. Antoun on Jordanian communities, place greatest emphasis upon the rapid economic and political change of the last thirty years.[474] Gubser, a political scientist who conducted a field study in Al-Karak, stresses the increased differentiation of townsmen in socioeconomic status, especially over the decades since the Second World War. One result of this is that an educated middle stratum of townsmen, teachers, government officials, and others has drawn away from the mass of the population and is in a position to express dissatisfaction with the traditional tribal political leaders. He documents how changing economic patterns have diminished the role of traditional leaders, how the growth of the central government and increased socioeconomic differentiation has created new cleavages between nation-state and province, although the government has sought to mitigate these cleavages through agricultural cooperatives and expanded social services. Antoun traces a similar development in his two studies, especially in Low-Key Politics. He writes that

village life, both in the past and today, has been characterized by considerable economic mobility and social differentiation. The shortage of land has acted as a constant pressure toward emigration, both in the form of military service and in wage labor elsewhere. In terms of long-term change, Antoun sees a shift in the way that day-to-day village issues are intertwined and resolved. Villagers who in the past were tied to lineage and tribal leaders now have a greater individuality and freedom to switch alliances, although their leaders enjoy no comparable flexibility. Even given these shifts, personal interrelatiopships remain so complex that with the exception of politicized schoolteachers and other persons not intimately tied to village politics, confrontations rarely involve overt challenges with the ensuing risk of total disruption of social and economic life.

A trend in virtually every Middle Eastern country has been toward more centralized state control and allocation of major resources: The consequences of investment in development are not always as intended by planners. The experience of many countries with schooling is highly significant in this respect. We have already seen how education was highly valued during the colonial era in Morocco. Relatively few persons received education and a diploma was almost a guarantee of significant employment. One of the first commitments of the independent Moroccan government was to expand the school system dramatically. In the early years after independence, students and parents in many parts of the country enthusiastically assisted in the building of schools. The Moroccan government has continued to build schools but has been unable to keep pace with the rapid population growth. Of those who can attend school and graduate—the dropout rate at all levels hovers near 90 percent—the government and the nearly stagnant private sector of the economy have been able to absorb only a few. Rapid expansion has entailed lower educational standards, so that those who can afford to do so send their children to private schools or pay for tutoring. This trend in turn encourages the poorly paid teachers to reserve their best efforts for students who can pay private tuition, a trend already prevalent for several decades in Egypt. Hence education now more than ever tends to reinforce disparities between those who can pay and those who cannot, and the initial promise of “progress” through education has abated.[475] In other countries, such as those of the Arabian Peninsula, educational facilities have been expanded only in recent years, salaries are high enough to attract competent teachers from other countries, and recent graduates are rapidly employed. In such cases, the hope placed in education as a vehicle for social change remains unshaken.

The nether side of expanded governmental services has been the expanded opportunities for corruption. In an unusual essay, John Waterbury has sought to assess systematically various patterns of corruption, using Egypt and Morocco as examples. He distinguishes three major types: endemic, planned, and developmental corruption, all of which are inherent in and exacerbated by the processes of economic development. Endemic corruption “is the abuse of public office that occurs to varying degrees in any system.”[476] When civil servants are poorly paid and there is more demand for government services than can be fulfilled, access to services often can be had only upon payment of an extralegal fee. This may be for medical attention, housing, documents such as passports and driving permits, or for the tutoring offered by teachers at all educational levels which is necessary for students to pass critical examinations. Promotions may also hinge upon payment of such

fees. Such practices are not condoned in either Egypt or Morocco, but Waterbury reports that their existence is widespread and known. So long as such exactions are kept within tolerable limits, public protest is negligible. When it reaches too high a level, resentment often takes a violent turn.

Planned corruption occurs when political leaders find it desirable to achieve a certain level of short- and medium-range control of subordinates. There are three short-term advantages to planned corruption over the distribution of rewards by objective needs or merit: The principal distributor of spoils guarantees his indispensability to the system; it undercuts the emergence of too rigorous a meritocracy, which in the case of “kings in particular, but many republican heads of state as well,” might lead to questioning the competence of the ruler. With a spoils system, rewards come from loyalty to the boss, and officials are rewarded for concentrating on their narrow self-interest. Finally, Waterbury argues that planned corruption mitigates class and social cleavages by building vertically integrated clientele through which spoils are distributed.[58] The result is to encourage a dependency and subservience toward central authorities and to dilute the ideological content of politics. Waterbury argues that this form of corruption exists both in Egypt and in Morocco but is more extensive in Morocco, where the political elite’s comparatively small size makes it easier to control. If the short-term gains are considerable for rulers, in states with limited resources such as Egypt and Morocco, the negative consequences are to squander public resources and to increase the cynicism of the elite and the masses toward governmental initiatives.

Developmental corruption occurs in situations in which the state owns or controls most of the major resources and makes most major new capital investments.[59] In the overall context of low standards of living and low literacy rates, no group except the state can play a major role. In this context there are opportunities for “brokerage” fees, noncompetitive contracts, the siphoning of foreign aid for black-market use, the evasion of currency and import regulations, and other practices which enable elements of the governmental elite and poorly paid bureaucrats at lower levels to make fortunes or at least to live more tolerably. In countries rich with oil or other resources, the consequences of such discriminatory awarding of services and favors are sometimes less damaging, but in countries where resources are meager, as in Egypt and Morocco, they reinforce “the resentment and suspicion on the part of the great mass of the poor citizenry towards the civil service and public authorities in general” and “have pernicious effects on the will of a national collectivity to work toward developmental goals.”[60]

While Waterbury’s focus is upon a prevalent yet unfortunate byproduct of development, several anthropologists have sought to evaluate the long-term implications of developmental schemes. As Nicholas S. Hopkins explains, a manifest function of development is to improve the income, the health, and the educational standards of the poor. Indirectly, development projects function to reinforce the authority of the central government and its scope of control, consequences regarded by the political elite as desirable.[61] He reviews the developmental trans-

[61] Nicholas S. Hopkins, “Development and Center-Building in the Middle East,” paper presented at the conference on “Strategies of Local Development in the Middle East,” University of Maryland, Baltimore County, September 20-23, 1978 (mimeo.). Used by permission. A discussion of this issue is also contained in the “Introduction to Part III: Agrarian Transformaformations of Egypt over the last two centuries. In the early nineteenth century, Sultan Muhammad ^cA1F Pasha introduced new agricultural techniques and the cultivation of cotton as a major cash crop. Annual basin irrigation in the Nile valley was increasingly replaced by perennial canal irrigation, and a small rural elite eventually managed to acquire control of much of the best agricultural land.

This technological and economic pattern remained relatively constant until the Egyptian revolution of 1952. One of the goals of the revolution was to maintain the technical advantages of the first agricultural transformation but to neutralize its built-in tendency toward social inequality. The size of rural landholdings was limited; large estates were broken up as part of a program of extensive land reform; and cooperatives were established in an effort to retain the economic advantages of large estates. The declared policy of the government was the mobilization of the peasantry, but despite these intentions major decisions were made by an administrative elite that often looked with disdain upon peasants and regarded them as incapable of acting in their own best interests. Nonetheless, Egyptian land reform was undertaken in earnest and had a major social impact.[62]

tion and Rural Values,” in Arab Society in Transition, eds. Saad Eddin Ibrahim and Nicholas S. Hopkins, pp- 179-82. See also Hopkins’s “Modem Agriculture and Political Centralization: A Case from Tunisia,” Human Organization, 37, no. 1 (Spring 1978), 83-87.

[62] Hopkins, “Development,” p. 8; for a critique of Western studies of Middle Eastern politics and an analysis of why many governments are reluctant to involve the bulk of the population in political discussion despite their declared commitment to political mobilization,

see R. M. Burrell, “New Questions or Old: Tradition and Modernity in the Middle East,” Encounter 39, no. 5 (July 1972), 69-73. For discussions of landownership and land reform elsewhere in the Middle East, see Nur Yalman, “On Land Disputes in Eastern Turkey,” in Islam and Its Cultural Divergence, ed. G. L. Tikku (Urbana: University of Illinois Press, 1970), pp. 180-218, and Robert A. Femea, “Land Reform and Ecology in Postrevolutionary Iraq,” Economic Development and Cultural Change, 17, no. 3 (April 1969), 356-81.

Hopkins describes a third transformation of agricultural technology which is now under way. Part of it has been engendered by the “green revolution,” new high-yield seeds and agricultural techniques, dam building, the use of computers, and intensive mechanization. The land reform of the “second transformation” created holdings too small to make mechanization pay. Effective use of the new technology requires the coordination of large numbers of peasants and the coordination of many of these holdings. Despite the effort to achieve these goals through cooperatives, the government was not wholly successful. Moreover, the expense of developing the new technology requires the central government to extract a maximum surplus from rural areas. Hopkins’s argument is essentially that the prior transformations of agricultural technology and landownership had major consequences upon social differentiation and that the present one is having equally profound, if not fully predictable, implications.

Other anthropological studies confirm the unintended consequences of economic development and planned change. David Seddon describes recent economic change in an impoverished Riffian village in northern Morocco.[477] He reports that the great majority of the active population is involved in agriculture but that only a few persons find farming sufficiently productive to live from it. Many people are compelled to emigrate in search of work, although it is increasingly hard to obtain. At the same time, farming as a way of life and wage labor in agriculturally active seasons are becoming increasingly indistinguishable. Sharecropping arrangements, which in the past provided a modicum of security for poorer families, have become rare. Labor is now treated as a commodity, and landowners find daily salaries to be a more “economic” arrangement.

Jon Anderson’s account of the introduction of tractors to tribal Afghanistan traces the social consequences of technological innovation in particular detail, especially as it has affected the relations between khans and their supporters.[478] He writes that khan in Turkic means “lord” or “chief’ of a tribe or component of it, but that in highland Afghanistan the term merely “denotes big men who are economically and politically prominent in their communities.” Khans develop leadership through patronage: gifts, favors, even regular stipends in return for support; locally, they are known for their ability to “feed their people.” Supporters are not considered employees or dependents, but as “equals” who “just miss having the wherewithal to actualize this equality in a politically meaningful way.”[479] If they were fully dependent, there would be no prestige to be gained by having them as followers. Major khans are distinguished from lesser ones by their ability to mediate disputes between tribesmen and to represent their group to those outside of it.

Beginning in 1966, tractors were introduced in the region and cultivation was markedly increased. Planners intended the tractors to be purchased collectively, but in practice they ended up in the hands of the wealthier individuals. Anderson explains that Pakhtuns favor personal autonomy and prefer not to participate in corporate ventures they cannot personally control. Moreover, the cost of tractors was too high for all but the most wealthy (which Anderson calculates in terms of 350,000 pounds of bread at retail prices or nearly twenty brides in 1973).[480] Only the wealthy purchased the machines, but rather than use the expensive technology for developing unimproved land, they not surprisingly used the tractors to bring the most immediate return. This was the cultivation of wheat on rainfall irrigated lands, which previously were regarded as a supplement to crops grown on stream-fed lands. These “supplemental” lands now were commercially plowed. Owners of tractors rented them out by the hour at a rate which was eight to ten times the going daily wage of an unskilled laborer. Tractors became strictly economic investments for “quick return and high profit” and had the consequence of diverting the investment of khans in maintaining their followings. Perennially irrigated lands of the Pakhtun require intensive labor which often is secured through sharecropping ventures among relatives and fellow community members. As economic interest has shifted to rainfall-fed lands and to crops such as wheat which require only short periods of intensive labor, long-term economic relationships such as sharecropping have declined and have been replaced by short-term migrant workers paid by the day.[481]

The social consequences of this economic shift have been dramatic. Social relations have become more strictly economic. Anderson reports that the rich tend to get richer by diverting the proceeds of their agricultural production to non- agricultural investments. Marginal landowners are unable to generate the capital needed for agricultural production and are being squeezed out, while poorer tribesmen, whose social status was traditionally ambiguous, are becoming peasants.

Like the “green revolution” elsewhere, introducing tractors into Pakhtun farming is nothing more than the spread of agribusiness with its high technology of hybrid seeds, chemical fertilizers, mechanical cultivation and commodity markets which, by dismembering an integrated enterprise, reduced labor as well to a commodity, usually the one that “costs” the least. Paradoxically, it is not a rising standard of living and greater security that is purchased by increased production but increased dependence on larger and more diversified spheres of exchange and an overall diminution of security.[482]

*** Conclusion

The emphasis which I have placed on the unplanned consequences of technological innovation and economic change implies a vision of the social sciences at marked variance with some popular conceptions of it. The French social historian Marc Bloch made the profound comment that new social forms are not usually consciously intended, but usually

occur “in the process of trying to adapt the old.”[483] There is a strain of reform and idealism which has characterized social science since the nineteenth century: an attempt to assess social forms “scientifically,” to assure social progress, and even to plan it. One theme of this book has been to stress the inadequacy of simple formulas to account for the direction and consequences of social and cultural change, and instead to seek to interpret events and their significance. Many countries in the Middle East and elsewhere face profound challenges in development, including incorporation in a world market economy, technological and organizational innovations which permit a centralization of states that would have been unimaginable in earlier epochs, and a quantum leap in the size of populations. Egypt is typical of many countries in this regard. Its population was 38.5 million in 1976, and current estimates expect this figure to double within thirty years, with no major expansion of cultivable land or of other economic resources.[484] Such challenges may be common to many countries, but each adapts to these developments and alters its direction in the light of its own history and long-established practices. The Iranian revolution of 1978-1979 serves as a poignant reminder that the direction of change cannot be “read” or predicted from general indicators and that popular notions of legitimate authority, like other fundamental .cultural values, are often much more stable and enduring than the massive technological, economic, and political transformations of recent years initially suggest and have profound consequences for the direction of change.

A second theme of this book has been to seek to compare a wide range of more specialized studies of the Middle East. The comparison of specialized studies and the particular topics and contexts which they interpret are used to sharpen our understanding of distinctive Middle Eastern cultures and societies, not to seek an illusory overall synthesis. Such comparison is used to sharpen qualitative judgments and interpretations of evidence for such general issues as the nature of legitimate authority, social inequality, conceptions of family, community, and state and how these are affected by economic and political development, the significance of transnational identities such as Muslim, Jew, and Arab, and of religious belief and practice past and present.[485] The initial questions posed must be broad enough to permit meaningful comparison, but significant interpretation involves using these concepts in such, a way as to clarify particular historical and contemporary developments. This interpretative vision of anthropology and related disciplines is necessarily complex and requires a sensitivity to particular cultural and historical details. Yet its rewards for those interested in the main issues of social thought and a greater understanding of their own and other cultures and societies are also substantial.

Two recent studies, one on Islam, the other on a small country on the Arabian Peninsula, conclude with similar images. Geertz’s Islam Observed concludes with what the author calls the “human metaphor” of a traditionally raised but French-speaking Moroccan student on an airplane bound for New York to study at an American university. It is the student’s first trip away from home, and Geertz writes that “he passes the entire trip with the Koran gripped in one hand and a glass of scotch in the other.” The second book describes an Omani who carries a dagger but adorns it with a wristwatch, who holds a camelstick in his hand but travels by Datsun, who dresses in dishdasha and skullcap but conducts business in English and spends holidays in London.[486]

Both “human metaphors” describe real comportment (although the student passing the entire trip from Morocco to New York grasping a Quran and a scotch is difficult to accept), and they are contrived to suggest strikingly contradictory and ambivalent elements of comportment. There is an element of perhaps inescapable caricature in both metaphors. I am writing the conclusion to this book in a small provincial center on the Arabian peninsula. A group of young officials has just paid me an unexpected visit. I translated the passages containing the human metaphors described above for them. They were uneasy with them, and we sought to find out why.

My friends acknowledged that the comportment described in the metaphors was probably realistic but that the choice of images was wrong because they implied a contradiction of thought and action which they found inaccurate and misleading. Our discussion led us to suggest the following description of their present situation as a more satisfactory one, although admittedly less visually striking. Intellectuals in the Middle East have often used ideological models borrowed from the West to explain developments in their countries and their aspirations. This is probably an inescapable phenomenon given world historical developments. At the same time, in the name of what the West (especially the French) calls authenticity and the Arabs call asala, Middle Easterners seek to cultivate or to revive native traditions and ideals and to achieve international recognition and respect. Middle Easterners and those of other traditions interested in comprehending Middle Eastern developments must admire the efforts, often courageous and resourceful, and at other times unavoidably hesitant and faltering, of persons and nations seeking to renew long-standing values and traditions in the exigent context of modern political and economic developments.

** Glossary

Terms are defined here according to local usages. Many terms, especially those used in religious contexts, appear in slightly different forms in each of the major languages of the Middle East; not all of these variants are given here. (P = Persian; A = Arabic; T = Turkish; H = Hebrew.) The spellings given here often reflect local usages and not the conventions of written Arabic.

Al (A): family, clan, people

^cAlawT (A), Alevi (T): Shl^ci religious sect found in Turkey, Iraq, Syria, and Lebanon

^caiim, pl. ^culama' (A): religious scholar

amTr, pl. umara' (A): prince or tribal chief

^car (Mor. A): conditional supernatural curse or compulsion

^casabTya (A): “group feeling” (Ibn Khaldun)

asala (A): authenticity

ayatullah (A and P): principal Shi^cT religious leader

^caynayn (Saudi A): “eyes,” tribal leaders

baraka (A): supernatural blessing; abundance

bayt (A): house; household

bay^ca (A): oath of fealty; homage

bin ^camm (A): father’s brother’s son (for a full listing of kinship terms, see Chapter 6, note 2)

dam (A): blood

dar (A): house; tribal territory

darb (Mor. A): quarter, neighborhood

dawra (P and A): circle; discussion group

dawwar (Mor. A): rural local community

dhikr (A): Sufi term for repetition of certain words or phrases in praise of God

dishdasha (A): a long, flowing garment, usually white for men, worn in Eastern Arabia

diya (A): blood money; recompense for bodily injury

durustliik (T): trustworthiness

fakhda (A): subdivision of a tribe; thigh

falaj, pl. aflaj (A): imgational canal, partially underground (Oman)

fqlh (cl. faqlh), pl. fuqaha' (A): a person who knows Islamic law; a Quranic teacher

ghattara (A): irrigation canal, partially underground (Morocco)

habus, pl. ahbas (North African A): religious bequest; same as waqf

hajj (A): pilgrimage to Mecca

hajj (A): a pilgrim, also the title assumed by one who has made the pilgrimage

hakim (A): ruler or judge; arbiter in pre-Islamic times

hal (A): Sufi term for mystic exaltation

hamula (A): kinship group (esp. Arabs in Israel)

haqq (A): obligation; share or right; truth

haram (A): religious sanctuary; that which is sacred or forbidden

harka (Mor. A): royal progress; movement

hijra (A): emigration; Prophet’s emigration from Mecca to Madina in 622.

hillula (Mor. A): festival for a Jewish saint

hshumlya (A): propriety; deference

^cId al-Kabir (A): the Great Feast, or Feast of Abraham

ihram (A): white seamless garment worn by pilgrims to Mecca

ijaza (A): teaching license

ijma^ca (A): concensus

^cilm, pl. ^culum (A): religious knowledge; religious scholarship

imam (A): spiritual leader; prayer leader

jahilTya (A): the pre-Islamic time of ignorance

jalle (Somali): comrade; playmate jihad (A): religious struggle or endea

vor

jinn, pl. jnun (A): a form of supernatural being

juche (Somaliborrowing fromKorean): self-reliance

Ka^cba (A): sacred enclosure at Mecca kahin (A): soothsayer khan (P): tribal leader khanqah (P): religious lodge khayma (A): tent

khuwa (A): brotherhood; tax paid for protection to a more powerful tribal group

kibbutz, pi. kibbutzim (H): collective settlement

kizb (A): lie;lying

kunya;pl. kunan (A): surname laqab; pl. alqab (A): nickname madlna, pl. mudun (A): town mahalla (Mor. A): royal encampment or progress

mahdl (A): the rightly guided one; religious leader

makruh (A): reprehensible

maktub (A): that which is written, foreordained

malaka l-hifd (A): mnemonic domination; the faculty of memory

malik, pi. muluk (A): king, sovereign mallah (A): Jewish quarter

marabout: a person, living or dead, thought to have a special relation toward God which enables him to ask for God’s grace on behalf of his clients and to communicate it to them (North Africa)

ma^crifa (A): secular knowledge

ma^cruf (A): known; used with reference to distinguished or noble families

moshav, pl. moshavim (H): agricultural colony

mudrf (Iraqi A): guest house

mujtahid (A and P): ShPT religious leader

mulk (A): royal authority; sovereignty

mullah (P): village preacher

murid (A): Sufi term for student or disciple

musha^c (A): collective landownership musim (Mor. A): a periodic festival in honor of a marabout

nafs (A): the self; the passions

nazdik (P): nearness or closeness

nisba, pl. nisab (A): name derived from occupation or origin

riiya (A): faith;intent

nizam (A): order; organization

pfr (P): Sufi master

qbila (Mor. A), gabha (Saudi A), pl. qaba'il or gaba'il: tribe

qadf, pl. quda (A): religious judge

qa'id, pl. qada (Mor. A): tribal chief appointed over a tribe or small town during the protectorate; now ^cqal (A): reason

qanat (A and P): irrigation canal, partly underground

qaraba (A): nearness or closeness

qasba (A): citadel or fortress

qat (A): mild narcotic plant, the leaves of which are chewed in Somalia, Djibouti, and the Yemen

qawm (A and P): people or nation; kinship term in Afghanistan

qudrat Allah (A): God’s will

rak^ca (A): a bending of the torso from an upright position, followed by two prostrations in Islamic prayer

Ramadan (A): lunar month of fasting

rasu l (A): messenger; envoy

ruh (A): spirit

rukn, pl. arkan (A): pillar or principle

safayi batin (P): integrity and inner purity

saj^c (A): rhymed prose

salafiya (A): Islamic reform movement

salat, pl. salawat (A): Islamic prayer ritual

SanusTya: North African religious order

sawm (A): fast

sayyid, pl. sada (Iraqi A): descendants of the Prophet

sdaq (A): bridewealth

shahada (A): declaration of faith

SharPa (A): the revealed, or canonical, law of Islam

sharTf, pl. shurafa' (A): descendant of the Prophet through his son-in-law, ^cAli, and his daughter, Fatima

shaykh, pl. shuyukh (A): tribal or religious leader

ShT^ca: major subdivision of the Islamic community

silsila (A): chain; patrilineal genealogy su ft: Islamic mystic

SunnT: major subdivision of the suq, pl. aswaq (A): market

ta^caruf (A and P): etiquette

tafsTr: sciences of interpreting the

Quran

tahrTk (Mor. A): competitive display of horsemanship

taqTya (A): concealment

tarlqa, pl. turuq (A): religious order

tasawwuf (A): mysticism; Sufism

tata (Berber): contractual ritual alliance

tawaf (A): act of circumambulating the Ka^cba

ta^czTya (A): mourning

tekke (T): religious lodge

thiqa (A): confidence

umma (A): Islamic community

wall, pl. awliya' (North African A): saint

waqf, pl. awqaf (A): pious endowment

za^cTm, pl. zu'ama' (A): leader or strongman

zawiya, pl. zawaya (A): religious lodge zawwar, pl. zawawir (Mor. A): a visitor;

a maraboutic descendant who acts as intermediary between clients and his maraboutic ancestor

zakat (A): alms tax

zerangi (P): cleverness; insincerity

[49] See P. M. Holt, The Mahdist State in the Sudan, 1881-1898 (Oxford: Clarendon Press, 1958); for discussions of the Sudanese Mahdist movement in the light of later religious developments and a broad spectrum of religious movements in Islam, see John Voll, “Islam: Its Future in the Sudan,” The Muslim World, 63, no. 4 (1973), 280-96, and his“The Sudanese Mahdi:

[4] Hodgson, Venture, pp. 60-61.

[5] Thomas S. Kuhn, The Structure of Scientific Revolutions, 2nd ed. (Chicago: University of Chicago Press, 1970).

[6] 1 prefer the neologism anormal to abnormal because the latter term implies that an established body of orthodoxy is necessary and desirable in all the sciences and an indication of disciplinary health.

[7] E. E. Evans-Pritchard, Social Anthropology and Other Essays (New York: The Free Press, 1964), p. 1.

[8] Leach first expressed this opinion in 1954 and reiterated it in Culture and Communication (New York: Cambridge University Press, 1976), p. 1.

[9] Jean Paul Sartre, Literary and Philosophic Essays (New York: Collier Books, 1962), p.

[10] Raymond Aron, Introduction to the Philosophy of History (London: Weidenfeld and Nicolson, 1961), p. 124.

[11] Raymond Aron, Main Currents in Sociological Thought, Vol. 2, trans. Richard Howard and Helen Weaver (New York: Doubleday/Anchor Books, 1970), p. 245. A similar argument, based in part upon the arguments of classic anthropological monographs, can be found in W. G. Runciman, Sociology in Its Place and Other Essays (Cambridge: Cambridge University Press, 1970), pp. 1-44.

[12] An extreme formulation of this notion which for a time blocked a more sophisticated consideration of the nature of anthropological thought can be found in A. R. Radcliffe-Brown, Structure and Function in Primitive Society (London: Cohen and West, Ltd., 1952), pp. 1-3.

[13] Marc Bloch, Feudal Society (Chicago: University of Chicago Press, 1964 [orig. 1939- 1940]); Edmund Leach, Political Systems of Highland Burma (Boston: Beacon Press, 1965 [orig. 1954]).

[14] David M. Schneider, American Kinship: A Cultural Account (Englewood Cliffs, NJ.: Prentice-Hall, Inc., 1968).

[15] The definition of institution varies significantly in the social sciences. By the term I mean customary, accepted ways of doing things in a given society. The emphasis in this definition is upon the culturally shared patterns of meaning and mutual expectations which underlie such conventions. For what I regard as the best account of the psychological aspect of the relations of the anthropologist and those cultures studied, and the consequences of this relationship for how the anthropologist conceptualizes social experience, see Vincent Crapanzano, Tuhami: Portrait of a Moroccan (Chicago and London: University of Chicago Press, 1980).

[16] Clifford Geertz, “Comments,” in Rural Politics and Social Change in the Middle East, eds. Richard Antoun and Iliya Harik (Bloomington and London: Indiana University Press, 1972), p. 460. The discussion of these issues which follows owes much to Geertz’s succinct presentation of the issues in pp. 460-67 of the Antoun and Harik volume.

[17] Geertz, ibid., p. 463.

[18] Georges Hardy, L’Ame Marocaine d’apres la Litterature Franqaise (Paris: Librairie Larose, 1926), pp. 20-67.

[19] Carleton S. Coon, Caravan: The Story of the Middle East, rev. ed. (New York: Holt, Rinehart and Winston, Inc., 1961 [orig. 1951]).

[20] Peter Beaumont, Gerald H. Blake, and J. Malcolm Wagstaff, The Middle East: A Geographical Study (New York: John Wiley & Sons, 1976), pp. 160,184-85. The limits of the Middle East as defined by Beaumont, Blake, and Wagstaff exclude all of the Maghrib except Libya, so these statistics should be regarded as approximate.

[21] These figures are derived from Donald Powell Cole, Nomads of the Nomads (Chicago: Aldine Publishing Company, 1975), p. 143, and Beaumont, Blake, and Wagstaff, The Middle East, p. 185. The tentative nature of all such overall estimates should always be kept in mind. To cite two extreme examples, population estimates for Afghanistan in 1968 ranged from 7 to 17 million. A census in Saudi Arabia in 1962-1963 (the results of which were never officially recognized) revealed the population to be only 3.9 million as opposed to earlier estimates of 7 million and a 1972 estimate of 8 million. See Beaumont, Blake, and Wagstaff, The Middle East, pp. 176-77, and Robert J. Lapham, “Population Policies in the Middle East and North Africa,” Middle East Studies Association Bulletin, 11, no. 2 (May 1977), 16:

[22] Lapham, ibid., p. 4, and Beaumont, Blake, and Wagstaff, The Middle East, p. 185.

[23] Paul Magnarella, Tradition and Change in a Turkish Town (New York: Halstead Press, 1974), p. 33. For a fuller account of Middle Eastern languages, see Gemot L. Windfuhr, “Linguistics,” in The Study of the Middle East, ed. Leonard Binder (New York: John Wiley & Sons, 1976), pp. 347-97.

[24] Robert A. Femea, “Ethnographic Essay,” in Nubians in Egypt: Peaceful People, eds. Robert A. Femea and Georg Gerster (Austin and London: University of Texas Press, 1973), pp. 15,4546.

[25] Charles Doughty, Travels in Arabia Deserta (New York: Random House, n.d. [orig. 1888]). In terms of literary style, Doughty’s Travels is probably one of the greatest nineteenth- century travel accounts, although it had little success in the author’s lifetime.

[26] Lewis, “Study of Islam,” pp. 35-36.

[27] Alan Moorehead, The Blue Nile (London: Four Square Editions, 1965), pp. 55-133, provides a well-written general account of the French occupation of Egypt.

[29] Burton, Personal Narrative, p. 5.

[30] The biographical details presented here are derived from Katharine Sim, Desert Traveller: The Life of Jean Louis Burckhardt (London: Gollancz, 1969).

[31] John Lewis Burckhardt, Arabic Proverbs; or, the Mamers and Customs of the Modem Egyptians (Totowa, N.J.: Rowman and Littlefield, 1972 [orig. 1830]); Travels in Nubia (London: J. Murray, 1822); Notes on the Bedouins and Wahabys (London: Henry Colburn and Richard Bentley, 1831). All three books are available in reprint editions. The comments concerning the implications of Burckhardt’s modes of description for his assumptions concerning Bedouin social life are derived from an unpublished paper by my student, Kenneth Sandbank, “The Relation of Literary Form to Cognitive Style in the Work of J. L. Burckhardt,” typescript, June 1979.

[32] 0ne of the best of such accounts is Henry Rosenfeld, “The Role of the Military in State Formation in Arabia,” Journal of the Royal Anthropological Institute, 95 (1965), 75-86, 174-94.

[33] Fifth edition (1860) reprinted (New York: Dover Publications, 1973).

[34] T. O. Beidelman, W. Robertson Smith and the Sociological Study of Religion (Chicago and London: University of Chicago Press, 1974), p. 29.

[35] Ibid„ p. 13.

[36] Smith wrote extensively on his trip to western Arabia. See his “Journey in the Hejaz,” in his Lectures and Essays of William Robertson Smith, ed. by J. S. Black and G. Chrystal (London: A. & C. Black, 1912), pp. 484-597. This account was first published serially in The Scotsman (February-June 1880).

[37] Smith, Lectures and Essays, pp. 491-92.

[38] William Robertson Smith, Kinship and Marriage in Early Arabia (Boston: Beacon Press, 1967 [orig. 1885]); Lectures on the Religion of the Semites (New York: Schocken. Books, 1972 [orig. 1889]). The account of Robertson Smith’s ideas is largely derived from Beidelman, Robertson Smith.

[39] W. Robertson Smith, The Prophets of Israel and Their Place in History to the Close of the Eighth Century B.C. (London: A. & C. Black, 1919 [orig. 1882]).

[40] See T. O. Beidelman’s review of the Beacon paperback edition of Kinship and Marriage, Anthropos, 63/64 (1968-1969), 592-95. Beidelman, who studied under Evans-Pritchard at Oxford, provides, the following further clarification (personal communication, April 1977): “Evans-Pritchard told me that he got his insights on segmentation from Smith and also indicated that he read Smith either before or while at Cairo [where Evans-Pritchard held a teaching post prior to his fieldwork among the Nuer], so that would suggest that the notion was in his head before fieldwork. ... He certainly had a complete and well-used set of Smith, some of which I now have.”

[41] Beidelman, W. Robertson Smith, p. 65.

[42] Smith, Kinship and Marriage, pp. 5,7,4243,269.

[43] See Talal Asad, ed., Anthropology and the Colonial Encounter (London: Ithaca Press, 1973). Asad's essay in this volume, "Two European Images of Non-European Rule," pp. 103- 18, partly concerns Snouck Hurgronje, discussed below. A more thorough study has been made of the basic assumptions of Islamic scholars, again including Snouck Hurgronje, by J. D. G. Waardenburg, L'Islam dans le Miroir de l'Occident, 3rd ed. (Paris and The Hague: Mouton & Co., 1969).

[44] One of the few exceptions I know of to this generalization is a small, neglected book by Arnold Van Gennep, better known for his The Rites of Passage (Chicago: University of Chicago Press, 1960). Van Gennep's En Algeria (Paris: Mercure de Fiance, 1914) devotes several chapters to the means by which French settlers alienated land from native Algerians and the social consequences of these and similar actions of dispossession and political subjugation.

[45] Said, Orientalism.

[46] This section is based largely upon Waardenburg, L 'Islam.

[47] The photographs were published in portfolio form in C. Snouck Hurgronje, Bilder-Atlas zu Mekka (The Hague: Martinus Nijhoff, 1888).

[48] C. Snbuck Hurgronje, Mekka in the Later Part of the Nineteenth Century, trans. J. H. Monahan (Leiden: E. J. Brill and London: Luzac & Co., 1931). This is Volume 2 of a study which originally appeared in 1888-1889. Unlike his early work in the Middle East, Snouck Hurgronje's work in the Dutch East Indies (again as ^cAbd al-Ghaffar) was directly related to the interests of Dutch colonial rule over its Muslim subjects.

[49] See, for instance, Edmond Doutte, a lecturer on Islam at the University of Algiers, "Les Morocains et la societe Marocaine," Revue Generate des Sciences, 14 (1903), 190-208, 258-74, 314-27, 372-87, and Eugene Aubin [pseud, for Eugene Descos, a French diplomatic official], Morocco of Today (London: J. M. Dent & Co., 1906; New York: Gordon Press Publishers, 1977 [orig. French, 1904]).

[50] Their investigations were published in two series of monographs, Archives Marocaines and Villes et. Tribus du Maroc, as well as in several journals. The main journals were Archives Berb'eres (1915-1920), the Revue du Monde Musulman (founded in Tangier in 1906), and after 1921,

Hesperis, which became Hesperis-Tamuda shortly after Morocco’s independence.

[51] Cited in Abdelkabir Khatibi, Bilan de la Sociologie au Maroc (Rabat: Association des Sciences de 1’Homme, 1967), p. 10. My translation.

[52] Marcel Granet, The Religion of the Chinese People, trans. Maurice Freedman (Oxford: Basil Blackwell, 1976).

[53] This literature is conveniently summarized in Douglas L. Johnson, The Nature of Nomadism, Research Paper 118 (Chicago: University of Chicago, Department of Geography, 1969).

[54] Radcliffe-Brown’s “horse” analogy is contained in his Structure and Function in Primitive Society (London: Cohen and West, 1952), pp. 184-85; Evans-Pritchard’s critique is in his Social Anthropology and Other Essays (Glencoe: Free Press, 1964), p. 181.

[55] Abner Cohen’s Arab Border Villages in Israel (Manchester: Manchester University Press, 1965) is a clear example of such an approach. For a detailed critique of Cohen’s study, see Talal Asad, “Anthropological Texts and Ideological Problems: An Analysis of Cohen on Arab Villages in Israel,” Economy and Society, 4, no. 3 (August 1975), 251-82.

[56] This is one of the elements of the argument presented in Ernest Gellner’s Saints of the Atlas (Chicago: University of Chicago Press, 1979), a complex study that will be discussed in more detail in a later chapter. See also Paul Stirling, “Cause, Knowledge and Change: Turkish Village Revisited,” in John Davis, ed., Choice and Change: Essays in Honour of Lucy Mair (New York: Humanities Press, 1974), pp. 191-229. Stirling’s original fieldwork in Turkey was conducted at intervals between 1949 and 1952 and is presented in<his monograph Turkish Village (New York: John Wiley & Sons, Inc.; 1965), now unfortunately out of print. In 1971 Stirling was allowed to return to the villages he had studied for the brief period of a week. His “Cause, Knowledge and Change,” based on this visit, recognizes the problems of studying change within the compass of a functionalist framework.

This has been reprinted in Volume 2 of Louise E. Sweet, ed., Peoples and Cultures of the Middle East (Garden City: Natural History Press, 1970), pp. 76-123. Peters’s “recantation” (my term) is contained in his “Shifts in Power in a Lebanese Village,”’ in Rural Politics and Social Change in the Middle East, eds. Richard Antoun and Hiya Harik (Bloomington and London: Indiana University Press, 1972). pp. 165-97.

[65] Peters, “Shifts in Power,” p. 165.

[1] The most significant recent studies include Fredrik Barth, Nomads of South Persia (New York: Humanities Press, 1965); Daniel G. Bates, Nomads and Farmers: A Study of the Yoriik of Southeastern Turkey, Anthropological Papers, 52 (Ann Arhor: University of Michigan Museum of Anthropology, 1973); William Irons, The Yomut Turkmen: A Study of Social Organization among a Central Asian Turkic-speaking Population, Anthropological Papers, 58 (Ann Arbor: University of Michigan Museum of Anthropology, 1975); I. M. Lewis, A Pastoral Democracy: A Study of Pastoralism and Politics among the Northern Somali of the Hom of Africa (London: Oxford University Press for the International African Institute, 1961); Emanuel Marx, Bedouin of the Negev (Manchester: Manchester University Press, 1967); Talal Asad, The Kababish Arabs: Power, Authority and Consent in a Nomadic Tribe (London: C. Hurst & Company, 1970); and a series of articles by Emrys Peters on the Bedouin of Cyrenaica (Libya), including “Some Structural Aspects of the Feud among the Camel-Herding Bedouin of Cyrenaica,” Africa, 37 (1967), 261-82, and “The Tied and the Free: An Account of a Type of Patron-Client Relationship among the Bedouin Pastoralists of Cyrenaica,” in Contributions to Mediterranean Sociology, ed. J . G. Peristiany (Paris and The Hague: Mouton & Co., 1968), pp. 167-88. The only recent monograph_on pastoralism on the Arabian peninsula is Donald Powell Cole, Nomads o f the Nomads: The Al Murrah Bedouin of the Empty Quarter, Worlds of Man (Chicago: Aldine Publishing Company, 1975). Three useful collections of recent papers are Perspectives on Nomadism, eds. William Irons and Neville Dyson-Hudson, International Studies

[67] This observation is one of the essential features of Ibn Khaldun’s reflections on tribesmen, peasants, and urban dwellers. See Ibn Khaldun (d. 1406), The Muqaddimah, 2nd ed., trans. Franz Rosenthal,, Bollingen Series, 43 (Princeton: Princeton University Press, 1967), pp. 247-310. Among contemporary anthropologists, see Talal Asad, “The Bedouin as a Military Force: Notes on Some Aspects of Power Relations between Nomads and Sedentaries in Historical Perspective,” in Desert and Sown, ed. Nelson, p. 71; and Philip Carl Salzman, “The Study of ‘Complex Society’ in the Middle East: A Review Essay,” International Journal of Middle East Studies, 9, no. 4 (November 1978), 539-57. For a major geographical study emphasizing the importance of studying regions instead of treating communities as if they were social, political, and economic isolates, see Paul Ward English, City and Village in Iran (Madison: University of Wisconsin Press, 1966).

[68] Peter Beaumont, Gerald H. Blake, and J. Malcolm Wagstaff, The Middle East: A Geographical Study (New York: John Wiley & Sons, 1976), p. 187. Cf. p. 124, where the figure is given as 1.1 percent for 1947.

[69] [s] The following account is based upon Gabriel Baer, Studies in the Social History of Modem Egypt (Chicago: University of Chicago Press, 1969), pp. 3-16.

[70] The appropriation of lands intended for collectivities by personal title was not confined to attempts to induce nomads to settle. In Syria and Palestine it was common for cultivated lands to be collectively held by villages under a system of land tenure known as musha^c. In 1858 the Ottoman administration enacted a major reform involving land registration and intended to eliminate the earlier system of tax fanning and its accompanying abuses by making cultivators directly responsible for the tax on their lands. Like many reforms, this one had unintended consequences. It provided an opportunity for unscrupulous village headmen to acquire personal title to the lands of entire villages. See Talal Asad, "'Anthropological Texts and Ideological Problems: An Analysis of Cohen on Arab Border Villages in Israel," Economy and Society, 4, no. 3 (August 1975), 261.

[71] For example, Irons, Yomut Turkmen, pp. 21-27, 61-81.

[74] For an interesting reconstruction of "traditional" raiding patterns and an explanation of how such raiding served as a means of redistributing livestock wealth, see Louise E. Sweet, "Camel Raiding of North Arabian Bedouin: A Mechanism of Ecological Adaptation," in Peoples and Cultures of the Middle East, Vol. 1, ed. Louise E. Sweet (Garden City, N.Y.: Natural History Press, 1970), pp. 265-89.

[75] Rosenfeld, "Social Composition," pp. 78-79.

[76] Asad, "The Bedouin as a Military Force," p. 62.

[77] As with many religious movements, the Wahhabi movement is known by separate names to its adherents and to outsiders. Adherents know it as "the call to the doctrine of the Oneness of God," after its claim to return to the original principles of Islam as they were in seventh-century Arabia and to eliminate later accretions to Islamic practice. Other Muslims and Westerners know the movement by the name of its founder, Ibn ^cAbd al-Wahhab (1703/4- 1792), who persuaded the ruler of a small oasis settlement (an ancestor of the present Saudi dynasty) to accept his religious teachings and to undertake a series of military raids to persuade other tribes and settlements to accept them as well. For a compact account, see George Rentz, "Wahhabism and Saudi Arabia," in

The Arabian Peninsula: Society and Politics, ed. Derek Hopwood, Studies on Modem Asia and Africa, 8 (London: George Allen and Unwin Ltd., 1972), pp. 54-66.

[78] Few anthropological studies have been made of the Arab/Persian Gulf states, but useful studies by nonanthropologists include J. B. Kelly, “A Prevalence of Furies: Tribes, Politics, and Religion in Oman and Trucial Oman,” in Arabian Peninsula, ed. Hopwood, pp. 107-41, and Frank Stoakes, “Social and Political Change in the Third World: Some Peculiarities of Oil- Producing Principalities of the Persian Gulf,” ibid,, pp. 189-215, For the role of tribes inTran, see Philip C. Salzman, “National Integration of the Tribes in Modem Iran,” Middle East Journal, 25, no. 3 (Summer 1971), 325-36.

[79] Lewis, Pastoral Democracy, pp. 266-95; also I. M. Lewis, “The Politics of the 1969 Somali Coup,” Journal of Modem African Studies, IQ, no. 3 (October 1972), 383-408.

[80] Fredrik Barth, “Nomadism in the Mountain and Plateau Areas of South West Asia,” Problems of the Arid Zone, UNESCO (1960) [Bobbs-MerriU Reprint A-263], p. 341; Beaumont, Blake, and Wagstaff, The Middle East, pp. 187,321.

[81] [1&] Ibid„ p. 187; Abdalla Said Bujra, “The Social Implications of Development Policies: A Case Study from Egypt,” in Desert and Sown, ed. Nelson, p. 156.

[82] Bates, Nomads and Farmers, p. 222.

[83] Another reason for the strengthening of traditional leadership and loyalties appears to be the large-scale involvement of the Bedouin in smuggling activities. Livestock is smuggled into Libya, where prices are much higher than in Egypt. Such practices, had to be concealed from government officials, at least at a formal level. See Bujra, “Social Implications,” p. 150.

[84] Cole, Nomads, pp. 144-63; Cole, “The Enmeshment of Nomads in Sa’udi Arabian Society: The Case of Al Murrah,” in Desert and Sown, ed. Nelson, pp. 113-28.

[85] Cole, Nomads, pp. 24,161.

[86] Ibid., p. 39.

[87] Seasons are determined by climatic conditions, not by calendar months, so their occurrence varies widely from year to year.

[88] Cole,Nomads, pp. 41-43.

[89] Dar, like many other terms relating to kinship, residence, and “tribe,” has differing meanings throughout the Arab world, so that usage in one locale and context is not necessarily a reliable guide for usage elsewhere. In other contexts in Saudi Arabia, colloquial Arabic dialects elsewhere, and in classical Arabic, dar, for example, is translated as “house.”

[90] Cole, Nomads, pp. 43-46.

[91] Ibid., p. 21;

[92] Ibid., p. 47; Fredrik Barth, “The Land Use Pattern of Migratory Tribes of South Persia,”Norsk Geografisk Tidsskrift, 17 (1959) [Bobbs-Merrfll Reprint A-ll], 1-11.

[93] Cole, Nomads, pp. 46-51.

[94] Ibid., pp. 51-52.

[95] Ibid., pp. 36-39, 69, 90. Throughout his study (for example, p. 96), Cole stresses the egalitarian ideology of the Al Murra, but as he points out on p. 90, poor lineages that are obliged to hire out as herders are considered to be inferior by birth. Such lineages frequently are considered to have as ancestors an Al Murra male and a slave woman rather than a woman of the Al Murra itself. These nuances of genealogical manipulation point to a more complicated ideology of social identity than the simple premise of equality asserted by the Al Murra.

[96] Ibid., p. 85.

[97] Ibid., pp. 85-88.

[98] Ibid., p. 86. Although Cole uses the present tense, it is likely that the statements of his informants refer to conditions in the past, before the effective emergence of Saudi government control.

[104] ^Ibid., p. 631. For an alternative account of the effects of economic processes upon social differentiation and settlement as a consequence both of wealth at one end of the economic spectrum and poverty at the other, see Barth, Nomads, pp. 101-11.

[105] My “Ideological Change and Regional Cults: Maraboutism and Ties of ‘Closeness’ in Western Morocco,” in Regional Cults, ed. Richard P. Werbner, A.S.A. Monograph 16 (New York and London: Academic Press, 1977), pp. 3-28, used the term part-ideology instead of practical ideology. Out of context, the earlier term could be taken to imply a weakness or i inferiority of such ideologies in contrast to those which are formally elaborated; the term practical ideology is less likely to be so construed.

[106] 1. M. Lewis, “Kim Il-Sung in Somalia: The End of Tribalism?" in Politics in Leadership: A Comparative Perspective, eds. William A. Shack and Percy S. Cohen (Oxford: Clarendon Press, 1979), pp. 1344.

[107] The emphasis upon the practical contexts in which social forms are used follows Pierre Bourdieu, Outline of a Theory of Practice, trans. Richard Nice, Cambridge

Studies in Social Anthropology, 16 (Cambridge and New York: Cambridge University Press, 1977), pp. 35-36.

[108] For a brief review of these usages, see Marx, “The Tribe,” 343-44.

[109] Eickelman, “Time,” pp. 50-52. The discussion of Moroccan tribal organization is further documented in Eickelman,Moroccan Islam, pp. 115-21.

[110] Marx, “The Tribe," pp. 356,359.

[111] Emile Durkheim, The Division of Labor in Society, trans. George Simpson (New York: The Free Press, 1933), p. 175.

[112] ’ [ls] Ibid„ pp. 174-81.

[113] He made , this point in speaking with Robert Femea at Oxford in the early 1960s (Robert Fernea, “Sunrise Semester,” CBS-TV, October 10, 1975). Evans-Pritchard taught in Cairo from 1932 to 1934 and made numerous trips to the Bedouin during this period. He later applied the notion of segmentation to the Bedouin of Cyrenaica, Libya, but only in a highly condensed form devoid of specific historical examples. See his The Sanusi of Cyrenaica (Oxford: The Clarendon Press, 1949).

[114] Emrys L. Peters, “Some Structural Aspects of the Feud among the Camel-Herding Bedouin of Cyrenaica," Africa, 37, no. 3 (July 1967), 261-81. Except where otherwise noted, the following account is based primarily upon Peters’s critique, For Peters's more general views on the use of segmentary lineage theory in Middle Eastern contexts, see his “Aspects of Affinity in a Lebanese Maronite Village,” in Mediterranean Family Structures, ed. J. G. Peristiany, Cambridge Studies in Social Anthropology, 13 (London: Cambridge University Press, 1976). The article has a much wider significance than Peters’s title indicates. For an excellent comparative discussion of the feud and its importance for understanding “tribal” societies in the Mediterranean, see Jacob Black-Michaud, Cohesive Force: Feud in the Mediterranean and the Middle East (New York: St. Martin’s Press, 1975). In many ways Black- Michaud’s argument develops Peters’s insights on the feud. A foreword by Peters presents a summary of his views of the subject.

[115] David Hart describes a situation in the Moroccan Rif prior to colonial rule in which feuds were so endemic that each house took the form of a pillbox in some regions. Since

[116] women were left out of feuds, special women's markets developed so that households could maintain economic contact with the outside world. Several exclusively women's markets still exist in the region. For an elaborate account of feuds in the Rif using segmentary lineage theory, see David M. Hart, "Clan, Lineage, Local Community and the Feud in a Riflan Tribe [Aith Waryaghar, Morocco]," in Peoples and Cultures of the Middle East, Volume 2: Life in the Cities, Towns, and Countryside, ed. Louise E. Sweet (Garden City, N.Y.: The Natural History Press, 1970), pp. 3-75. Another useful study by Hart which historically examines the relation of Moroccan "tribes" to the country as a whole is "The Tribe in Modern Morocco: Two Case Studies," in Arabs and Berbers: From Tribe to Nation in North Africa, eds. Ernest Gellnet and Charles Micaud (London: Duckwoith, 1972), pp. 25-58. For a description ot endemic feuding in southern Arabia prior to colonial rule in the 1930s, see H. W. Ingrams, A Report on the Soda! Economic, and Political Conditions of the Hadramaut, Colonial Office, No. 123 (Longon: H.M.S.O., 1936).

[19] For example, see Emest Gellner, Saints of the Atlas, The Nature of Human Society Series (London: Weidenfeld and Nicolson, 1969).

[117] Pierre Bourdieu, Outline, pp. 30-71, is one of the few social anthropologists besides Peters who has realized the full significance of such ties.

[118] See ibid., pp. 33-38 and the discussion in Chapter 6 of this hook concerning father's brother's daughter's marriage.

[119] 0n the Bedouin of Cyrenaica, see Peters, "Some Structural Aspects," esp. pp. 269, 280-81.

[120] Ernest Gellner, "Political and Religious Organization of the Berbers of the Central High Atlas," in Arabs and Berbers, p. 59.

[121] Detailed analysis of Gellner's use of the concept of segmentation can be found elsewhere. Black-Michaud discusses Gellner throughout his Cohesive Force, esp. pp. 269, 280-81, while I have discussed it implicitly in Moroccan Islam, pp. 105-21, and explicitly in "Ideological Change and Regional Cults," esp. pp. 23-24. A highly original and detailed critique by a Moroccan sociologist who has worked in the same region as Gellner is Abdellah Hammoudi, "Segmentarity, Social Stratification, Political Power and Sainthood: Reflections on Gellner's Theses," Economy and Society, 9, no. 3 (August 1980), 279-303. Another useful discussion of Gellner's thesis is Mildred Geertz's review of Saints of the Atlas, which appeared in the American Jouma! of Sociology, 7 6(1971),763-6 6.

[122] cates in detail how informants can have genealogical models “suggested” to them by anthropologists, see Hildred Geertz, “The Meanings of Family Ties,” pp. 349-56. Emrys Peters, “Aspects of Affinity in a Lebanese Maronite Village,” in Mediterranean Family Structures, ed. J. G. Peristiany, Cambridge Studies in Social Anthropology 13 (New York: Cambridge University Press, 1976), pp. 27-28, discusses the perils of drawing unwarranted inferences from kinship terminology alone, citing examples from contemporary anthropological literature.

[123] Edward W. Said, Orientalism (New York: Pantheon Books, 1978), p. 312. Said’s quote is from Morroe Berger, The Arab World Today (Garden City, N.Y.: Doubleday Anchor Books, 1964), p. 151.

[124] Robert Leroy Canfield, Paction and Conversion in a Plural Society: Religious Alignments in the Hindu Kush, Anthropological Papers, 50 (Ann Arbor: University of Michigan Museum of Anthropology, 1973), pp. 34-35.

[125] [s] Abner Cohen, Arab Border Villages in Israel (Manchester: Manchester University Press, 1965), pp. 2-3,105-29.

[126] Abner Cohen, “The Politics of Marriage in Changing Middle Eastern Stratification Systems,’’ in Kssays in Comparative Social Stratification, eds. Leonard Plotnicov and Arthur Tuden (Pittsburgh: University of Pittsburgh Press, 1970), pp. 195-209.

[127] See Cohen, Arab Border Villages, pp. 71-93, for his best example of historical changes in the politics of marriage alliances and the elasticity with which normative claims of marriage “rules” are interpreted. Cohen’s observations are far from isolated ones. In his study of a provincial urban center in Turkey, Peter Benedict, also reacting against prevailing assumptions of lineage theory arid the solidarity of extended families, found that even when there was a compact arrangement of the houses of married sons within a natal courtyard, “many of the households so arranged . . . had virtually nothing to do with their close agnatic neighbors.” See Peter Benedict, “Aspects of the Domestic Cycle in a Turkish Provincial Town,” in Mediterranean Family Structures^ p. 239.

[128] For a more detailed discussion of this concept and its use, see my Moroccan Islam: Tradition and Society in a Pilgrimage Center, Modem Middle East Series, 1 (Austin and London: University of Texas Press, 1976), pp. 95-105,183-210.

[129] Ibn Khaldun, The Muqaddimah, trans. Franz Rosenthal, Vol. 1, 2nd ed., Bollingen Series 43 (Princeton: Princeton University Press, 1967), pp. 249-310, esp. p. 264.

[130] This distinction is elaborated in Clifford Geertz, “On the Nature of Anthropological Understanding,” American Scientist, 63, no. 1 (January-February 1975), 47-48.

[131] The identifying numbers are keyed to Fig. 6-2.

[132] Peters, “Aspects of Affinity," p. 32, also emphasizes this point.

[133] For details of the incident, see Dale F. Eickelman, “Is There an Islamic City? The Making of a Quarter in a Moroccan Town,” International Journal of Middle East Studies, 5, no. 3 (July 1974), 289-93.

[134] See Colette Petonnet, “Espace, Distance et Dimension dans une Socidt^ musulmane: APropos du Bidonville marocain deDouar Doum a Rabat,”L’Homme, 12 (1972),47-84.

[135] Fuad I. Khuri, From Village to Suburb: Order and Change in Greater Beirut (Chicago and London: University of Chicago Press, 1975), pp. 37-62.

[136] Fuad I. Khuri, “A Profile of Family Association in Two Suburbs of Beirut,” in Mediterranean Family Structures, p. 93.

[137] Some of the basic theoretical points were published earlier in Clifford Geertz and Hildred Geertz, Kinship in Bali; nonetheless, Hildred Geertz“s Moroccan work (“Family Ties,” pp. 315-91) tends to be presented in a more extensive manner which lends itself more readily to intraregional comparison.

[138] H. Geertz, “Family Ties,” p. 333.

[139] Ibid., p, 334. Such pressures were even more intense in[!] the large households of an earlier generation of the wealthy throughout the Middle East. An Egyptian historian, Afaf Lutfi al-Sayyid Marsot, drawing upon the recollections of her family and friends, writes of her research concerning such houses: “I was given multiple examples of houses where three generations lived together and who with their servants and retainers came to well over sixty inmates- the women could not exactly remember the names of all the retainers so only accounted for the major ones.” Polygamy was also prevalent in such circles, although in Egypt at present only 0.05 percent of marriages are polygamous; See her

“The Revolutionary Gentlewomen in Egypt,” in Women in the Muslim World, eds. Lois Beck and Nikki Keddi (Cambridge and London: Harvard University Press, 1978), pp. 263, 275. As with the formal contours of any institution, it would be misleading to regard the social significance of polygamy In one-dimensional terms. Clearly, the institution favors male dominance. In the past, especially when combined with the practice of concubinage, polygamy could be used as a means of sealing political alliances. In other cases, even by contemporary sensibilities, its use could be more benign. For example, a young Moroccan religious scholar was studying at one of the country’s mosqueuniversities just after the inception of the French protectorate in 1912. He was lodged in the house of one of his teachers and took his meals there. In the early 1960s, the wife of his teacher was widowed and left with no adequate means of support. Out of respect and gratitude to both . his former teacher and his wife, the former student, now a distinguished qddr(religious judge), took the widow as his second wife. Marriage was the only available means by which he could incorporate her into his household and care for her in her later years.

[145] Vanessa Maher, Women and Property in Morocco, Cambridge Studies in Social Anthropology, 10 (Cambridge: Cambridge University Press, 1974), p. 157.

[146] Ibid„ pp. 191-220.

[147] A Moroccan informant discussing marriage practices with Hildred Geertz, cited in “Family Ties,” p. 363.

[148] For an elaboration of the similarities of Muslim and Jewish practices in many domains, see S. D. Goitein, A Mediterranean Society: The Jewish Communities of the. Arab World as Portrayed in the Documents of the Cairo Geriza. Volume III: The Family (Berkeley and Los Angeles: University of California Press, 1978). Although Goitein is principally concerned with the tenth through the thirteenth centuries, he frequently introduces comparative material from contemporary periods. For particularly useful accounts of marriage negotiations and ceremonies elsewhere in the Middle East, see Hamed Ammar, Growing Up in an Egyptian Village (London: Routledge & Kegan Paul Ltd., 1954), pp. 192-201; Paul J. Magnarella, Tradition and Change in a Turkish Town (New York: Halstead Press, 1974),,pp. 107-30; Richard T. Antoun, Arab Village: A Social Structural Study of a Transjordanian Peasant Community (Bloomington: Indiana University Press, 1972), pp. 114-53; and Ladislav Holy, Neighbours and Kinsmen: A Study of the Barti Peoples of Darfur (London: C. Hurst, 1974). For valuable older accounts of nineteenth-century marriage practices, see C. Snouck Hurgronje, Mekka in the Latter Part of the 19th Century (Leiden: E. J. Brill, 1931) pp. 83-144, and Edward William Lane, An Account of the Manners and Customs of the Modern Egyptians (New York: Dover Publications Inc., 1973 [orig. 1836],pp. 155-85.

[149] Daisy Hilse Dwyer, Images and Self-Images: Male and Female in Morocco (New York: Columbia University Press, 1978), indicates the complementary images Which Moroccan men and women hold of each other, although again Hiidred Geertz’s “The Meanings of Family Ties” provides the most circumstantial account of marriage negotiations. There are limits in many regions even today, as to how actively women participate In marriage choices. In Turkey, a country with a long tradition of legal reform favoring the equality of women with men, females in small urban centers continue to be “severely segregated” from the age of eleven onward. One Turkish scholar reports that “63 percent of the girls who live in small towns see their husband for the first time on their wedding day, while the proportion for the three large cities and the villages are 16 and 19 percent, respectively.” Fatma Mansur Cojar, “Women in Turkish Society,” in Women in the Muslim World, p. 133.

[150] Note the self-fulfilling cultural definition of reason. Since women at least traditionally have been restricted from participating fully in a wide range of public activities, it follows that in comparison with men when they do participate in such activities they do so often less effectively than do men. See Eickelman, Moroccan Islam, pp. 130-38.

[151] Lawrence Rosen, “I Divorce Thee,” Transaction, 7, no. 8 (June 1970), 35. Among the Yoriik of southeastern Turkey, one means of coping with the impossible escalation

of bridewealth is by kidnapping, usually done by preanangement with the couple involved and their

[152] trusted relatives. See Daniel G. Bates, Nomads and Parmers: A Study of the Yoruk of Southeastern Turkey, Anthropological Papers, 52 (Ann Arbor: University of Michigan Museum of Anthropology, 1973), pp. 59-86.

[156] Keyser, “The Middle Eastern Case,” 293.

[157] Khuri, “Parallel Cousin Marriage,” p. 606, points out that in any case, a man’s nephews are normatively committed to support him, so that such a marriage is “strategically” unnecessary. Khuri’s critique of alternative approaches is interesting, but his own concluding argument that such a union psychologically contributes to harmonious family relationships in that it blends roles that persons leam as children with the responsibilities they have as married adults is as single-stranded and tenuous as the other, arguments considered here.

[158] Maher, Women and Property, pp. 2, 3,222-24.

[170] Hildrcd Geertz, “The Meanings of Family Ties,” in Meaning and Order in Moroccan Society, Clifford Geertz, Hildred Geertz, and Lawrence Rosen (New York and London: Cambridge University Press, 1979), pp. 341-56.

[171] Part of the following discussion on naming is adapted from Dale F. Eickelman, “Time in a Complex Society: A Moroccan Example,” Ethnology 16, no. 1 (January 1977), 48-50. A thorough discussion of names which relates them to the notions of kinship and patronymic association is found in Geertz, “Family Ties,” pp. 341-56. This is one of the best discussions of naming available for Middle Eastern contexts. For a discussion of naming ceremonies and the effect of government-imposed civil registries on patterns of naming, see Hamed Ammar, Growing Up in an Egyptian Village (London: Routledge & Kegan Paul Ltd., 1954), pp. 91-93,97.

[172] Geertz, “Family Ties,” p. 342.

[173] Professor Abdul Hamid M. el-Zein, Temple University, persona] communication (June 1979). Ammar, Growing Up, pp. 92-93, points out that in Middle Eastern contexts where formal naming ceremonies for children do not exist (such as Palestine in the 1930s) the names of children are sometimes changed in later years from the ones initially given them. This is almost never the case when formal naming ceremonies exist, as occurs seven days after the birth of the child in Egypt and Morocco, among other Middle Eastern countries.

[180] /2>W„ 340.

[181] The two collections complement each other. The earlier of the two, Elizabeth Warnock Femea and Basima Qattan Bezirgan, eds., Middle Eastern Muslim Women Speak (Austin and London: University of Texas Press, 1977), is an anthology of writings by and about Middle Eastern Muslim women. The collection is specifically intended as a primary document. Lois Beck and Nikki Keddie, eds., Women in the Muslim

World (Cambridge and London: Harvard University Press, 1978), is more deliberately analytical. Ayad al-Qazzaz, Women in the Middle East and North Africa: An Annotated Bibliography, Modern Middle East Monographs, 2 (Austin: University of Texas Center for Middle Eastern Studies, 1977), contains useful entries. Cynthia Nelson’s “Public and Private Politics: Women hi the Middle Eastern World," American Ethnologist, 1, no. 3 (August 1974), 551-63, contains an excellent review of how the subject of women has been handled in a variety of ethnographic accounts. For an excellent survey of evidence-historical and contemporary-concerning the “informal" political leadership of women, especially in royal circles, see James A. Bill and Cari Leiden, Politics in the Middle East (Boston and Toronto: Little, Brown and Company, 1979), pp. 98-111.

[182] Unni Wikan, “Man Becomes Woman: Transsexualism in Oman as a Key to Gender Roles,” Man (N.S.), 12, no. 2 (August 1977), 304.

[183] excruciatingly painful operation and sometimes has resulted in death. See Rose Oldfield Hayes, “Female Genital Mutilation, Fertility Control, Women's Roles, and the Patrilineage in Modern Sudan: A Functional Analysis,” American Ethnologist, 2, no. 4 (November 1975), 617-33, The topic is predictably a sensitive one which especially educated Sudanese tend to approach with caution in public discussion, because of the disapproval which such practices arouse among both popular and educated circles in countries such as those of North Africa, where equivalent rites are unknown. It should be noted that such physically painful rites are not entirely confined to women. Although male circumcision occurs in most parts of the Middle East at an early age, in some parts of North Yemen circumcision occurs only between the ages of twelve and fifteen. The child is surrounded by a crowd of men and women. A knife is held to his foreskin while he recites the Muslim creed, “There is no God but God and Muhammad is his Prophet," three times. The foreskin is then cut and thrown into the crowd and then picked up by the youth, who proudly displays it. He is placed on his mother’s shoulders where he continues to show it off, then he leads a procession of dancers, brandishing a dagger. The boy is humiliated for life if he shows any signs of pain or distress. The practice is outlawed, but nonetheless see the photographs taken of one such ceremony in 1972 in Claudie Fayein, Yemen (Paris: Editions du Seuil, 1975), pp. 34-35. In general, such brutally direct rituals of social identity are beginning to disappear, in part through government action.

[184] Vieille, “Iranian Women,” p. 452.

[203] Elizabeth Femea, personal communication, 1978. Femea and Bezirgan’s translation of “Excerpts from The Umm Kulthum Nobody Knows, as Told by Umm Kulthum,” in Femea and Bezirgan, Women Speak, pp. 135-66, is a poignant account of the famous singer’s transformation from a village girl to an international celebrity.

[204] This is a difficulty with Fatima Memissi’s Beyond the Veil: Male-Female Dynamics in a Modern Muslim Society (New York: Halstead Press, 1975), which gives summaries of Robertson Smith’s speculations concerning women in pre-Islamic Arabia, the Prophet Muhammad’s treatment of women in the seventh century, a superficial analysis of the writings of a twelfthcentury mystic and scholar, al-GhazzaE, interviews with fourteen Moroccan women, and an analysis of letters written to a Moroccan radio program to construct an Islamic “ideal type” of male-female relations not clearly related to historical or regional context. Nonetheless, her book is passionately argued and poses some interesting questions.

[205] The Koran Interpreted, trans. Arthur J. Arberry (London: George Allen & Unwin, Ltd.; New York: The Macmillan Company, 1955), vol. 1, pp. 59, 105-6. (Courtesy of the publishers.)

[209] Rosen, “Negotiation of Reality,” pp. 566-68. In the interview cited by Rosen on which this discussion is based, the notion of soul (ruh) is also introduced as a key term but its significance is not developed.

[210] [SS] Ibid„ p. 567.

[211] /bid., p. 568.

[212] Ibid„ pp. 569-70. See also Daisy Hilse Dwyer, Images and Self-Images: Male and Female in Morocco (New York: Columbia University Press, 1978).

[213] Fischer, “Persian Women,” pp. 189-215.

[214] Vieille, “Iranian Women,” pp. 461-68.

[215] Ibid., p. 468.

[216] 77/e Book of the Thousand Nights and a Night, trans. Richard F. Burton (New York: The Heritage Press, 1962 [orig. 1886]), pp. 3653-819. A quotation of Burton's opinion of the Chinese conveys the flavor of his judgments: "The Chinese, as far as we know them ... are the chosen people of debauchery, and their systematic bestiality with ducks, goats, and other animals is equalled only by their pederasty" (p. 3770). Although to my knowledge he uses the term "systematic bestiality" only once, his catalogue of presumed Middle Eastern amusements is equally hyperbolic.

[217] C. Snouck Hurgronje, Mekka in the Latter Part of the 19th Century (Leiden: E. J. BriU, 1931), pp. 51,106.

[218] For a discussion of Gide's sexual "pilgrimage," see Ernest Gellner, "The Unknown Apollo of Biskra: The Social Base of Algerian Puritanism," Government and Opposition, 9 (1974), 279-82.

[219] Gavin Maxwell, People of the Reeds (New York: Harper & Row, 1957), p. 205. For a more balanced and nonexoticized treatment of the same topic in Morocco, see Maxwell's later Lords of the Atlas: The Rise and Fall of the House of Glaoua, 1893-1956 (New York: E. P. Dutton & Co., lhc., 1966), pp. 286-87.

[220] A point also argued by Keddie, "Problems in the Study of Women," p. 240. An idea of how interviewing on such delicate subjects can be successfully conducted in Middle Eastern conditions is provided by the frank discussions of sexuality contained in Paul Pascon's and Mekki Bentahar's "Ce Que Disent 296 Jeunes Ruraux," in Etudes Sociologiques sur le Maroc, ed. A. Khatibi (Rabat: Bulletin Economique et Social du Maroc, 1971), pp. 147-48 and pp. 211-21, in which the basic technique was collective interviewing.

[221] Abdelwahab Bouhdiba, La Sexualite eh Islam, Sociologie d'Aujourd'hui (Paris: Presses Universitaires de France, 1975), pp. 127-28. His text is one of the few that includes brief but interesting accounts of concubinage, prostitution, and homosexuality, and references to these topics in medieval Arabic literature.

Ernest Gellner and Charles Micaud (London: Duckworth, 1972), pp. 155-73; and also his “Muslim-Jewish Relations in a Moroccan City,” International Journal of Middle East Studies, 3, no. 4 (October 1972), 435-49. For a review of earlier anthropological approaches to the study of North African Jewish communities, see also Rosen’s “North African Jewish Studies,” Judaism - 17, no. 4 (Fall 1968), 422-29. For a critique of Rosen’s position concerning Muslim-Jewish relations, see Norman A. Stillman, “The Moroccah Jewish Experience: A Revisionist View,” The Jerusalem Quarterly, no. 9 (Fall 1978), 111-23. See also Mark A. Tessier, “The Identity of Religious Minorities in Non-secular States: Jews in Tunisia and Morocco and Arabs in Israel,” Comparative Studies in Society and History, 20, no. 3 (July 1978), 359-73; and Norman A. Stillman’s excellent The Jews of Arab Lands-A History and Source Book (Philadelphia: The Jewish Publication Society of America, 1979).

[241] On the shaping of these French colonial assumptions and their impact upon Moroccan society, see Edmund Burke Ill’s excellent “The Image of the Moroccan State in French Ethnological Literature: A New Look at the Origin of Lyautey’s Berber Policy,” in Gellner and Micaud, Arabs and Berbers, pp. 175-99; Kenneth Brown’s “The Impact of the Dahir Berbere in Sale'” in the same volume, pp. 201-15; and Charles F. Gallagher, “Language and Identity,” in State and Society in Independent North Africa, ed. Leon Carl Brown (Washington: The Middle East Institute, 1966), pp. 73-96.

[242] Lawrence Rosen provides the following estimates as of the late 1960s for the Jewish populations of various Arab countries, together with the estimates (in parentheses) of the 1948 populations. “Morocco: 45,000 (225,000); Tunisia: 12,000-14,000 (100,000); Lebanon: 4,000; Syria: 2,5004,000 (30,000); Iraq: 3,500 (130,000); Algeria: 2,000 (140,000); Egypt: 1,000 (80,000); Yemen: 1,000 (70,000); Libya: nil (35,000). Rosen; “Muslim-Jewish Relations,” p. 436, where the sources of these estimates are cited. For Iran, Laurence D. Loeb, Outcast: Jewish Life in Southern Iran, Library of Anthropology (New York: Gordon and Breach, 1977), p. 4, provides the contemporary estimate of 85,000, most of whom reside in Tehran. Figures for the late 1970s, if available, would indicate a smaller Jewish community in most cases. For example, Morocco’s Jewish population is now estimated to be 25,000.

[243] See Dale F. Eickelman, Moroccan Islam: Tradition and Society in a Pilgrimage. Center, Modem Middle East Series, 1 (Austin and London: University of Texas Press, 1976), pp. 45-48, 78.

For a review of earlier studies, see Fouad M. Moughrabi, “The Arabic Basic Personality: A Critical Survey of the Literature,” International Journal of Middle East Studies, 9, no. 1 (February 1978), 99-112.

[263] An example of such a guide is Louis Brunot, Premiers Conseils [First Advice] (Rabat: Ecole du Livre, 1934). Brunot was director of Muslim education in Morocco in the early 1930s.

[264] See the discussion in Chapter 3 of this book, especially the critique of Carleton S. Coon, Caravan: The Story of the Middle East, rev. ed. (New York: Holt, Rinehart and Winston, 1961).

[265] Lloyd A. Fallers, The Social Anthropology of the Nation-State (Chicago: Aldine Publishing Company, 1974), p. 8.

[266] The notion of the “natural” attitude toward the social world is developed in Alfred Schutz, Collected Papers, I: The Problem of Social Reality (The Hague: Martinus Nijhoff, 1967), and in Clifford Geertz, The Interpretation of Cultures (New York: Basic Books, Inc., 1973).

[267] Monographs or book-length essays elaborating such notions include Clifford Geertz, Islam Observed (New Haven and London: Yale University Press, 1968); Clifford Geertz, Hildred Geertz, and Lawrence Rosen, Meaning and Order in Moroccan Society: Three Essays in Cultural Analysis (New York: Cambridge University Press, 1979); Dale F. Eickelman, Moroccan Islam: Tradition and Society in a Pilgrimage Center, Modern Middle East Series, 1 (Austin and London: University of Texas Press, 1976); Paul Rabinow, Symbolic Domination: Cultural Form and Historical Change in Morocco (Chicago and London: The University of Chicago Press, 1975); John Waterbury, North for the Trade: The Life and Times of a Berber Merchant

(Berkeley and Los Angeles: University of California Press, 1972); and Kenneth L. Brown, People of Sale: Tradition and Change in a Moroccan City, 1830-1930 (Cambridge, Mass.: Harvard University Press, 1976).

[268] This formulation is derived from a fuller discussion of the notion in my Moroccan Islam, p. 90, which contains references to the related work of other scholars.

[269] I specify implicit because a number of Moroccan intellectuals write of their own society in terms of the principles of class analysis. For a discussion of the limitations of an uncritical borrowing of the notion of class from European ideological contexts, see A. R. Dubetsky (Duben), “Class and Community in Urban Turkey,” in Commoners, Climbers and Notables, ed. C. A. O. van Nieuwenhuijze (Leiden: E. J. Brill, 1977), pp. 360-71.

[270] The discussion of these notions is adapted from Eickelman,Moroccan Islam, pp. 123- 54. (Courtesy of the author and the publisher.)

[271] Toshihiko Izutsu, God and Man in the Koran (Tokyo: Keio Institute of Cultural and Linguistic Studies, 1964); and James Siegal, The Rope of God (Berkeley and Los Angeles: University of California Press, 1969).

[272] Cited in Eickelman, Moroccan Islam, p. 128.

[273] Ibid„ p. 133.

[344] Geertz, Islam Observed, p. 24.

[345] See Eickelman, Moroccan Islam; Brown, People of Sale.

[346] The best account of the development of Sufi thought is probably Hodgson, Venture, I, 359409; II, 201-54.

[347] Hodgson, Venture, II, 201-54.

[348] Such assumptions of a “decline” as Sufi ideas became popularly received unfortunately permeates most of the Orientalist literature on the subject. See A. J. Arberry, Sufism: An Account of the Mystics of Islam (London: George Allen & Unwin Ltd., 1950); W. Montgomery Watt, Muslim Intellectual: A Study of Al-Ghazzali (Edinburgh: University Press, 1963), esp. pp. 128-33; Rahman, Islam. On this

point, see also the analysis of the classic study by the French Orientalist Alfred Bel contained in Eickelman, Moroccan Islam, pp. 22-29.

[349] Jamil M. Abun-Nasr, The Tijaniya: A Sufi Order in the Modem World, Middle Eastern Monographs, 7 (London: Royal Institute of International Affairs, 1965).

[350] See Vincent Crapanzano, The Hamadsha.

[351] See the map in Octave Depont and Xavier Coppolani, Les Confreries religieuses musulmanes (Algiers: A. Jourdan, 1897), for the most sinister representation of the influence of these orders. The authors were French government specialists on native affairs in Algeria.

[352] Turner, Weber and Islam, pp. 57-62, 66.

[353] Frontier Fundamentalist," International Journal of Middle East Studies 10, no. 2 (May 1979), 145-66. For an account of an Algerian religious figure that is excellent in portraying doctrine, but less so in describing the nature of the shaykh's popularity, see Martin Lings, A Moslem Saint of the Twentieth Century (London: George Allen & Unwin Ltd., 1961). A useful study with comparative materials is B. G. Martin, Muslim Brotherhoods in Nineteenth-Century Africa, African Studies Series, 18 (Cambridge: Cambridge University Press, 1976).

[354] Gilsenan, Saint and Sufi.

[355] Ibid., pp. 150-51.

[356] Cited in Eickelman, Moroccan Islam, pp. 161-62. This study contains a more extensive discussion of maraboutism as an element of popular Islamic thought. (Courtesy of the author and publisher.)

[357] For an example of such a myth, see ibid., pp. 163-68. An analysis of that particular text in the wider context of the relation between oral narratives and Middle Eastern social forms can be found in Michael E. Meeker, Literature and Violence in North Arabia, Cambridge Studies in Cultural Systems, 3 (New York: Cambridge University Press, 1979), pp. 214-44.

[358] The primary literature on these practices is prindpally in French. See Pierre Flamand, Un Mellah en Pays berb'ere: Demnate, Institut des Hautes-Etudes Marocaines, Notes et Documents, 10 (Paris: Librairie Generale de Droit et de Jurisprudence, 1952), pp. 93-122; J. Goulven, Les Mellahs de Rabat-Sale (Paris: Librairie Orientaliste Paul Geuthner, 1927), pp. 91- 98; and L. Voinot, Pelerinages Judeo-musulmans du Maroc (Paris: Editions Larose, 1948). For Israel, see Shlomo Deshen and Moshe Shokeid, The Predicament of Homecoming (Ithaca: Cornell University Press, 1974), esp. pp. 100-105.

[359] The most comprehensive and elegant case for the opposite point of view is Ernest Gellner’s Saints of the Atlas, The Nature of Human Society Series (Chicago: University of Chicago Press, 1969). See the discussion of Gellner’s argument in Chapter 5 of this book. The argument concerning the tendency of marabouts to benefit from alliances with royal authority is most extensively documented in Abdellah Hammoudi, “Saintete, Pouvoir et Societe: Tamgrout au XVIIe etXVIIIe Sizcles" Annales E.S.C. (in press).

[360] Abdellah Hammoudi, “Aspects de la mobilisation populaire a la campagne, vus a travers la biographie d’un mahdi mort en 1919,” Centre de Recherches et d’Etudes sur les Societes Mediterraneenes, CNRS (in press).

[361] E. E. Evans-Pritchard, The Sanusiya of Cyrenaica (Oxford: Clarendon Press, 1949).

[362] Ibid., pp. 104-5. See also Peters’s analysis of the social structure of the Bedouin of Cyrenaica, discussed (with references) in Chapter 5, and his “From Particularism to Universalism, or the Religion of the Cyrenaica Bedouin,” Bulletin of the British Society for Middle Eastern Studies, 3, no. 1 (1976), 5-14. For a rich Mauritanian study parallel to Evan- Pritchard’s, see C. C. Stewart (with E. K. Stewart), Islam and Social Order in Mauritania, Oxford Studies in African Affairs (Oxford: Clarendon Press, 1973). For a study which has the advantage of discussing the contemporary influence of a religious order in a situation where such orders have substantial political and economic influence, see Donald B. Cruise O’Brien, The Mourides of Senegal (Oxford: Clarendon Press, 1971), and his Saints and Politicians: Essays in the Organisation of a Senegalese Peasant Society, African Studies Series, 15 (London: Cambridge University Press, 1975).

[363] Lewis has three major studies relevant to the role of Islam in Somalia. See I. M. Lewis, “Sufism in Somaliland: A Study in Tribal Islam,” Bulletin of the School of Oriental and African Studies, 17, no. 3 (1955), 581-602, and 18, no. 1 (1956), 146-60; I. M. Lewis, A Pastoral Democracy (London: Oxford University Press, 1961), esp. pp. 196-241, and his “Shaikhs and Warriors in Somaliland,” in African Systems of

Thought, eds. G. Dieterlen and Meyer Fortes (London: Oxford University Press, 1965), pp. 204-223. Another study of Islamic religious leadership in a tribal milieu is Fredrik Barth, Political Leadership among Swat Pathans, L.S.E. Monographs on Social Anthropology, 19 (London: The Athlone Press, 1959), esp. pp. 92-103. Extensive critiques of Barth's presentation can be found in Talal Asad, "Market Model, Class Structure and Consent: A Reconsideration of Swat Political Organisation," Man (N.S.), 7, no. 1 (March 1972), 74-94, and Akbar S. Ahmed, Millennium and Charisma among the Pathans, International Library in Anthropology (London: Routledge & Kegan Paul, 1976). Despite the title of J. C Wilkinson's Water and Tribal Settlement in South-East Arabia, Oxford Research Studies in Geography (Oxford: Clarendon Press, 1977), it is ah excellent resource for documenting the relation of the Ibadi religious establishment and popular notions of legitimacy to tribal social structure.

[364] Part of the discussion in this section is based upon Dale F. Eickelman, "The Art of Memory." The quotation defining cognitive style is from Pierre Bourdieu, "Systems of Education and Systems of Thought," International Social Science Journal, 19 (1967), 343.

[365] One of the few essays concerning the Muslim Middle East that deals extensively with the relation of language and artistic expression to society is Jacque Berque's Cultural Expression in Arab Society Today, Modern Middle East Series, 3 (Austin and London: University of Texas Press, 1978). Meeker's Literature and Violence is also a seminal study. Even when some modem forms of musical and graphic expression have sought to break away from more traditional art forms, they must generally do so on the basis of popular understandings of creative form, at least if their creators seek a wide audience. The major work on Arabic music (with four volumes of translations of Arabic treatises and two volumes devoted to contemporary modal, rhythmic, and formal structures) is Baron Rudolphe d'Erlanger's six-volume La Musique Arabe (Paris: Librairie Orientaliste Paul Geuthner, 1930-1959). For useful monographs and articles on the subject, see Hiromi L. Sakata, "The Concept of Musician in Three Persian-speaking Areas of Afghanistan," PhJ). Dissertation submitted to the University of Washington, in 1976; Philip D. Schuyler, "A Repertory of Ideas: The Music of the Rwais, Berber Professional Musicians from Southwestern Morocco,". Ph.D. Dissertation submitted to the University of Washington, in 1979, and his "Berber Professional Musicians in Performance," in Performance Practice: The Ethnomusicological View, ed. Gerard Behague (New York: New York University Press, 1980); Karl L. Signed, Makam: Modal Practices in Turkish Art Music (Seattle: Asian Music Publications [Series D., no. 4], 1977); Mark Slobin, Music in the Culture of Northern Afghanistan, Viking Fund Publications in Anthropology, 54 (Tucson: University of Arizona Press, 1976); and Ella Zonis, Classical Persian Music: An Introduction (Cambridge: Harvard University Press, 1973). The forms used in the traditional crafts of carpet-wearing, embroidery, woodcarving, and architecture show similar influences, although with the exception of Berque's and a few other interpretive essays, most literature on crafts and music remains highly descriptive. The transmission of many such crafts-and music is considered a craft as opposed to an art in many parts of the Middle East-has important parallels with the form in which religious knowledge was traditionally transmitted.

[366] Hodgson, Venture of Islam, H, p. 438. (Emphasis added.)

[367] The phrase is from Leon Carl Brown, “The Religious Establishment in Husainid Tunisia,” in Scholars, Saints, and Sufis, ed. Nikki R. Keddie (Berkeley and Los Angeles: University of California Press, 1972), p. 31. For a similar view expressed by an Egyptian writer (who later studied in France and became Minister of Education), see Taha Hussein, The Stream of Days, trans. Hilary Waymont (London: Longman, Green and Co., 1948). This book has been used as a required text in Egyptian primary schools, so it can be assumed that its implicit views concerning religious education have been widely disseminated.

[368] See Clifford Geertz, “Art as a Cultural System,” Modern Language Notes, 91 (1976), 1473-99, and John Paul Mason, “Structural Congruities in the Arab Genealogical Form and the Arabesque Motif,” Muslim World, 64, no. 1 (1975), 21-38.

[369] Sources for these figures are provided in Eickelman, “The Art of Memory,” 497.

[370] Albert Hourani, “Ottoman Reform and the Politics of Notables,” in The Beginnings of Modernization in the Middle East: The Nineteenth Century, eds. William R. Polk and Richard L. Chambers (Chicago and London: University of Chicago Press, 1968), pp. 41-68.

[371] Some of the outstanding studies now available are Leon Carl Brown, “The Religious Establishment”; Kenneth L. Brown, “Profile of a Nineteenth-Century Moroccan Scholar,” in Scholars, Saints, and Sufis, ed. Keddie, pp. 127-48, and his People of Sale, pp. 66-99; Edmund Burke, III, “The Moroccan Ulama, 1860-1912: An Introduction,” in Scholars, Saints, and Sufis, pp. 93-125, and his Prelude to Protectorate in Morocco, Studies in Imperialism (Chicago and London: University of Chicago Press, 1976). For medieval Iran, see Richard Bulliet, The Patricians of Nishapur (Cambridge: Harvard University Press, 1972) for which the review by Roy P. Mottahedeh in the Journal of the American Oriental Society, 95 (1975), 491-95, provides an interesting critique. For Tunisia, see Arnold H. Green, The Tunisian Ulama, 1873- 1915: Social Structure and Response to Ideological Currents (Leiden: E. J. Brill, 1978).

[399] Three outstanding collections of essays have appeared in recent years which effectively serve as guides to the major research. A. H. Hourani and S. M. Stern, eds., The Islamic City, Papers on Islamic History, 1 (Oxford: Bruno Cassirer, and Philadelphia: The University of Pennsylvania Press, 1970), concentrates on research concerning the premodem period. Ira M. Lapidus, ed., Middle Eastern Studies (Berkeley and Los Angeles: University of California Press, 1969), is now dated by more recent studies by the editor and several of the contributors. L. Carl Brown, ed., From Madina to Metropolis, Princeton Studies on the Near East (Princeton: The Darwin Press, 1973), is an excellent collection of copiously illustrated essays. Robert McC. Adams, The Evolution of Urban Society (Chicago: Aldine Publishing Company, 1966), comparatively assesses the beginnings of urbanization in early Mesopotamia and Mexico. Michael Bonine has prepared two comprehensive review essays on Middle Eastern urbanization. These are "Urban Studies in the Middle East," Middle East Studies Association Bulletin, 10, no. 3 (October 1976), 1-37, and "From Uruk to Casablanca: Perspectives on the Urban Experience of the Middle East," Journal of Urban History, 3, no 2 (February 1977), 141-80. An essential analytic review of approaches to the study of urban phenomena is Paul Wheatley, "Levels of Space Awareness in the Traditional Islamic City," Ekistics, 42, no. 253 (December 1976), 354-66. For a review of "community studies" in general, not specifically confined to urban milieu, see Erik Cohen, "Recent Anthropological Studies of Middle Eastern Communities and Ethnic Groups," Annuid Review of Anthropology, 6 (1977), 315-47.

[443] Ibid„ p. 162.

[444] "ibid., p. 163.

[445] The newspaper al-Muharrir (Casablanca), August 16, 1979, describes the reception of

[446] tribal delegations totaling three hundred men and sixty women from the Sahara’s Wadi Dhahb region to renew their oath of allegiance to the Moroccan throne. The ceremony involved the

[447] sacrifice of sheep and bulls. In the colonial era, similar sacrifices were offered to the French to

[448] signify the cessation of hostilities.

[449] Emest Gellner and Charles Micaud, eds., Arabs and Berbers: From Tribe to Nation in North Africa (London: Duckworth; Lexington, Mass.: D. C. Heath and Company, 1972).

[450] Robert Montagne, in his foreword to Georges Drague [Spillman], Esquisse d'Histoire religieuse du Maroc (Paris: J. Peyronnet, 1951). (My translation.) Montagne was one of colonial Morocco's outstanding sociologists. For a translation of one of his key works in English, with an excellent introduction by David Seddon, see Robert Montagne, The Berbers: Their Social and Political Organization (London: Frank Cass Co., 1973).

[451] E. E. Evans-Pritchard, The Sanusi of Cyrenaica (Oxford: Clarendon Press, 1949), pp. 90-229.

[452] Rene Maunier, The Sociology of Colonies, trans. E. O. Lorimer (London: Routledge & Kegan Paul, 1949), Vol. I, p. 19. This remains one of the best available accounts of "colonial sociology" and in some ways is all the more valuable for its "insider" perspective.

[453] 0ne of the best accounts of the varieties of North African colonial experience is Jacques Berque's masterly, French North Africa: The Maghrib Between Two World Wars (New York: Frederick A. Praeger, 1967). Berque's method is essentially to paint vivid word pictures of tribes, towns, persons, events,' and the attitudes of those who experienced them. A more analytical account of comparative colonial rule in North Africa and its impact upon different forms of independent government is Elbaki Hermassi, Leadership and National Development in North Africa (Berkeley and Los Angeles: University of California Press, 1972). See also Abdelkader Zghal's excellent "Nation-building in the Maghreb," International Social Science Journal, 23, no. 3 (1971), 435-51.

[454] On Algeria, in addition to Berque's French North Africa; a good point of departure is Pierre Bourdieu's The Algerians (Boston: Beacon Press, 1962). This study was written at the height of the Algerian conflict and should be complemented by his

later Algeria 1960, Studies in Modern Capitalism (New York: Cambridge University Press, 1979).

[455] Edmund Burke III, “Fez, the Setting Sun of Islam: A Study of the Politics of Colonial Ethnography,” The Maghreb Review, 2, no. 4 (July-August 1977), 1. See also Burke’s excellent Prelude to Protectorate in Morocco: Precolonial Protest and Resistance, 1860-1912, Studies in Imperialism (Chicago and London: University of Chicago Press, 1976).

[456] A now-standard French source on this early period and on the Riffian war of the 1920s is Germain Ay ache, Etudes d’fflstoire marocaine (Rabat: Societe Marocaine des Editeurs Reunis, 1979); see also Abdallah Laroui, Les Origines sociales et culturelles du Nationalism marocain (1830-1912) (Paris: Librairie Francois Maspero, 1977). For a sensitive account of French penetration of Morocco’s southeast, see Ross E. Dunn, Resistance in the Desert: Moroccan Responses to French Imperialism, 1881-1912 (Madison: University of Wisconsin Press; London: Croom Helm, Ltd., 1977).

[457] A sort of colonial vulgate describing the French administrative machinery from the perspective of a former member of the British Colonial Service in West Aden Protectorate is Robin Bidwell’s Morocco Under Colonial Rule: French Administration of Tribal Areas, 1912- 1956 (London: Frank Cass, 1973).

[458] For accounts of the impact of colonial penetration in various locales, see Dunn, Resistance; Dale F. Eickelman; Moroccan Islam: Tradition and Society in a Pilgrimage Center, Modern Middle East Series, 1 (Austin and London: University of Texas Press, 1976), pp. 211- 54; and (for the ex-Spanish zone) David Montgomery Hart, The Aith SVaryaghar of the Moroccan Rif, Viking Fund Publications in Anthropology, 55 (Tucson: University of Arizona Press, 1976). Amal Rassam Vinogradov, The Ait Ndhir of Morocco: A Study of the Social Transformation of a Berber Tribe, Anthropological Papers, 55 (Ann Arbor: University of Michigan Museum of Anthropology, 1974), pp. 79-105, is particularly good in describing the

[459] On education, see John Damis, “Early Moroccan Reactions to the French Protectorate: The Cultural Dimension,” Humaniora Islamica, 1 (1973), 15-31. The cited figures are from Ladislav Cerych, Europeens et Marocains, 1930-1956: Sociologie d’une Decolonisation (Bruges: De Tempel, 1964), p. 297; and Waterbury, Commander, p. 84.

** Foreword

by Clifford Geertz

It used to be that people called ethnographers asked questions and people called informants answered the questions, which the ethnographers duly recorded and worked into monographs, but things don't work that way anymore. It is not merely that the subjects of ethnographical study are increasingly unwilling to submit to so one-sided an exchange, one which reduces them to walking-around archives from which data are to be extracted; ethnographers have a clearer understanding of what it is they must do if they are to comprehend people different from themselves—start a conversation and maintain one. It is dialogue that does it, however delicate and liable to misfire, not inquisition, however orderly and straight from the shoulder.

But if Notes and Queries anthropology is dead or dying, along with the "we are the knowers, you are the known" cultural confidence that generated it, it is not always possible to discern the fact from anthropological writings which are still most commonly presented as summary reports of distant discoveries: rocks from the moon. There have been some scattered attempts to make the dialogical nature of contemporary ethnographic research more apparent to the world at large, but they have largely consisted in informal prefaces, personal confessions, or word-literal reproductions of particular interchanges, all of which more evoke the fact than put it to analytical use. There have been only a very few studies in which the anthropological conversation has been used to reshape the way in which material is presented and its implications explored. It is to this select company that Dr. Eickelman's work belongs. Setting the relation between himself, an intrusive American intellectual, and Qadi Hajj Abd ar-Rahman Mansuri, a rooted Moroccan one, at the very center of his narrative, he has altered the form of a scholarly genre.

He has also extended its reach. His attempt to write a "social biography"—an account of his struggle to describe a traditional Islamic educational system and that of a rural judge to make his way through that system, set against the background of their momentarily converging lives—makes it possible for Eickelman to approach some typical anthropological issues in a quite untypical way. It is not just local color that this "The Judge and I" approach to things provides (though it does that too), nor but a backstage view of how an ethnographer works (though such a view is usefully demystifying). It provides an unusual angle from which to view an old and powerful cultural institution—an angle rather close to that from which its champions, or its prisoners, themselves view it.

The sense of what description and explanation amount to in anthropology that emerges from Eickelman's pages is thus a quite distinctive one. It is not at all usual to find in a work such as this extended discussions of the pursuit of a cache of disintegrating manuscripts through a labyrinth of factional jealousy, proprietary claims, family secrecy, and cultural suspicion. Even less, does one expect to encounter images of a young fieldworker and an indigenous scholar, thirty years his senior, bent over such manuscripts, admiring calligraphy, hunting

for traces of economic dependencies, reading between the lines of political gossip, and discoursing on caravans and dress codes. And, perhaps least of all, is it common to come upon vignette narratives of such an odd couple working together, like a good cop and a bad cop, to worm the true story of a tribal massacre out of a peasant intruder at a landlord luncheon. An Eickelman explicitly remarks, what we have here is not a Berber judge "speaking for himself" (something he does quite well in his own ways, with his own means, and to his own ends), nor an American anthropologist speaking for him (something he is in no position, morally or inteilectually, to do). What we have is a mixture of these unlike and jostling voices inscribed in a text: a "social document" in which they can be heard happily discoursing.

It is out of this discoursing that the substantive contributions of Eickelman's study come. The very figure of the qadi, reflective, questioning, shrewd, and knowledgeable in everything from linguistics to jurisprudence, undercuts the "wild west" image of Morocco (horses, guns, and wild-eyed holy men), and the story of his career, mosque school to Muslim university, demolishes the notion (one not only foreigners share, but many "evolue" Moroccans as well) that Islamic education was decadent there at its birth and declined thereafter. A simple opposition of an oral tradition and a written one, the first mindless and habitual, the second self-conscious and critical, can hardly survive a man who first reduces texts to memory—the Quran, a rhymed grammar, a legal handbook—and then starts to employ Arabic as a spoken language. (I once asked a Moroccan oral poet how he acquired his skill. "I memorized the Quran," he said; "Then I forgot the sentences and remembered the words.") The picture of the qadi and his brother's constant movement back and forth between a Muslim Podunk like Bzu or Boujad and a Muslim Paris like Marrakesh similarly dissolves any very sharp distinction between "great" and "little" traditions, "normative" and "folk" Islam, or urban cosmopolitanism and rural provincialism. 'Abd ar-Rahman escapes a lot of categories.

But it is not from his side only that enlightenment comes. Dr. Eickelman's role in the conversation is hardly passive; he is no I-am-a-recorder anthropologist registering what he sees and hears and passing it on uninterfered with. The formulation of "Islamic knowledge" in Morocco as a matter of "mnemonic possession," the connection of such a notion to the means by which such knowledge is developed and transmitted, and the observation that elsewhere in the Islamic world—Oman, Iran—other notions lead to other means define 'Abd ar-Rahman's style of thought in a way he is unlikely to be able to do himself, or, indeed, concerned with more instant matters, to have much interest in doing.

So do the careful tracing of the interplay between scholastic and brotherhood currents within Moroccan Islam, of the origins and nature of "reformism" within it, of its vicissitudes in the nationalist period, and of its present state and possible futures. The intrusion of a Western perspective, cast in terms of "cultural capital," "the stranger" and "the art of memory," does not displace the Moroccan perspective, blot it out with alien conceptions—it reframes it. It makes of the Qadi's Story much more than a recounting of a life. It makes of it, in good Muslim fashion as a matter of fact, an emblem and figuration of the civilization in which it was formed.

** Preface

This book concerns the changing role of Islamic education, the concept of knowledge inherent in it, and the relation of its carriers to wider society from the early years of colonial rule in twentieth-century Morocco to the present. These complex themes are concretely presented through an intensive “social biography,” an approach which allows them to be explored in contextual detail without losing sight of more general issues of historical and social thought.

The subject of this study is a rural judge whose life and self-description contribute significantly to understanding the changing social role of religious intellectuals. Biography is a time-honored genre in American anthropology, and there are distinguished antecedents for the anthropological study of traditional intellectuals. Yet only in recent years have these concerns begun to be linked explicitly to the main currents of anthropological thought.

“Traditional” religious education, which thrived in Morocco until the 1930s, carried with it a sense of career which profoundly influenced the self-image of its carriers and their perception by others. Although the institutions of higher learning described in this study continue today only in highly altered form, the pervasive notions of personal responsibility, economic activities, and political authority shaped by them remain influential. Since the Iranian revolution, studies of Islam have focussed upon “resurgent” and militant movements. This study suggests alternative, popularly supported Islamic attitudes toward the contemporary world that form part of the background against which more radical Islamic visions can be better understood. It is also intended to complement studies of Islamic education in earlier historical periods, which have mostly concentrated upon institutional development and the political role of urban men of learning.

At another level, this book seeks to challenge the conventional view in Islamic studies and in studies of the Third World in general that “traditional” intellectuals constitute a social category of declining significance in modern political and cultural life. Western scholars have for the most part downplayed the vitality of Islamic learning in the modern era, a neglect reinforced by the tendency of nationalists and technocrats in North Africa and elsewhere to deny significance to men of learning whose notions of political action have differed from their own. Throughout widely fluctuating national political contexts, the ideas of knowledge prevalent in traditional Islamic education have continued to be largely congruent with popular understandings of religious knowledge. More than the study of earlier “golden” eras, a critical analysis of Islamic learning and its carriers in twentieth-century Morocco suggests the intricate ways in which ideas of learning and their modes of transmission influence, and

in turn are influenced by, the shifting historical and political contexts in which they are maintained and reproduced.

A number of people have generously contributed to shaping this book through extensive discussions, readings of earlier versions, and practical advice during my stays in Morocco. Early discussions with Ernest Gellner and the late Lloyd A. Fallers first suggested to me the range of issues related to the study of traditional intellectuals. Clifford Geertz provided intellectual support when this book began to take practical shape, especially during my tenure as a member of the Institute for Advanced Study, Princeton, during the 1976–1977 academic year. As editor, Margaret Case provided strategic encouragement throughout its writing. §erif Mardin, who has been working on comparable issues in Turkey, has also generously shared his ideas with me, and has allowed me to quote in Chapter Seven from a work in progress. David Hart, an institution in his own right, has set a standard of collegiality in sharing his Moroccan experiences that his Moroccan and foreign successors can aspire to emulate, and Kenneth Brown provided useful suggestions regarding the life of Mukhtar as-Susi.

Muhammad Aafif of the Universite Mohamed V (Rabat) is largely responsible for introducing me to recent historical writing in Arabic, has verified Arabic usage throughout the text, and in innumerable ways has helped me appreciate Morocco's contemporary intellectual traditions. Ross Dunn of San Diego State University and Lawrence Rosen of Princeton University have likewise offered valuable advice that has contributed to shaping the present text. Dr. Fred A. Levin, Assistant Professor of Clinical Psychiatry, Northwestern University School of Medicine, and Instructor, The Institute for Psychoanalysis (Chicago), has put his earlier training as an anthropologist to use in helping me explore the personal relationships depicted in this text. Abdellah Hammoudi and Roy P. Mottahedeh have also provided useful comments. Christine Eickelman's suggestions for this manuscript have as always been perceptive.

For the discussion of specific points and practical assistance in meeting participants in Morocco's traditional learning, I am especially grateful to Attouarti Ali ben Mouallem (Marrakesh), Hajj Ahmad bin 'Abd as-Salam al-Bu 'Ayyashi (Tangier), Mohammed Cherkaoui (Casablanca), Bouzekri Draiouiy (Casablanca), Miloudi Draiouiy (Boujad), and Najmi Mohammad (Casablanca). For nearly two decades, I have benefited from the intellectual encouragement and hospitality of friends and colleagues at Morocco's institutions of higher learning and have sought whenever possible to strengthen the practical ties between our institutions. If these colleagues are not mentioned by name, I nonetheless feel an equal gratitude toward them.

Finally, I thank Qadi Hajj 'Abd ar-Rahman Mansuri and his family. Hajj 'Abd ar-Rahman agrees with me that disguising their identity in a book of this nature would have obscured much of the specific networks of learning that this book is intended to explore. I hope that the final version of this book merits the trust they have placed in me. Final responsibility for errors of

fact and for interpretation is mine alone. To Hajj ‘Abd ar-Rahman is the credit for the openness and creativity characteristic to the world of traditional Islamic learning.

Portions of this book, especially Chapters Four and Five, appeared earlier in Comparative Studies in Society and History 20 (1978). The two maps have been prepared by Michael Bonine of the University of Arizona.

Arabic names and terms are fully transliterated upon first occurrence only and in the glossary. Any analysis which draws upon extensive interviews as well as written sources must necessarily cross the line between colloquial and written usage. I have usually given precedence to the colloquial form of terms and phrases.

* Knowledge and Power in Morocco

** Introduction

*** Learning and the State

The nineteenth century was a period of intellectual ferment for scholars and students at Morocco’s mosque-universities. In spite of the growing involvement of European powers in Morocco from the 1830s onward and the steadily worsening financial situation of the Moroccan state, higher education thrived and was alive with attempts at reform. As early as the reign of Sultan Sidi Muhammad bin ‘Abd ar-Rahman (r. 18591873), mathematics, engineering and astronomy were reintroduced as taught subjects, admittedly on a rudimentary level. Men of learning associated with the government were in the vanguard of the reform movement. At the center of reformist thought of the period was a rededication to the values which made the Islamic community {umma) great in the past. Through personal and collective effort {ijtihad.) and a renewed discipline of self and society through education and control {nizam), they considered that Islamic society would become revitalized, offset the growing European challenge, and at the same time accept useful contemporary innovations (Binsahd 1983: 28–33). To achieve this goal, some religious scholars were ordered to pursue studies, including military science, in Egypt and in Europe (al-Manuni 1973: 96–103; 114–125). The introduction of a lithograph printing press in Fez by 1865 significantly accelerated the diffusion of knowledge (Ayache 1979: 147; al-Manuni 1973: 203–212).

Sultan Mulay Hasan I (r. 1873–1894) also strongly encouraged scholars imbued with modernist, reform-minded ideologies derived from studies in the Arab East, primarily Cairo and Mecca. He took a personal interest in the debates of men of learning {‘ulama’-, s. ‘alim) (Jirarl 1976: 17–18) and encouraged higher education. His concern for higher religious studies was integrally linked to his efforts, not always successful, to modernize and expand the Makhzan (lit. “storehouse” or “coffer”), the name by which Morocco’s government continues to be known. These efforts necessarily involved recruiting men of learning for the administration. Likewise Mulay ‘Abd al-Hafiz, who was deputy sultan (khalifa) in Marrakesh prior to assuming rule himself (r. 19081912), was recognized as a scholar in his own right. Like some of his predecessors, he took a direct interest in propagating reformist Islam (Burke 1976: 135).

Despite occasional setbacks, reformist ideologies had become quite influential in Morocco’s ruling circles and with urban notables by the early twentieth century (Burke 1976: 37,101,135). There was a direct link between state authority (quwwa; sulta) and progress (al-taqaddum). At crucial moments in precolonial Morocco, as elsewhere in the Islamic world at earlier periods, men of learning played significant, if not always willing, political roles as spokesmen for the community (Burke 1972; 1976: 114–117; cf. Bulliet 1972; Hourani 1968; Lapidus 1967; Mottahedeh 1980). At the same time, Morocco’s rulers recognized the support of men of learning as a profound source of legitimacy (al-Fassi 1954: 2762–77)-

Until 1925, the convergence of popular and royal support for learning was exemplified in the annual feasts for religious students, discussed in Chapter Four, held at both the Qarawiym mosque-university (jami‘a) in Fez and the Yusufiya in Marrakesh. Students at both institutions selected a “mock” sultan among their numbers and other students formed his entourage. These feasts culminated in a public parody of Makhzan ceremonial, including the sermons (khutbas) delivered on Fridays and feast days. Often the real sultan was in attendance enjoying the spectacle, and the “mock” sultan had the right at the end of his “reign” to ask a favor of the real sultan.

Public recognition of the special role played by religious studies—no other category of Moroccans were accorded license equivalent to that of the students of religion—continued after the advent of colonial rule. At least once, in 1915, Marshal Hubert Lyautey, Morocco’s first Resident-General, personally attended the Feast of Students in Fez (Bidwell 1973: 19). Colonial authorities were acutely sensitive of the political overtones of the event and finally sought to curtail the practice in 1925 (Cenival 1925: 139). Nonetheless, the Feast of Students continued on a reduced scale until the early 1960s. Traditionally educated men of learning continued to enjoy widespread respect.

Morocco’s two mosque-universities continued to attract children of the country’s intellectual and political elite until the 193 os. At the Qarawiyin and the Yusufiya, men of learning acquired a culturally valued cognitive style, “a set of basic, deeply interiorized master-

patterns” of language and thought on the basis of which other patterns are subsequently acquired (Bourdieu 1967: 343), as distinct in its own way as was the tradition of learning epitomized by the legon in French higher education. In spite of the effective collapse of traditional Islamic higher education in the 1930s, the cognitive style exemplified by men of learning continued to be the most popularly respected form of knowledge, shaping the language of politics and political action.

[[d-f-dale-f-eickelman-knowledge-and-power-in-morocc-2.png][Figure 1. The Sultan of Tulba, Fez, 1925. [Reprinted with permission from Hesperis 5 (1925)].]]

The disjunction between the collapse of higher Islamic education in the 1930s and the continued respect for the culturally valued knowledge which these institutions transmitted and reproduced provides a useful point of departure for exploring the relation between systems of meaning and the social contexts in which they occur. There is an anthropological tradition, still very much alive, that presumes a direct, one-to-one correlation between ideology and social action (e.g., Douglas 1973; Durkheim 1915; Evans-Pritchard 1940; Lienhardt 1967; Mauss 1966). However questionable such an assumption of correspondence may be when applied to “simple” societies, it is decidedly inadequate when applied to societies such as Morocco that are complex, internally differentiated, and historically known. As Emile Durkheim recognizes in his largely neglected Evolution of Educational Thought (1977), changes in ideas of knowledge in complex societies and the means by which such ideas are transmitted result from continual struggles among competing groups within society, each of which seeks domination or influence.

The study of the role of men of Islamic learning in Morocco’s recent history also raises basic issues concerning the political responsibilities of men of learning, and the relationship between knowledge and political and economic domination. Just as Morocco’s rulers necessarily turned to men of learning in the late nineteenth and early twentieth centuries to expand the scope of governmental activities, so did the French once they established their protectorate in 1912. In the first decade of Morocco’s colonial era, religious scholars were almost the only Moroccans with full literacy in Arabic. Without the cooptation of men of learning, the colonial regime would not have been able to have expanded rapidly its administrative and taxation apparatus into rural areas.

Moroccan men of learning were opposed to the growing French encroachment (K. Brown 1972.); after direct French intervention, some men of learning and other religious leaders figured prominently in open resistance (Hammoudi 1981). But for the most part, they refrained from direct political involvement, as was earlier the case in neighboring Tunisia (L. C. Brown 1972; Green 1978) and Algeria (Christelow 1982; cf. Merad 1967). Others, recognizing the futility of direct resistance, allowed themselves to be used in “pacification” efforts in order to avert bloodshed. Particularly in rural society, where the overwhelming majority of Moroccans lived,[1] many men of learning, often from families of rural notables, agreed only with reluctance to cooperate with the colonial administration.

“Cooperation” with the French was an effective means of social mobility for many Moroccan notables, especially in the early years of colonial rule. It would be wrong to assume that all such “friends of France” were acting primarily in terms of self-interest, a charge subsequently leveled by many nationalists after Morocco regained its independence. Such interpretation in hindsight by nationalists admittedly explains why many men of learning have remained silent on their role during the colonial era. Some undoubtedly were opportunists. Military intelligence reports written during the first years of French presence in Morocco often suggest that the principal concern of notables was with preserving their wealth and status.[2] Yet these same reports make clear that the French were careful in their contact with notables, especially religious scholars, to stress that the French were acting at the request of the Makhzan in order to bring order and peace to Morocco. This fiction quickly wore thin, but men of learning and other notables recognized that they had no means of directly opposing the French.

Moroccan men of learning in the early part of this century resented the colonial presence but felt that the means of recovering Morocco’s autonomy was internal renewal and a recommitment to education and discipline. In this reformist “neo-Salafi” view, to adopt Binsa‘id’s useful term, Islam was the “religion of order” or self-discipline {din al-nizam) (Binsa’id 1983: 33). By the late 1940s popular nationalism eclipsed such ideas among a younger generation of educated Moroccans, but it would be wrong to regard such neo-Salafi ideas as no more than precursors of nationalism. I suggest in Chapter Seven that neo-Salafi thought may have more in common with what is generically known today as “resurgent” Islam than with nationalist thought. Many Moroccans remain uneasy in discussing neo-Salafi ideas today because of their implications for “collaboration.” Such a blanket interpretation constitutes an anachronistic misreading of an earlier era in which alternative notions of political responsibility prevailed among men of learning, ideas that remain important in defining the attitudes of many Moroccans toward state authority. Just as the French have found it difficult to recount the Vichy era, and for similar reasons, Moroccans have passed over many aspects of colonial rule in silence. Much of this silence is due to the difficulty the generation of Moroccans who experienced the earlier part of this era first-hand have in explaining its subtleties and ironies to those who only know it through the political rhetoric of later times.

*** Intellectuals: Context and Style

The Moroccan historian Abdallah Laroui (1977b: 191) argues that Moroccan men of learning in the nineteenth century possessed “the moral influence that legitimates all political action.” By the late 1920s they ceased to form the near-totality of educated Moroccans, especially after the children of the elite shifted from the great mosque-universities to the schools established by the French for the sons of notables. The influence of men of learning nonetheless remained significant, especially in the countryside. In the independence movement of the early 1950s, some formed the cadres of rural resistance or actively supported them, especially in the hinterland of Marrakesh. In some regions of southern

Morocco in the 1960s, notables who were also men of learning could still win elections simply by standing for them (Leveau 1976: 93, 116, 188–189), although this was no longer the case for many other regions of the country (e.g., Rosen 1979: 50–53).

The relation between prevalent style of religious knowledge carried by the traditionally educated and the wider social context in which such notions are maintained is especially evident in rural Morocco. As a category, men of learning in rural society constituted an important pool from which Morocco's "secondary elite" were drawn, those who allowed the rulers to rule (Mosca 1939). I describe them as a category rather than as a group because the carriers of religious learning are recognized as sharing that attribute alone, and do not constitute a group that acts together politically or in any other way. Indeed, although some men of learning compose an important element of the rural elite, others, such as rural Quranic teachers, do not.

Writing of an admittedly different social and cultural context, Antonio Gramschi (1971: 14–15) considers rural intellectuals to be "organic" in the sense that every development among the peasantry "up to a certain point, is linked to and depends upon movements among the intellectuals." For Gramschi, intellectuals—clerks, judges, teachers, scribes, other professionals, and (my own addition for the Moroccan context) educated merchants—bring the peasantry into contact with the local and state administration. Gramschi argues that intellectuals are few in number in rural society, their command of literacy is understood by few, and their social position is such that it is difficult for them to act independently of the established social order (cf. Schumpeter 1962: 147). Even if rural intellectuals are not directly involved in political administration, it is difficult to separate their various roles as judges, notaries, and clerics from the political milieu. Moreover, the standard of living of rural intellectuals is generally higher than that of much of the rest of the rural population, so that the peasantry looks to the "gentlemanly" rural intellectual as a social model to which at least one of his own sons might aspire. Even if not always resulting in economic advancement, the pursuit of religious knowledge in rural Morocco is seen as a commendable end in itself.

Gramschi's notion of intellectuals in rural society needs comment. Other scholars, notably Edward Shils (1972: 3), characterize intellectuals as persons "with an unusual sensitivity to the sacred, an uncommon reflectiveness about the nature of their universe and the rules which govern their society." An intellectual by this definition need not be confined to the formally educated or to those explicitly engaged in mental work. Nor is it evident that persons engaged in such pursuits as notaries, scribes, and judges lead an "intellectual" life by reason of their profession. Despite Gramschi's choice of terms, his formulation equally approximates the original Russian notion of intelligentsia as the educated class of society, or those to whom "advanced" political or, as in rural Morocco, religious ideas are attributed. Although it is useful to separate the two notions of intellectual and intelligentsia for some purposes, Gramschi's merging of the two notions points to a necessary and significant overlap in contexts where full literacy is possessed only by a minority, as has been the case in Morocco until recent decades (see Chapter Three).

Profound changes are underway in the role of Islamic learning and of its carriers in Moroccan society and in other Islamic countries, although, given the lack until recently of scholarly attention to contemporary Islamic learning, it has been difficult to trace these changes in detail. Only within the last decade (esp. Akhavi 1980; Fischer 1980a, 1980b, 1982), has there been renewed interest in the subject. In the case of Morocco, an interest in contemporary Islamic learning was sustained almost alone for many years by a talented colonial administrator, who subsequently became an academic at the end of the colonial era (Berque 1938,1974). Scholarly interest in the theme was marginal.

A compelling reason for the benign scholarly neglect of “traditional” intellectuals is that there was no clear place for them in prevailing assumptions concerning the role of intellectuals in contemporary societies. Abdallah Laroui (1967: 19–28), for example, divides contemporary Arab intellectuals into three main categories, a triad implicit in the writings of many other Arab intellectuals. First are the clerics, the religious intellectuals who seek a definition of society and the means to its improvement in religious ideology. Second are the politician-liberals, who seek the betterment of society through adopting political forms inspired largely by the West. Technocrats constitute a third broad category encompassing everything from militant Marxists to “apolitical,” Western-educated advocates of social engineering. Despite other differences, intellectuals in this category share the conviction that society can be improved largely through “rational” means that require minimal attention to their society’s specific cultural heritage.

Laroui’s argument that each of these three intellectual styles has predominated in successive historical contexts is problematical. It ignores the progressive differentiation of intellectual styles and orientations that has taken place in the twentieth century. These intellectual styles coexist in the contemporary Middle East and, as indicated by Laroui’s repeated and appropriate invocation of the experience of his native Morocco, often overlap in intricate ways.

In contrast to Laroui’s sharp delineation of politican-liberals and technocrats, his category of “cleric,” the most complex of the three, is the most vaguely delineated and residual. Fischer (1982: 108), more immediately concerned with contemporary clerics, delineates five major clerical orientations in Iran, each with differing ideological and organizational implications. Fischer’s categorization is more effective than Laroui’s, at least for Iran, in suggesting the wide spectrum of available and emerging religious ideologies and orientations to action, ranging from “reformist” ideologies that require active persuasion to win adherents and that represent a break with the status quo, to notions that profoundly resonate with popular, existing religious understandings.

Of Laroui’s categories, the clerics are for the most part also less interested than the carriers of the other two intellectual styles in pursuing dialogues with Westerners or with Western-educated scholars. As Albert Hourani (1970: viii) wrote in the first reissue of Arabic

Thought in the Liberal Age, most studies of Arab intellectuals, including his own, “did not say enough” about those who rejected or disregarded “the dominant ideas of modern Europe.” The resulting miscomprehension of Iranian society requires no further reiteration, but in other countries there has been a similar neglect of the influence of the traditionally educated. In the case of Afghanistan, Ashraf Ghani argues that the traditionally educated intellectuals, many of whom today have also had some education in state-sponsored educational institutions, continue to play an important role in shaping attitudes toward modernism and the west.[3] The publication of the works of a fourteenth-century theologian, Ibn Taymiyya, can stir major intellectual and political controversy in Egypt in the 1980s (Sivan 1983). “Traditional” intellectuals place a particular value upon the past, but are not necessarily locked into the past. Intellectual traditions can undergo major changes that their carriers do not regard as such (Shils 1981: 14). I argue that this has been the case with Islamic “clerics.”

The notion of contemporary clerics as a residual category equally pervades the influential work of Edward Shils. For Shils, intellectuals possess an “innate need” to be in “frequent communion with symbols which are more general than the immediate concrete situations of everyday life” (Shils 1972: 16). Although intellectual work originally arose from religious occupations, Shils writes that religious orientations in modern times attract “a diminishing share of the creative capacities of the oncoming intellectual elite” (ibid.). In Shils’ view, among Western intellectuals in earlier periods, and Asian and African intellectuals since the nineteenth century, “the tradition of distrust of secular and ecclesiastical authority—and in fact of tradition as such—has become the chief secondary tradition of the intellectuals” (1972: 17). The notion of the sacred has shifted in his view from religious concerns to a focus upon and mastery of the technological, organizational, and political skills most useful in forging a modern state in the face of congeries of primordial loyalties. In terms of Laroui’s categories, the present belongs to the liberals and the technocrats. Shils argues that in the contemporary world, intellectuals are found primarily in the differentiated “modern” class. He argues that only intellectuals attached to “modern” values have the vision to rise above parochial identities and to attach themselves to the notion of a modern nation-state.

Shils notwithstanding, traditionally educated Islamic intellectuals also emphasize identities that are far from parochial, even if not wholly congruent with the technocratic and “liberal” vision of what is needed to maintain a modern nationstate. Unfortunately, the notion of an all-important “modern” category of intellectuals that accompanied the heyday of modernization theory in the 1950s reinforced the tendency to treat clerics as a residual or disappearing category on the margin of significant political activity. As a practical reminder of this attitude, a reviewer for a proposal I wrote in the mid-1970s commented that it had merit only as history, not as anthropology, for “traditional” Islamic intellectuals throughout the Middle East were isolated, dying old men with no significant influence upon contemporary events. There are specifically anthropological precedents for the study of intellectuals and intellectual traditions elsewhere in the world (e.g., Griaule 1965; Radin 1957; Turner 1967: 131–150), but not for the Middle East. Only the 1978–1979 Iranian revolution returned to the center stage of social thought a tradition that has remained vigorous, if not always politically dominant.

** One: Biography as a Social Document

Because of its complexity, Moroccan society lends itself to the use of biographies as a means of understanding wider social and political realities. Two talented journalists (Lacouture and Lacouture 1958) portrayed the key social and political forces of the period leading to Morocco's independence through biographical profiles of major French and Moroccan political figures. Jacques Berque's (1958) account of the seventeenth-century religious scholar Sidi al-Hasan al-Yusi (1631–1691), who also figures prominently in Clifford Geertz's Islam Observed (1968a), depicts the intellectual and religious milieu of a crucial era in Moroccan history. A political scientist (Waterbury 1972) has used the life of a prominent Susi merchant in Casablanca to exemplify the economic and political sensibilities of an entire generation, and anthropologists have used biographies as devices to analyze such diverse topics as possession states (Crapanzano 1980), the nature of ethnography and the ethnographic encounter (Crapanzano 1980; Dwyer 1982), family relationships (Munson 1984), and political and "cultural" alienation (Rabinow 1975). Each of these studies succeeds to the extent that it convincingly depicts major social and cultural issues. Yet, for English-speaking readers, the notion of biography immediately evokes a Victorian genre for which, because its primary audience is assumed to share a common cultural heritage and knowledge of historical context, more general issues are often raised only obliquely.

The study presented here is intended as a social biography. By focusing upon the training, career, and moral imagination of a rural qadi, it reduces the familiar notion of the "documentary method" to its minimal form. Clifford Geertz, who traces the notion through Harold Garfinkel and Karl Mannheim, characterizes this approach as the interpretation of

... a single naturally coherent social phenomenon ... a specific manifestation of a more comprehensive pattern which has a very large, in some cases virtually infinite, number of such embodiments and manifestations, the one at hand simply being regarded as particularly telling in the fullness, the clarity, and the elegance with which it exhibits the general pattern (Geertz 1965: 15 3–154).

Social biographies, called life histories by some anthropologists, are often considered to be closer to raw data than analytical presentations. The distinction between the anecdotal and the social document is often unclear. Yet as an analytic device, the social document can be an effective means of exploring uncharted territory (Young 1983: 479–480). In Islamic studies, Louis Massignon (1982) uses a biography of the Sufi al-Hallaj (858–922) as a point of departure for a comprehensive discussion of Islamic mysticism. In this study, I use a social biographical approach to break accepted stereotypes held both by Westerners and by many Middle Easterners themselves of Islamic learning and its carriers.

I use the term social biography rather than life history to emphasize that this narrative does not purport to be a vehicle to allow a Berber qddi, Hajj ‘Abd ar-Rahman Mansuri, a friend and consociate thirty years my senior, to speak for himself. His voice is present throughout the text, but so is mine. A significant part of this account is the result of extended dialogues in some respects like those contained in Marcel Griaule’s Conversations with Ogotemmeli (1965). Unlike Griaule’s narrative, which is primarily a one-way representation of indigenous thought, this account incorporates multiple voices, especially that of the ethnographer. An awareness of multiple voices is, I think, essential to understanding the nature of the anthropological encounter today (cf. Geertz 1968b). The ethnographer’s presence is almost invisible in a monograph such as Evans-Pritchard’s The Nuer (1940) or even in “autobiographical” narratives such as those presented by Oscar Lewis (1961); in some recent ethnographies the selfreflexivity of the ethnographer, concerned about the “power relationships” of the ethnographic encounter, almost preclude further ethnographic analysis. I think that ethnography involves a balance between the two extremes. As the qadi and I worked together, we both became aware of our differences in understanding how events could be narrated and interpreted, of what was said and what was left out. These differences became part of the record of interpretation. Through my questions and his, we became mutually aware and appreciative of our respective intellectual projects. When I first became acquainted with the qadi, I was barely aware of this dimension of ethnographic understanding. Especially in the heydey of structuralist analysis in the 1960s, ethnographic analysis had been conveyed to me as a priestly tradition in which the conscious understanding of “natives” or their efforts at understanding their own society played a minimal role.

The decision to portray the social context of Islamic knowledge in rural Morocco through the social biography of a living qadi is in part fortuitous. Hajj ‘Abd ar-Rahman was born in 1912 in Bzu, a small Berber town in the foothills of the High Atlas mountains. After studying in Bzu and its environs, learning to speak Arabic in the process, he went in 1928 to the famed Yusufiya mosque-university in Marrakesh, where he remained until 1935. Then his politically minded elder brother, by then the qadi of Bzu, cut short his studies in order to have him appointed as Bzu’s deputy qadi.

I met Hajj ‘Abd ar-Rahman during my first field research in Morocco (1968–1970). He was then qadi of Boujad, the regional pilgrimage center in which I had chosen to work. He was also my landlord. Only toward the end of my first stay in Morocco did the idea of specifically writing about his life begin to take shape. I first broached the idea to him in late 1969, although in reviewing my notes prior to then I find extensive entries related to his personal experiences, perceptions, and participation in the events of this century. At first I regarded these discussions to be on the margins of my primary work on Boujad, since the Hajj was from elsewhere in Morocco. Nonetheless, I recorded them as systematically as I did all my field notes, as soon after discussions as possible, in order to preserve the texture of the original discussions. At his request, we never used a tape recorder; he regarded the device as breaking the confidentiality of discussion. In any case, when I failed to understand a point developed in my notes, we could return to it later. The extensive record of our discussions was completed before I raised the possibility of writing specifically on him, and has served as an excellent check on whether he subsequently shaped his narrative and presentation of

self to accommodate his new role as the subject of a book. Because of his notion of presentation of self, discussed in detail later in this chapter, I think that such distortion has been minimal.

I subsequently returned to Morocco several times (summers of 1972-, 1973, 1976,1978,1981 and 1984). Each time I took the opportunity to work further with Hajj ‘Abd ar-Rahman and to interview other scholars and associates of his who were at the Yusufiya. The task was made easier by the fact that he had kept a diary and assorted personal papers since the early 1930s, though they were in part destroyed for fear of reprisals during the colonial era, and the diary was not, in the Western sense, a systematic, cumulative record of personal events and experiences. It was episodic, recording only those actions and events that to him formed “history.” The fact that it was not a Western-style diary was in itself significant. It provided a document which, although it was his creation, was independent of the two of us and could be used as a point of departure for interpretation.

I agree with Laroui when he observes that of his three types of Arab intellectuals, the “clerics” are those least interested in communicating with Western scholars. Yet he also notes that the foreign scholar has, at least at the outset, certain advantages over the indigenous one, especially in the study of elites. As an outsider, the foreign scholar is less suspect of participating in local rivalries and thus is more likely to secure cooperation (Laroui 1977b: 15). As a “stranger” (Simmel 1964) at the outset, the foreigner is also obliged to ask basic questions about the nature of the social world that “natives” are supposed to know and therefore do not or cannot ordinarily discuss with one another.

I shared at least part of ‘Abd ar-Rahman’s social world on a long-term, first-hand basis for two years in Boujad. During this time, in company with him and on my own, I also met many of his friends and fellow administrators in visits throughout western Morocco, Marrakesh, and its hinterland. In subsequent returns to Morocco, after I had specifically decided to write about ‘Abd ar-Rahman and traditional Islamic learning, I built upon these existing ties and developed others.

Some Moroccan men of learning discouraged me from writing about a rural qadi. They felt that I should invest my time in studying the pinnacle of erudition as they conceived it, and argued that the life of a country judge would provide me with a distorted, impoverished image of Islamic learning. My response was to observe that Moroccan men of learning themselves were much better situated than I was to interpret trends in the body of Islamic knowledge as it is understood and developed in Morocco today. My own intent was instead to focus upon the contexts in which such knowledge was learned, elaborated, and reproduced, and how it was valued in society at large. Once some men of learning realized that my intent was not to replicate Islamic knowledge as they alone could understand it, they agreed that the world of traditional learning about which I chose to write was rapidly becoming unfamiliar even to a younger generation of Moroccans, so that there might be some value in my scholarly project after all. Perhaps some merely appeared to acquiesce in

my rationale because they saw there was no point in dissuading me, although the tenor of questions suggested a clear understanding of my project, if not always acceptance of it. The fact that my initially “unfamiliar” goals could be comprehended and respected by traditional men of learning, especially those who had little to do with foreigners or the foreign-educated, reaffirmed for me the openness and flexibility of the world of traditional Islamic learning, attributes not generally accorded to it by those who observe it from a distance.

*** The Anthropologist and the Judge

In November 1968, once I decided to work in Boujad, I had the difficult task of finding a place to live. In the company of an impoverished tribesman who had recently settled in Boujad in order to become an underemployed tailor, I spent several chilled, drizzly days on foot in Boujad, looking at dozens of houses that my wife and I heard might be available for rent. With the exception of an English missionary who had been in Boujad since the late 1930s, no foreigner ever chose to live in the old quarters Imadtna). The few French teachers assigned to Boujad were spatially segregated in bungalows next to the administrative center, and kept largely to themselves, socializing only minimally with their Moroccan colleagues. Adequate housing was scarce, and my insistence upon living in the madina was viewed as odd. Local government officials, who to their credit were indifferent to my presence rather than hostile, were not prepared to offer any suggestions. They simply did not know how to handle foreigners who did not fall into the accepted pattern of self-segregation. As I trudged through the madina, it was depressing to be offered everything from houses with caved-in second stories (“Just step around the hole in the floor, and it’s a fine apartment”) to one vacant for a decade because it was said to be occupied by jinn (“They shouldn’t affect you”). In retrospect, I obtained a very good idea of the traditional quarters and was informally introduced to a number of merchants and residents. At the time, however, the sheer bleakness of available housing weighed more heavily upon me. Finally, at dusk on the third day, just before the sunset prayers, I was led to the house of the qadi.

Over tea, the qadi questioned me at length about my work and had me translate into Arabic my official Moroccan letter of introduction, written in French. He then left us to say his sunset prayers at the neighborhood mosque. When he returned, he said that he was willing to rent us his empty two-room apartment across the street.

So Hajj ‘Abd ar-Rahman Mansuri became our landlord. As the notable of our quarter, Darb Zalaghi, he was impeccably hospitable to my wife and me. Due to my own inexperience, our relations were nonetheless rocky at first. For instance, we had a misunderstanding on the electricity bill, which he had agreed to pay until it became clear that our working habits made us major consumers. Then, a month later, I was at home recovering from anthrax (an unexpected fringe hazard of field research), when a workman suddenly began removing our windows from the outside in order to brick up the openings. Our landlord had not informed us that he was building a second house abutting our own. Work was suspended until I had

recovered, but the fact that we were not informed about his building plans and had to endure the noise from months of intermittent construction did not please us. I fortunately vented most, but not all, of my petulance only in my field notes.

In January 1969, I began regularly to attend the weekly sessions of the Islamic court (mahkamat ash-shra") held each Thursday, the day of Boujad's weekly market. The court handled all matters pertaining to marriage, divorce, support, inheritance, and land transactions subject to Islamic law. Because court business in Boujad itself was light, Hajj 'Abd ar-Rahman had become a Moroccan circuit rider. On rotating days of the week, his one-armed bailiff drove him to other courts in the region: Wad Zam, Qasba Tadla, and Bnl Millal.

Sometimes I accompanied Hajj 'Abd ar-Rahman on his rounds, but it was easier to follow court proceedings in Boujad than elsewhere. Until the mid-1970s, when a new building was constructed by the Ministry of Justice, sessions were held in a small room in the former colonial administrative center (controle), constructed in 1931. The only furnishings in the room beside a telephone (one of some thirty in Boujad) were a rickety table with three chairs, for the judge, his clerk, and (when I was present) the anthropologist. Litigants sat on a narrow wooden bench about ten feet long, situated about six feet in front of the qadi's table. Except for myself, no spectators were allowed. Litigants waited their turn outside or followed proceedings from the windows.

The modern courts in larger towns, designed by French architects, were much more august and spacious, with imposing desks for judges on an elevated dais. Litigants were kept up to twenty feet away. Much as in an American court, a large number of spectators were accommodated on rows of wooden benches with backrests. In such conditions, it was difficult to follow proceedings. In part this was because of poor acoustics, but it was also because many spectators spoke in low voices to one another while awaiting the case of particular interest to them. The spatial design and presence of spectators also imposed a formality on the proceedings not present in the Boujad court.

In Boujad, the qadi decided that I must sit with him and his clerk, since I could not sit with the litigants. I always moved my chair to the edge of the table to indicate that I was not part of the proceedings. Nonetheless some tribesmen unfamiliar with court procedures recognized me as a foreigner and sometimes saluted, perhaps assuming that a small pocket of colonial influence survived independence in 1956. Others paid scant regard to me. With writing-pad before me, I was taken to be another clerk. Litigants would rise and try to move even closer when proceedings got heated. One task of the bailiff, usually armed with a cane, was to push them back. The qadi had worked with his baliff and one of the two rotating clerks for years, so that there was an easy working relationship among the court officers.

For each court case, litigants had to engage a notary to prepare a deposition. Since notaries charge by the page for such documents, many had little concern as to whether claims and

counterclaims had legal validity or even fell within the jurisdiction of the court. The qadi took a few moments to study these documents. If the claim was properly prepared and fell within the scope of the court, a summary of it was dictated into the record by the qadi. The qadi put questions to the litigants to verify the facts of each case. A summary of questions and his decision were then dictated in classical Arabic, accompanied by citation of the appropriate sections of the Moroccan personal status code.[4]

Few tribesmen could follow the proceedings. When the facts of a case had to be clarified through questioning, the litigants more often than not tried to recite the entire history of the dispute, which was extremely useful to me but not to the court. The qadi usually put his questions in colloquial Arabic. Since the verdict, however, was given in classical Arabic, litigants often were unaware of the decision. The judge left it to the bailiff to “translate” the verdict into colloquial speech, which he often did by pointing to litigants and saying, “You won! You lost!” and ushering them, confused and protesting, out of the room.

In contrast, the qadi welcomed my interest in court proceedings. Because the Boujad court calendar was usually uncrowded, Hajj ‘Abd ar-Rahman often took a few minutes between cases to explain to me the legal issues involved and what the litigants were trying to accomplish. Often he knew the background to the cases from sources outside of the court. Many litigants, especially townspeople, often sought his advice outside of formal court sessions in order to avoid court proceedings.

When I first began to attend these sessions, ‘Abd ar-Rahman and his clerks tested my understanding of the proceedings. They were difficult to follow, but my prior training in classical Arabic was useful: I knew much of the legal terminology, and the legal issues involved were rarely complicated. The major initial problem in anthropological inquiry is how to get people to explain their perception of events as they would to an “insider” (Merton 1972). The most valuable anthropological work begins once people take for granted a shared appreciation of the issues at hand, although these “background” perceptions are usually the most difficult to elicit. Some people, including Hajj ‘Abd ar-Rahman, began to see not only that I knew more than I could readily explain but that there was a pattern to my questions and started to take an interest in them.

Regular attendance at the court meant that I soon learned the issues involved. I began to ask questions that “insiders” could conceivably ask. If I learned that someone had brought the same case to the court in i960,1 would ask how the i960 case differed from the 1968 one. This type of question engendered specific responses, usually laced with other practical examples indicating how the use of courts was but one element in the resolution of grievances. If, on the other hand, I asked an abstract question about property or inheritance rights, Hajj ‘Abd ar-Rahman’s response was usually as formal and devoid of realistic context as the initial question.

Thursday and Friday were the social high points of the week for Boujad's notables. On Thursdays they held major lunches for one another and for tribal clients who had come in for the market. Lunches were also held on Fridays, after the prayers and sermon in the principal mosque. After court, the qadi often invited me to accompany him, so I regularly saw notables who were otherwise indifferent to my presence. Ordinary conversations concerned real estate and market transactions, and cryptic local gossip not openly explained to me. With my notebook often near at hand, I may have appealed to Hajj 'Abd ar-Rahman as a poor man's Boswell and obliquely lent him status. When I put questions to him directly, he seemed pleased to live up to his reputation as a man of learning and speak "high words," quotations from the Quran and classical Arabic literature. Sometimes he used a discussion with me as a polite way of extricating himself from other conversations. In any case, I was tolerated, and pretended to understand and appreciate more of his quotations from legal texts and Andalusian poets than I, or most of the others present, could readily assimilate.

I rarely saw Hajj 'Abd ar-Rahman alone during the first months of our stay in Boujad. In March 1969, he invited my wife and me to travel with him to Bzu, his village of birth, where I met his elder brother, Ahmad Mansun, for the first time. I knew of his elder brother's reputation for Islamic learning, but I was still unaware that there were interesting questions to ask concerning the role of Islamic learning and that it was as necessary to understanding Islam in Moroccan society as were the maraboutic practices that were then at the center of my research (Eickelman 1976). Maraboutism was the prevalent popular belief that certain persons, living or dead, possess a special relation toward God which makes them particularly well placed to act as intermediaries and to communicate God's grace (baraka) to their clients. This implicit belief was in uncomfortable tension with Islam as understood by educated Moroccans and many townsmen. Tribesmen from throughout western Morocco annually visited Boujad because of the presence there of major shrines, and the town's religious, political and economic leadership had until recent times been held largely by members of the Sharqawi maraboutic descent group.

Understanding these popular religious beliefs and historical change in them was in itself a complex, engrossing task. My attitude at the time was that visiting with rural notables in other parts of Morocco provided me with an interesting break in routine and an opportunity to set my own intensive work in Boujad and the Tadla plain in an appropriate wider context. I could not possibly master the nuances of local political detail for other regions, and I had not yet realized the significance of formal Islamic learning and its carriers in establishing important transregional links.

*** The Sharqawi Papers

In June 1969 my conception of what was important and possible in field research changed abruptly through one of the accidents common to anthropological fieldwork. Since the late nineteenth century, the Sharqawa of Boujad, the maraboutic descent group that I was studying, had been divided into two major factions, made all the more permanent when the

French conferred the title of qadi upon the leader of one and qa’id, meaning in this case an urban chieftainship, upon the leader of the other (Eickelman 1976: 196–202, 239–254). At the beginning of the Protectorate in 1912, the office of qaid looked like the more significant of the two (Cimitiere 1913). Yet by the 1940s it became clear that this office, more than that of qadi, was compromised through collaboration with the French. Its attentions were devoted almost exclusively to local concerns, and its leaders proved unprepared to adapt constructively to Morocco’s changing political circumstances.

Unlike the faction and descent group allied with the qaid, members of the faction awarded the “consolation” of the qadiship invested heavily in education and moved to Rabat and Casablanca. Some of its members were early participants in the nationalist movement. The marriage of a prominent member of this faction to the daughter of King Muhammad bin Yusif (Muhammad V) (r. 1927–1961) shortly after independence, and his subsequent appointment to ministerial and ambassadorial posts, assured the eclipse of the other faction.

In the first month of my stay in Boujad, I met one of the notables of the “Zawiya” Sharqawa, as the faction that formerly held the qaidship was locally called. He showed me a cache of documents, most of which dated from the late nineteenth and early twentieth centuries, related to Sharqawi leaders and their ties with tribes, merchants, Morocco’s rulers, and the French. He assumed at the time that I had no command of written Arabic. I was supposed to admire the calligraphy and the seals of various sultans. When it became clear that I could also read the documents, they were quietly eased away from me. I was repeatedly assured that I could study them later, but as the months passed an excuse was always found not to produce them.

In the meantime my wife, who also speaks Arabic, had developed cordial ties with some of the women of the notable’s household. Contrary to popular stereotypes, some Moroccan women are quite independent and decide household matters themselves (Davis 1983). My wife mentioned my interest in seeing the documents and the fact that I had been assured access to them. Somewhat to her surprise, one day they were produced without fuss, and I had them on loan for several months.

There were some six hundred documents in all. Some concerned marriage contracts and inheritance. Others were letters to and from various Sharqawi leaders concerning such topics as revenues from estates, pilgrimage income, safe conducts and the release of prisoners, local and national politics, and relations with French military intelligence. Collectively the documents provided an intimate view of the practical operations of a religious lodge during the tumultuous final years before the protectorate.

The notarial script of most of the documents was excruciatingly difficult for me to read, and the nibblings of mice at many of the documents did not facilitate my task. I engaged a local notary Cadi) to dictate them into a tape recorder. Even with this help, the

language of the documents was difficult and depended for interpretation upon a knowledge of the personalities and unrecorded local events of the period.

I assumed at the outset that Hajj ‘Abd ar-Rahman was too busy with other matters to be concerned with my inquiries, but I asked one of his sons, an excellent student then in secondary school, to assist me with the letters. Every few days he took some letters home and returned with meticulous transcriptions into ordinary Arabic script, as opposed to the difficult notarial one, and reasonably accurate translations into French. I was impressed by his apparent ease in deciphering notarial script and explaining the letters. One day I asked him to assist me on the spot with a document on which I had been working alone. He then casually told me that he couldn’t read the script either. His father had actually been doing the work.

Just before the sunset prayers that very evening, I noticed the qadi himself standing on the street outside our apartment. Men of the neighborhood often gathered outside the small mosque adjoining our apartment before and after the evening prayers, but the qadi rarely joined them for long. Moreover, this evening he was alone. I guessed that he wanted to see me. I went out to the street to join him, exchanged courtesies, and as if by chance showed him a few of the documents. He smiled and immediately invited me to his house.

That evening we began a series of meetings that went on for three months, until Hajj ‘Abd ar-Rahman’s unexpected transfer to neighboring Wad Zam in September 1969. Depending on his schedule and mine, we met daily for as long as six hours. On days when his official schedule was full, he eliminated his customary afternoon nap in favor of our work. Sometimes we began after a light supper and continued until midnight. After our first few meetings, he ordered his family and servants to say that he was not in if anyone called who could be sent away. When he was unavoidably called away, he left me by myself in one room and dealt quickly with the caller. His excitement in working with the documents was transparent and contagious.

His interest in the documents was complex. After our first month of work, he showed me notebooks he had prepared when he was first assigned as a qadi to Boujad in 1957. The Sharqawa had owned agricultural estates in Bzu since the eighteenth century, so Hajj ‘Abd ar-Rahman had prior familiarity with some Sharqawi notables. Nonetheless, his notebooks showed that he had faced the same initial difficulty as I had in tracing out the intricate ties of local kinship and patronage. Whenever he had come across marriage contracts or inheritance documents in the course of his work which clarified Sharqawi interconnections, he had recorded their relevant details in his notebooks. Since his arrival in Boujad, he had been aware of the existence of the documents we were now studying, but he was never given an opportunity to see them. I subsequently learned that the notable holding the documents, himself unable to read them properly, feared that some papers might have a bearing upon current inheritance disputes; none did.

[[d-f-dale-f-eickelman-knowledge-and-power-in-morocc-3.png][Figure 2. The Anthropologist and the Qadi, 1969. The photograph is posed at the qadi's request. Hence the bound volume in his hands.]]

Making sense of the "Sharqawi papers" was exciting but grueling work. Cohn (1981: 247) writes of the rise in recent years of an "anthropological history" whose goal is to "grasp the meanings of the forms and contents of texts and codified oral traditions in their own cultural terms" instead of as reflections of European history (see also Becker and Yengoyan 1979). I was learning to follow the contours of an "indigenous form of knowledge" in a manner that was as rewarding as the interviews I was conducting in other contexts. Moreover, I was working side by side with a "native" scholar, then in his late fifties, with his own fully developed perspective on how to interpret the documents.

The terms, concepts, and social world evoked by these documents were at first bewildering. The style in which Hajj 'Abd ar-Rahman related events was likewise difficult to comprehend, and I began to realize that understanding how he interpreted historical documents and learned to do so would in itself be an important component of our common work.

As we sorted through the mass of documents, Hajj 'Abd ar-Rahman made linkages between persons, incidents, and property of which I was at first only dimly aware. Of equal importance, I needed innumerable glosses on the evaluative terms invoked by the qadi in order to understand the significance of the papers. For instance, the qadi would refer to the style and calligraphy of a particular Sharqawi as "common" 1,'dmmi). I knew the term of course, and the notable/commoner (nas khassa/'awam) distinction which was invoked in a variety of contexts, often on the basis of claimed descent in Boujad. Hajj 'Abd ar-Rahman usually used the term to distinguish between those who were educated and those who were not. My questions, intended to confirm my understanding of this distinction, led to a concrete discussion on the nuances of writing and how the "educated" perceived historical events. We discussed such topics as the contents in which the various documents were originally written, the importance of calligraphic style to men of learning, and why there is no terminological distinction among men of learning between biography and autobiography, both known as tarjama (pl. tardjim). I was being given a practical introduction to the rhetorical style valued among men of learning and how it was acquired.

Often I was astonished at 'Abd ar-Rahman's assiduity in extracting full meaning from every document. Marriage contracts were one such subset of the documents. He knew enough of the background of the persons involved, often long deceased, to suggest why a certain marriage may have occurred. Or, quite frequently, he would make discreet inquiries of other persons to confirm his speculations. On one occasion, I was present at a luncheon with a Sharqawi notable when the qadi worked a question concerning some nearly forgotten marriage into his conversation, then feigning disinterest so as not to arouse too much

curiosity. He carefully separated his own assumption of motives from “real” history, which to him was a reliable record of actual speech and action.

Hajj ‘Abd ar-Rahman enjoyed work on the Sharqawi papers as much as I did. An enumeration of the property included in the bridewealth (sdaq) of a marriage in the 1890s enabled Hajj ‘Abd ar-Rahman, prompted by my questions, to organize his own thoughts (and information sometimes scattered in his notebooks) on the rural economy of an earlier period, caravan routes and their organizers, and the Makhzan’s varying practical scope. During one of our sessions, I recall setting aside a document because in my judgment it had served too long as a rodent snack to be of further value. Hajj ‘Abd ar-Rahman was not so easily deterred. From the date, the handwriting, and a few decipherable phrases he was able convincingly to explain to me how the letter was related to more complete documents we had already seen.

Almost any topic triggered a systematic introduction to another domain of knowledge and practice. One day, entering his courtyard, I saw a number of men’s tunics (jallabas) being sunned. I had not previously sought to distinguish among them, and casually asked the provenance of one. The result was an hour’s discussion of the origins of particular materials, regional styles and how they were linked to different claims to status, how they were obtained and distributed, and the progressive impact in his lifetime of European textiles upon their production and manufacture.

Despite a difference of thirty years in our ages and radically disparate backgrounds—for my part I was not born a Berberspeaking Muslim nor educated to be a qadi—we began to regard one another as colleagues because of our work on a common project. Hajj ‘Abd ar-Rahman’s Boujad notebooks indicated his own ethnographic efforts. My own notes were better than his in terms of explaining general patterns of relationships. He was fascinated that this could be so, given the thinness of my understandings of local conventions in other respects. He was especially fascinated by the information codified in my yards-long charts of Sharqawi family ties and later his own. He knew far more local and regional history and could relate it quite intelligibly to his peers, although I had a decided advantage in interpreting local social history for a wider audience. We learned from one another and we both were aware of the fact.

I also learned the art of framing delicate questions from Hajj ‘Abd ar-Rahman. As we worked on the Sharqawi papers, he began to see more clearly a pattern in the issues I pursued with other people. Sometimes he would lend a hand. Late in my initial period of field research I tackled the sensitive issue of resistance against the French in neighboring Wad Zam, the scene of a bloody uprising in August 1955. It was instigated by the Wlad ‘Isa section of the Sma‘la tribe; ninety-five French colons were killed in the course of a morning. Colonial authorities were shocked at the strength of this rural uprising. They had come to assume that militant resistance to colonial rule was predominantly urban.

‘Abd ar-Rahman and I had accepted an invitation of a local notable to lunch. A tribesman from the Wlad ‘Isa had somehow invited himself along. Our host, an influential landowner and notary, was visibly annoyed. He made jokes at the expense of the tribesman and his illiteracy. The tribesman made no reply. Later, I asked him if he knew anything of the 1955 “event.” He replied that he had participated. From his distant corner of the long guest room —he was placed near the last in seating order—he began to give me a detailed account. In order to hear him better, I changed places.

At first the others ignored us, but I noticed that Hajj ‘Abd ar-Rahman was listening. Soon the room was quiet except for the tribesman. I confined my questions to those necessary to follow his narrative. Few tribesmen were anxious to speak about that event. The version given to the French and, later, to Moroccan officials (who regard the Sma‘la as a “rough” tribe to govern because they stand up to local government officials) was that the tribesmen had come to Wad Zam with peaceful intentions but subsequently “lost their heads,” having been stirred up by unidentified “outside agitators.” In this convenient formulation the question of leadership was muted. Imprecise stereotypes of a “collective” tribal mentality could be invoked to obscure individual responsibility. A week after the event, after the Foreign Legion conservatively estimated that it has killed 300 “rebels” in Wad Zam (then a town of 12,000, including 800 foreigners prior to the massacre) and another 200 in the surrounding region, a by then anachronistic collective sacrifice (t‘argiba) of twelve bulls was offered to the commander of the French forces to secure an amnesty (aman). At the end of the commander’s speech granting pardon, a squadron of military planes overflew the assembly to signify, wrote Le Monde’s reporter, French might.[5] In the twilight of Morocco’s colonial era, the incident was closed, and Wad Zam’s one claim to world attention faded into oblivion.

Throughout the tribesman’s narrative, ‘Abd ar-Rahman was silent. Then he quietly asked, “Did you come armed?” Ordinarily the Sma‘la would not have done so. “Yes,” was the answer. It did not occur to me to ask the question directly, and most Moroccans were afraid to ask. The question took the tribesman by surprise, as the qadi later told me it was intended. His one-word answer suggested prior intent, and upset the standard recital of events. Then we started the narrative all over. From what followed, it was clear that the tribal incursion was not only locally organized, but that there was a pattern in the killing that implied an attempt to identify specific targets: Wad Zam was a hotbed of the Presence franqaise, a militant settler anti-nationalist movement with its own record of assassinations and injustice.

I think that the tribesman deliberately made his account gruesome as a way of repaying the rudeness of our host. It took a special act of the sociological imagination to see how the massacre of ninety-five civilians appeared from the vantage of an enthusiastic participant. Hajj ‘Abd ar-Rahman later told me that the narrative of the bloody events of that day upset him considerably. Like myself, he sought to maintain a neutral countenance in order to hear the man out. The tribesman, however, always greeted me like an old friend whenever I saw him after that.

Much of what I describe in this book was learned from Hajj ‘Abd ar-Rahman himself. He necessarily served as my guide to the stacks of unsorted papers and notebooks which he had kept since his student days at the Yusufiya. In the course of return visits to Morocco, especially in 1976,1 managed to see much of what remained of the Yusufiya mosque-university milieu and of key persons associated with it. I was given access to some of the old student lodgings and the mosques where lesson-circles were held. I met many persons who knew Hajj ‘Abd ar-Rahman and his family, and who assisted me in placing this particular family of rural notables in a wider social and intellectual context.

Work with ‘Abd ar-Rahman quickly shattered my prior assumptions as to the “static” nature of Islamic education. His ability to question persons and interpret documents and to render intelligible complex patterns of social history impressed me. I attributed much of his spirit of critical inquiry to the early upbringing and educational tradition in which he was shaped, and began to consider this tradition, at least as it survived in Morocco through the 1930s, to be as vital as my own tradition of learning aspired to be. ‘Abd ar-Rahman was, I think, aware of my attitude.

I had previously uncritically assumed, for I had been so taught, that the special knowledge possessed by Moroccan men of learning was essentially fixed, remote from everyday life, and artificial, loosely tacked on to the implicit assumptions by which Moroccans shaped their social world and made sense of it. I began to realize how much the world of learning was an integral part of Moroccan life, this world began to feel less remote to me. I asked Hajj ‘Abd ar-Rahman systematically about his own family, upbringing, and education. Having worked closely with him on the Sharqawi papers, I was again initially attributed with more understanding than I had actually attained. Many of my questions were unfamiliar. Given my own perceptions of what constituted essential knowledge, they compelled him to go beyond the formal presentation of self (as in the tarjama) common to men of learning. His sense of history, perceptions of status, attitudes toward knowledge, and the responsibilities of men of learning toward fellow Muslims and society were issues that I felt I could understand only with a more complete idea of his own experience. By then he again had confidence that there was a pattern to my questions (to my mind often a diffuse one) and trusted me to deal with his answers with appropriate discretion.

Once, when I returned to Morocco alone in 1976, he gave me a key to his house and specifically told me that I should enter without knocking. It appeared that the only way my presence could be assimilated was to treat me (and my wife on subsequent return visits) as part of his own household. As I typed notes in one of the multipurpose rooms of his house, the women of the household sometimes entered alone and unself-consciously spoke with me. The fact that they could do so affirmed that I was quite literally taken to be part of the household.

The Mansuri household as I knew it through the mid-1970s was a warm and intense one. Most of the children have now moved elsewhere in Morocco to pursue their studies or to set up households of their own, although one son, a schoolteacher also involved in local politics, has chosen to remain in Boujad. The Hajj and his wife, Laila Malika (d. 1978), took intense pride in their sons and daughters. In spite of the formality with which husband-wife relationships are portrayed to the outside world by traditional Moroccans, the affection and mutual trust of this particular marriage was pervasive. Our experience of the Mansuri household shattered many of the preconceptions we had assimilated from our readings on the Middle East. In 1978, not long after Laila Malika's death, I returned to Boujad. Together with some of his children, the Hajj took me to see his wife's grave. One accepts God's will, so the Hajj never spoke of his grief. As one of his sons later said, he did not have to use words. I was too choked up to speak, so intense were my memories of the warmth with which we had been received over the years and the realization of what her loss meant for the Hajj. By then he had retired. His openness remained, but the elaborate, often joyous, hospitality of his household was now a past memory.

There is no easy answer to why Hajj 'Abd ar-Rahman chose to work with me. As one of his sons later said, his father never particularly liked Europeans and, as a speaker of only Arabic and tashalhit, he had limited means of communicating with them, in any case. Part of the answer lies, of course, in the common project of analyzing the Sharqawi papers, the importance of which we each understood in our different ways, but with a growing mutual respect for the questions and perceptions of the other. Our style of work and living also overlapped, at least in superficial respects. There was enough of the ascetic in me to dispense with ordinary periods of rest and eating to accomplish my self-imposed tasks. I soon learned that in addition to observing the Ramadan fast, 'Abd ar-Rahman fasted several days every month, a habit acquired from his father. Another consideration was that the qadi was engaged in identifiable scholarship in our common project. I think that he enjoyed such work as an end in itself. With me, even as a non-Muslim, he could at least temporarily pick up the threads of the world of learning he was abruptly compelled to leave when recalled by his elder brother to Bzu in 1935.

In more recent years 1 have had several opportunities to speak about my intended book with his children, now adults, and they have freely shared with me their thoughts about their father. As one of them observed, their father discussed his own youth and education with me in a detail that he did not seek to convey to his own children, although his relation with them was close, supportive, and affectionate. They are of a generation that has received a Western-style education in Moroccan government schools, in one case the palace school. For this generation, Quranic education has been little more than a preschool. Even the technical terms necessary to discuss the style of education their father received remain unfamiliar to them, as is the emphasis upon memorization of the word of God and related texts. In contrast, I was interested in the world of learning as 'Abd ar-Rahman had experienced it, and by trial and error found the questions to ask so that this world began to make sense.

A colleague, a psychoanalyst with anthropological training, suggests a complementary reason for the close ties which developed between 'Abd ar-Rahman and myself. For the qadi,

I may have taken over the role of a younger brother, allowing him to recreate the supportive relationship which he had with his own elder brother, described in the next three chapters, and at the same time pick up his commitment to learning where he left off decades earlier. He could transmit to me, as he unconsciously felt he could not to his own children, his own values and sensibilities concerning Islamic learning. I listened and judged, but also appreciated.

Each time I returned to Morocco in the 1970s, Hajj ‘Abd ar-Rahman asked if my wife and I had children yet. Just before my wife and I adopted our first child in 1978, he said to me: “It doesn’t matter. Books are the children of a man of learning.” My books have decidedly taken a form other than the preferred ones of the “sciences” (‘uliim-, sing, ‘Um’) of his tradition of origin. But his tradition of learning has allowed him to find at least partial homologies in other traditions and to respect them. As I learned through our discussions of religious studies and the Yusufiya milieu, learning how to ask questions and make sense of other traditions of knowledge was in itself a component of the mosque-university tradition.

** Two: Beginnings

The ancient towne of Bzo is built vpon a high hill ... The townesmen are honest people, exercising merchandize, and going decently apparelled: To them which inhabit the deserts they carie cloth, oile, and leather. Their mountaines abound with oliues, corne, and all kinde of fruits: and of their grapes they make euery yeere most excellent and sweete raisins. Figs they haue great plentie: and their walnut-trees are so high, that a puttocke may securely builde his nest vpon the tops: for it is impossible for any man to climbe vp. On each side of the way which leadeth from hence to the riuer Guadelhabid there are most pleasant and beautiful gardens. My selfe (I remember) was here present when their oranges, figs, and other fruits were growen to ripenes.

—Leo Africanus 1896 (orig. 152.6): n, 304

*** Bzu and Its Region

‘Abd ar-Rahman’s home from his birth until 1957 does not entirely live up to the rhapsodic description of Leo Africanus. For a piedmont (dir) village in the Marrakesh hinterland, Bzu nevertheless has a pleasant, modestly prosperous appearance in sharp contrast to the scorched villages of the Sraghna plain to its immediate south. Bzu is actually a cluster of juxtaposed hamlets on adjacent hills, located about ten kilometers south of the main highway that connects it with Marrakesh, the imperial capital and commercial entrepot for Morocco’s south. Travel to the main highway was by mule until the 1930s. Now busses leave directly from Bzu’s marketplace for Marrakesh, 130 kilometers and by bus three hours

away, and Qal‘at Sraghna, a dusty provincial capital 50 kilometers to the west. Sraghna’s expansion since the mid-1960s is linked to the massive growth of agribusiness in its immediate hinterland. Its growth sharply differs from the relative decline of piedmont villages such as Bzu, located in regions marginally suitable for modern agricultural techniques.

Until the late 1960s, many cultivators near Bzu still used camels and mules to draw irrigation water, although today small motor pumps have finally replaced most animal power. The Bzu region is given over to the herding of sheep and goats, and to orchard cultivation, principally of olives, oranges, and figs, and secondarily pomegranates and other fruits. The countryside is dry and barren for most of the year except for the irrigated orchards, although wheat and barley are grown in years when rainfall is sufficient.

Rainfall averages 400 millimeters (16 inches) annually, concentrated mostly in the months of November through April, although droughts regularly recur. Those of 1936 and 1945 enabled major local notables vastly to expand their personal holdings at the expense of tribesmen with small plots, many of whom became reluctant sharecroppers. Until the late 1960s, when money sent home by emigrant workers began to alleviate the poverty of some families, there was a substantial economic gap between a few prosperous notables and the large number of sharecroppers and tenants. In Bzu in 1969, it was still common to see sharecroppers and tenants kiss the hands of local notables, a greeting practiced further north only by sons to their fathers as an act of deference and respect. Only a few sullen, “progressive” schoolteachers posted from elsewhere in Morocco ostentatiously used the less inegalitarian handshake. A few tribesmen went so far as to kiss feet, although local notables were embarrassed by this gesture in the presence of foreign visitors.

Bzu still had a limited importance as a regional market until the late 1940s for nearby tribes of the High Atlas region and those of the plains. Olive oil is processed locally and shipped to other regions, and most of the oranges find their way through auction to markets in Casablanca and Marrakesh.

[[d-f-dale-f-eickelman-knowledge-and-power-in-morocc-4.png][Map i. Map of Morocco.]]

Until the early 1960s, one of the hamlets of Bzu was a Jewish settlement. Its economic activities included itinerant trade with outlying villages, tailoring, shoemaking, blacksmithing, and carpentry, activities now continued by former Muslim apprentices. The manufacture of large clay jars is still a local speciality, although Bzu is best known for its distinctive silk tunics (jallabas) with alternating black and white stripes, a speciality of the artisans of the region. Sultan Mulay Hasan I (r. 1873–1894) was so impressed by these tunics that he attached Bzu weavers to his entourage. The silk was locally spun until the late nineteenth century, when higher-quality thread imported from Europe undercut its production. Bzu jallabas continued to be woven locally through the 1920s (Pascon 1977:

398,414); their manufacture now survives with two old couples living inside the palace compound in Rabat, who weave them exclusively for the royal family. Women in Bzu still weave and sell for the local market the distinctive hayk Bziwi, a brightly colored blanket worn as an outer garment by rural women.

Inhabitants of the region nearly all speak tashalhit, the Berber language of the High Atlas mountains, although by the 1920s many of the men and some of the women were already fluent in Arabic. By the early 1970s only older women and a few men in outlying settlements were unable to converse in Arabic.

Bzu's economic and political ties with the rest of Morocco are shifting and complex. Since at least the late eighteenth century, the region has been firmly under Makhzan control (Tawfiq 1983). Beginning with the reign of Mulay Hasan I, the region was subject to a qaid appointed by the sultan, who resided in the High Atlas town of Damnat. Nonetheless, government presence in the region remained modest. Until almost the very end of the French protectorate (1912–1956), the religious court was held in the house of the qadi, 'Abd ar-Rahman's elder brother, who was also one of the major landowners. Today there is a small administrative center with a deputy qaid, a school, a court, and a small medical dispensary next to the marketplace.

Until the late 1960s these buildings and a few small shops next to the market were almost the only ones of outwardly modern construction. Most of the houses were adobe and mud brick. Today there are many cement houses, constructed with remittances from workers in France and other European countries. Although it is increasingly difficult to secure work in Europe and many "guest workers"—called "vacationers" (fakdns'} in local Arabic because they return to Morocco only for their annual leave—have now permanently returned to Morocco, the economic impact of remittances and exposure to life elsewhere has mitigated the more extreme expressions of status inequality in the region. By the 1980s, the kissing of hands of notables was a rapidly dying tradition, although the marks of economic inequality remain strong.

*** The Family Milieu: Origins

The Arabic literary form of the tarjama encompasses the two genres of biography and autobiography in contemporary Western literature. Knowing the highly stylized conventions of the tar jama and being able to use them to describe one's own life or the lives of others is a skill known to every man of learning. For this reason, asking a man of learning for his tarjama acknowledges his status and provides a convenient port of entry to comprehending his social world.

A tar jama is always written in the third person, even if the life described is one's own. Its components include a genealogy, an account of formal education beginning with memorization of the Quran, specific books and subjects studied, poetry, aphorisms and other contributions to learning, sons taught by the father, and the names of important pupils. Specific dates are provided whenever possible, for the ability to date events itself distinguishes the traditionally educated from the unlearned.

The tarjama represents reality in a highly stylized manner. Any element of the tar jama can be elaborated through relevant anecdotes or citations for which the exact provenance is specified. The words uttered are reported as if they were verbatim. Quotation marks are not used, and the stylistic tag, "he said to him" (qal lu) does not clearly distinguish between actual speech and paraphrase. The tarjama asserts a literal representation of words and deeds based upon credible sources.

Although the tarjama is a necessary point of departure in describing the life of a man of learning, its stylistic conventions render it incomplete. No women are mentioned in it, so the family and household context in which early learning occurs is difficult to comprehend. Likewise, although teachers are mentioned, peer learning does not form part of the convention of the tarjama and is passed over in silence, as are politics and economic transactions, subjects that occupy a not insignificant amount of time for many men of learning.

Tarjamas of Moroccan men of learning in the late nineteenth and early twentieth centuries suggest the pervasive importance of close relatives in shaping their attitude toward learning. Mukhtar as-Susfs al-Ma'sill (1961), a compendium of such biographies for Morocco's Sus region, famous for its scholars, indicates that men of learning most often come from households in which the father or another close relative is already literate and takes an active role in teaching Quranic recitation or encouraging its study (e.g., as-Susi 1961: ix, 3536, 101, 168).

Mansur bin Ahmad (d. 1946), 'Abd ar-Rahman's father, was closely involved in the early education of his sons. Mansur had three sons and a daughter by Fatima, his first wife and 'Abd ar-Rahman's mother. Mansur divorced Fatima when 'Abd ar-Rahman was about five years old, and she left Bzu to return to her father. The eldest son was Ahmad (1312/ 1894–1895—1975), followed in order of birth by 'Abd ar-Rahman (1330/1912-), Zahra (c. 1914-1344/1925), and Muhammad (c. 1915–1978). He also had three sons and three daughters from Batul, his second wife. The daughters by both marriages remained illiterate, but all his sons by the first marriage studied at the Yusufiya, and two of them completed their studies with distinction, as did two of the three sons by his second marriage.[6] Batul's youngest son, 'Abd al-Kablr, born in the mid-19 3 os, was the only one not to receive a traditional education. Traditional religious studies had declined by the time he was ready for school, so he entered a government school instead. Soon after independence in 1956 he became a primary school teacher.

‘Abd ar-Rahman knows little of his father’s origins. Mansur rarely spoke of the subject to his children. Hence what they know of their father derives largely from what they observed and later discovered for themselves. Unlike many Moroccans, ‘Abd ar-Rahman says he also knows little of his maternal relatives, although a maternal uncle taught him part of the Quran and was influential in his early education. His claim to know little of them, like the claim that he never visited his mother after her divorce because of the difficulty of travel, may relate more to the tensions present in the household of his youth than to actual circumstances.

Some religious figures and men of learning assert long genealogies linking them to famous ancestors or the house of the Prophet (Eickelman 1976: 183–2.10). ‘Abd ar-Rahman’s legal studies and sense of self led him to claim descent only from ancestors he could verify. Thus his “chain” of descent stopped at the level of his paternal grandfather. For ‘Abd ar-Rahman, it is more important for a man of learning to assert only verifiable descent than to speculate over possible antecedents, even when suggested by other men of learning. He recalled three childhood incidents that fed his curiosity as to his father’s origins. On one occasion, a descendant of the Prophet (shrtf-, pl. shurfa) visited his father and asked him to visit his other shrif relations in Ait Shitashin, a tribe in the High Atlas mountains. Mansur declined the invitation. ‘Abd ar-Rahman explained that such a journey would have been extremely arduous in the early part of this century. There were still no roads into the High Atlas mountains, and the region was outside the sphere of effective colonial control.

**Table 1. The Descendants of Mansur B. Ahmad of Bzu (d.1946)
(most dates are approximate)**

| Children | Children’s Spouses, Grandchildren, and Great-Grandchildren in 1978 |

| By his first wife, Fatima B. al-Kabir
(divorced 1917, d.1928) |

| 1. Ahmad (1895–1975), Yusufiya student (1913—1918), notary and scribe for French Native Affairs officers (1919—1925), qadi of Bzu (1925–1953), qaid and qadi of Ntifa (1956), qadi (1956–1957), member of Constitutional Council (i960), member of parliament (1963). | First wife-, daughter of a Bzu shaykh (m.1920, d.i93os). Children: Muhammad al-Kabir (1926–). Yusufiya dropout; oversees father’s estates. Married; childless.
Muhammad as-Saghir (1939–). Qarawiyin

dropout. Works with elder brother. Married a soldier’s daughter, Bni Millal. Four sons, two daughters.
Second wife: Daughter of protectorate qaid of Bzu (m.1935, d.1960s).
Children: One daughter, Fatima, married to a court clerk. |

| 2. ‘Abd ar-Rahman (1912–), Yusufiya student (1928–1935), deputy qadi of Bzu (1935–1953), qadi of Boujad (1957—1969), elsewhere (1969–1975). Pilgrimage to Mecca, 1960. | Wife: Laila Malika (m.1941, d.1978). Sister of Ahmad’s second wife.
Children:
Hasan, inspector of finance. Married, three children. Casablanca. Mukhtar, accountant. Married, two small children.
Habiba, married. Husband is provincial director of education. Four children.
‘Abd al-Ghani, secondary school teacher, member of municipal council, Boujad.
al-Ha;i, student.
Yasin, formerly student at Palace school, now in university, Rabat. Fatima Zahra, student.
Three other children who died as infants, Bzu; two in Boujad. |

Table I (cont.)

| Children | Children’s Spouses, Grandchildren, and Great-Grandchildren in 1978 |

| 3. Muhammad (1915–1978), Yu-sufiya dropout, notary. | Wife: Daughter of a local shaykh. Several small children.
Husband: From Bzu. One son, a cupper (hajjdm), two daughters. |

| 4. Zahra, d.192.5. |

| By his second wife, Batul bint Salah |

| 1. ‘Abd al-Hayy (1922–1977), Yusufiya student to 1935, then Qarawiyin (1937–1949). Scribe, Ministry of Justice, Rabat (19491956), qadi in Damnat (19561959), as-Swira (1959–1962). Examining magistrate, Marrakesh (1962–1974), qadi (1974–1977). Pilgrimage in 1968. | Wife: From Bzu.
Children: One daughter (1959–), English teacher, Marrakesh. Three sons; one is a merchant, two are students. |

| 2. ‘Abd al-‘Aziz (d.1936), had just begun studies at Yusufiya. | |

| 3. Mina (d. 1930s). | Husband: ‘Umar, a fqih from Bzu.
Children: A son, now teaching in Rabat. Two daughters; one died young, the other is married and living in Bzu. |

| 4. ‘Abd al-Kabir (1935–), primary school teacher, near Bni Mallal. | Wife: Unknown.
Children: Several. |

| 5. ‘Aysha | Husband: From Bzu.
Children: One daughter, Bzu. |

| 6. Fatima | Husband: Brother of a qadi.
Children: Unknown. |

On another occasion, tribesmen claiming to be “close” (qrib’j to his father visited Bzu.[7] Pointing to Ahmad, they said that one day he would become a great man. The implication of this account is that the visitors, by prescient allusion to Ahmad’s future success, may have claimed powers sometimes attributed to descendants of the Prophet. If they were shurfa and their claims of “closeness” with Mansur were valid, then of course Mansur could also claim descent from Muhammad. Finally, in the 1940s, by which time the Mansuris had long been established as prominent rural notables, a scholar from Marrakesh visited them on the pretext that he had managed to trace their lineage back to the Prophet. His intent was to be rewarded financially for the effort, which the Mansuri brothers declined to do although he was honored as a guest. ‘Abd ar-Rahman cautioned me to regard these incidents as “just so” stories.

How Mansur settled in Bzu and established ties in the region remains unclear. Mansur told his sons that he came from Tagharat, a Berber village “above” Damnat in the High Atlas mountains. Neither ‘Abd ar-Rahman nor his elder brother ever visited the village. However, Mansur once told Ahmad that a major land dispute broke out between two tribal groups in Tagharat. Mansur’s father, Ahmad, had been warned to come down to Bzu to avoid being attacked. He ignored the warning, so one night four marauders broke into his house, killing him and plundering his belongings. Mansur managed to escape to Bzu, together with his son Ahmad, then barely forty days old, hidden in his tunic. The incident is indirectly datable. In Ahmad’s tarjama, written in 1962, at the request of a schoolteacher from another region of Morocco assigned to Bzu, he gives the year of his birth as 1312/1894-1895. This incident may have been another compelling reason that Mansur declined to return to his village of origin later in his life.

Marriages among rural notables in the first part of this century were strategically calculated political events. One of Mansur’s sisters married a rural shaykh of the Bzu region whose family had held the shaykhship since the mid-nineteenth century. Mansur’s first wife and ‘Abd ar-Rahman’s mother, Fatima, was daughter of a rural shaykh from Tamannt, a village about fifteen kilometers distant from Bzu on a difficult mountain path. These marriages suggest that Mansur had some sort of claim to notable status and a specific link to the Bzu region prior to his sudden flight from Tagharat. Yet the matter remains unclear. His younger sisters all married Quranic teachers or literate men—the term fqth covers both — in the Bzu region, one of whom was a messenger for Sultan Mulay Hasan I. Mansur’s only brother, Muhammad, described by ‘Abd ar-Rahman as “tough and harsh” in temperament, joined the Spanish army in the Rif in the 192.0s, served with Franco’s forces in the Spanish Civil War, and remained in the Spanish army until 1950, when he retired to Bzu and died there a few years later. Muhammad claimed that his wife, from Morocco’s Spanish zone, was a descendant of the prophet (shnfa), another assertion regarded as unverifiable by ‘Abd ar-Rahman.

More certain is the fact that by the time of ‘Abd ar-Rahman’s birth in 1330/1912, Mansur had become a minor landowner in the region and was respected throughout the region for his stern piety. Because of his dual reputation for piety and hospitality, Mansur often entertained men of learning and religious figures as they passed through Bzu. He was an adherent of the Kittaniya religious order (tariqa). He regularly set aside a few days each month for fasts supplemental to that incumbent upon all Muslims in the month of Ramadan, made a personal prayer (da‘wa) before every meal and, when not engaged in conversation, moved his lips in silent recitation of the Quran. These practices are still common among pious Moroccans, but Mansur adopted other practices now deemed religiously questionable. Every afternoon, as he sat in the courtyard of his house in Tagunnt, the hilltop hamlet in Bzu where his house was located, he struck a sharp rock rhythmically against his head and forearms, often drawing blood. During ‘Abd ar-Rahman’s youth, this was a practice common to members of the Kittani order.

From today’s vantage point, Mansur’s personal piety may appear part of a “traditional” practical religion with no certain temporal dimension. At least for the Bzu region, the Kittani practice of self-mortification was an early twentieth-century innovation. Self-mortification was practiced by other religious orders such as the Haddawa (Brunel 1955) and the Hamadsha (Crapanzano 1973), but not by religious orders such as the Kittaniya, which attracted notables as adherents. Mansur’s style of religiosity marked an era, for none of his sons joined the Kittaniya or adopted any of the practices identified with religious orders. Although the sons avoided direct confrontation with their father, they flatly considered selfmortification to be beyond the pale of Islamic practice. Their generation was one heavily influenced by reformist Islam, which considered religious orders and their practices as distortions of Islam. Nonetheless, the Mansuri brothers were their father’s sons in other respects. From their youth they performed supplemental fasts, recited invocations before meals, and moved their lips in recitation of the Quran when not engaged in conversation.

Mansur’s piety gave him a quasi-maraboutic status among the tribesmen of the region. He often was called upon to mediate local disputes. From 1916 until his death from typhus in 1946 he was prayer-leader (iwam) at the principal mosque in Bzu, and until the French reformed the notarial system in the early 1920s he served as notary. He wrote whatever documents tribesmen requested of him in the marketplace or wherever he happened to be. As was the practice prior to the French reforms, he kept no copy or register of documents that he prepared, nor did he ask a fee. If grateful tribesmen gave him money, he disbursed it as alms to children and the poor at the market. Once French reforms were implemented, the documents he prepared were no longer regarded as legally valid; the French never granted him notarial status. Nonetheless, tribesmen unaware of the fact continued to seek his services until his death. Ahmad, after he became qadi of Bzu in 1344/1925, quietly avoided confrontation with his father by redoing without payment his father’s documents in acceptable form. Mansur never learned of his son’s emendations. To his death, he thought that he had successfully avoided the strictures placed upon him by French rule.

Two incidents indicate Mansur’s stature in the region and also suggest the nuances of successful adjustment to colonial rule. In 1338/1919 Ahmad was engaged by the French to

make an inventory of all pious endowment (abbas) lands in the Ntifa region, of which Bzu formed a part. In that same year the French began to implement the rural tax (tartib). Since this was a non-Islamic tax, tribesmen resisted paying in many regions. Like many other educated persons in rural Morocco, Ahmad was obliged by the French to cooperate with the qaids and shaykhs, many of whom were illiterate, in establishing the system. In Bzu the tax was at first paid in kind. To avoid resistance to its payment, Ahmad arranged for his father's house to be used as a collection point for the produce. As a consequence, resistance to imposition of the new tax was minimal because most tribesmen assumed that they were making a religiously sanctioned tithe ('ushur).

The second incident occurred in 1925. The government-appointed shaykhs and headmen (mqaddims) of the Bzu region, together with Mansur, were called to a meeting at the weekly Bzu market with the new qaid of Ntifa, Si Muhammad bin 'Abd Allah ash-Shtiwl. The qaid, an illiterate, raised publicly the issue of a contested property title (rasm) that Mansur had prepared. It was common knowledge that documents prepared by him were invalid. The qaid looked briefly at the document, which he pretended to read, then handed it back to Mansur, saying that it was improperly executed. Mansur bluntly asked the qaid: "And just what do you know of Islamic law? Absolutely nothing." The qaid slapped Mansur and curtly ordered him to leave the assembly. Mansur did, but immediately sent a messenger to his eldest son with a letter, asking him to return immediately to Bzu. In the meantime, friends of the qaid informed him that Mansur and his elder son were the two most influential men in Bzu, and that the incident might spark a local uprising that would call the qaid's ability to govern into doubt. Once Ahmad returned to Bzu — he had been working elsewhere as a scribe (then an influential post) for a French Native Affairs officer—he arranged an uneasy truce (sulh) between the qaid and his father. From that time on, the qaid sought to better his relations with the Mansuri family. The qaid supported appointing Ahmad as overseer (nadir) of pious endowments that same year, and his appointment as qadi a few months later.

*** A Qadi's Childhood

The first step in acquiring an Islamic education in Morocco is memorization of the Quran and its proper recitation. 'Abd ar-Rahman first entered the mosque-school (msid), at the age of four, just before his mother left the household, and became a "memorizer" (hdfid) around 1924. Mansur was as stern with his sons in disciplining them to memorize the word of God as he was with himself. 'Abd ar-Rahman recalled:

What I remember most of my childhood is the cane. When we were young, my brothers and I were beaten three times daily by my father: morning, noon, and night. Each night he required us to stand before him and recite five hizbs of the Quran.[8] Other children were only expected to recite one. If we made a mistake, then we would be beaten again.

At no time throughout our discussions did ‘Abd ar-Rahman indicate resentment over such beatings. On the contrary, he says that the beatings were a sign of his father’s concern for him and his other brothers. As he emphasizes, his father never beat him in anger. Another Moroccan educated in this tradition has shown me the scars encircling his neck from where his father regularly twisted his flesh whenever he made a mistake in recitation. In this case as well, the father’s actions were described as proper concern for conveying the word of God to the son, not as cruelty.[9]

The patterns of domestic authority in the households in which ‘Abd ar-Rahman matured are central to his early memories. As was common with other families of notables, the households in which he grew up—there were several—each consisted of several conjugal couples and their children. Frequent shifts in the membership of these households were not uncommon.

When ‘Abd ar-Rahman was five, Mansur took a second wife, Batul. This radically altered the household, for Fatima was adamantly opposed to the second marriage and returned to her father’s house in Tamannt. She took her daughter, Zahra, with her, but was compelled to leave her sons behind. Soon afterward she was divorced. ‘Abd ar-Rahman saw her only once more before she died in the late 1920s.

His mother’s departure was a significant loss. In common with other educated Moroccans of his generation, ‘Abd ar-Rahman did not dwell upon his “inner” feelings or elaborate upon the psychological consequences of separation from his mother. Even in speaking of women we had radically departed from the conventions of biography.Yet his choice of recollections suggests a sense of profound loss. In practical terms, ‘Abd ar-Rahman and his younger brother (Ahmad had already left Bzu to pursue studies in Marrakesh) were left in a household with a young stepmother, unsure of her status because she was still without children of her own. She was hostile toward the children of Mansur’s first marriage from the start. Her attitude did not soften after she bore her own children, who in birth order were ‘Abd al-Hayy (1922–1977). ‘Abd al-‘Azlz (d. 1936), Mina (d. 1930s), ‘Abd al-Kabir (c. 1935–), ‘Aysha and Fatima. ‘Abd ar-Rahman remembers sitting in the courtyard when his stepmother came up behind him with a bucket of filthy washing-water which she poured over his head. He says that such incidents were common. Even if his recollection of this incident is highly selective, it probably conveys accurately how he felt at this time in his life. Mansur continued his strict supervision of his sons’ Quranic studies, but left household matters to his second wife.

A comparison with the seventeenth-century Moroccan scholar, Sidi al-Hasan al-Yusi, also born in a rural milieu, serves to place ‘Abd ar-Rahman’s childhood trauma in perspective. Berque (1958: 10) comments that the death of al-Yusi’s mother in his early childhood was a shock that “emptied the home and discolored the universe,” with the consequence that al-Y’usi intellectualized his loss and took refuge in his studies.

Given the vicissitudes of natural circumstances and the facility with which divorce can be accomplished, many Moroccans experience the loss of a parent in childhood.[10] A mitigating factor, much less present in situations in which nuclear families are separately housed, is that several relatives often share responsibilities for raising children. This was the case for ‘Abd ar-Rahman. After his mother’s divorce, ‘Abd ar-Rahman often stayed for weeks on end at the nearby house of a maternal uncle, Muhammad bin al-Kabir Abarrah, who was also one of his Quranic teachers. Perhaps indirectly recognizing the tense situation in his own household, Mansur intermittently gave small gratuities to this uncle until his death in the early 192.0s, in recognition of his role in ‘Abd ar-Rahman’s education and upbringing. ‘Abd ar-Rahman’s elder brother later took over this role.

In 1918, when Ahmad returned temporarily to Bzu and resided in his father’s house, his presence and forceful personality restrained Batul’s cruelty. ‘Abd ar-Rahman says that she was afraid of him. When Ahmad returned from Marrakesh, Mansur built a small mosque within the compound of his house. There ‘Abd ar-Rahman continued his memorization alongside his younger half-brothers, ‘Abd al-‘Aziz and ‘Abd al-Hayy.

*** His Brother’s Footsteps

Ahmad’s career framed that of ‘Abd ar-Rahman. Not only did ‘Abd ar-Rahman admire his elder brother; his elder brother’s decisive influence in local politics defined his practical possibilities until the end of the colonial era.

Although Ahmad was only eight years older than ‘Abd ar-Rahman, he belonged to a generation of men of learning who came to maturity just as the machinery of the protectorate was set into place. Some opportunistically realized the possibilities open to them through collaboration. Others, although displeased with French rule, saw no realistic alternative to working within the system being established by the French. Only a few chose openly to resist the French (see Hamtnoudi 1981). Ahmad, a devout Muslim and courageous in his own right—the French awarded him a medal—was a realist.

Ahmad completed memorizing the Quran in 1328/1911. Soon afterward he left Bzu to study with Muhammad bin ‘AF al-Mshabbkl, a scholar who taught religious studies to a fluctuating number of ten to twenty Berber-speaking students in a tent school at Dawwar Mshabbak, located twelve kilometers south of Bzu. ‘Abd ar-Rahman was to attend this same school a decade later. Such tent schools were especially common among Berber scholars, who had first to acquire sufficient skill in Arabic in order later to pursue studies at such centers of higher learning as the Yusufiya. The school at Dawwar Mshabbak was sophisticated enough that in addition to teaching the religious sciences, one of its teachers during Ahmad’s stay there also taught elementary arithmetic, at the time a curricular innovation.[11]

In 1331/1913, Ahmad left the Bzu region for the Yusufiya, where he remained until 1336/1918. Upon his return to Bzu in that year, he set up a school (madrasa) of his own in his father's house, where he fed and clothed a fluctuating number of six to twelve religious students (tulba-, s. talib), characterized by 'Abd ar-Rahman as mostly impecunious blacks from southern Morocco.

In 1338/1919 Ahmad again left Bzu under orders to assist the French Native Affairs officer responsible for Ntifa. He also received a military medal that year from the French, the Ouissam al-Harb, a fact omitted from his 1962 tarjama, for his aid in pacifying the Ait 'Tab (Ait Attab), a large tribe near Azilal. He also became a notary in 1919, at the time a significant post, especially for a youth of twenty-four. As miniscule as the rural administrative apparatus that was elaborated in the first years of the colonial era retrospectively appears, it constituted a major expansion over precolonial local administration. Many of the Moroccans to participate in colonial administration from the outset were quickly promoted to posts that secured their prominence as regional notables in the years to come. Ahmad bin Mansur was one of them.

In 1920 Ahmad returned once again to Bzu, already a prominent local notable despite his youth. Although he at first lived once again in his father's house, he was aware of the serious potential for conflict. Ahmad had begun to eclipse his father in importance, because Mansur was unsuccessful in adapting to the changed circumstances of colonial administration. Although Mansur continued to be highly respected, an increasing stream of visitors came primarily to see Ahmad. Recognizing the delicacy of the situation, Ahmad began construction of his own house, some 800 meters away from that of his father's. It was completed in 1923. From that time on, 'Abd ar-Rahman spent most of his time at his brother's house.

In 1343/1924-1925, Ahmad was called away again by the French to become secretary to the French officer in Azilal assigned to the Ait 'Tab. He at first refused, but was obliged to accept the assignment for a year. He took 'Abd ar-Rahman along with him. In the third-person usage characteristic of tarjamas, one of which 'Abd ar-Rahman prepared at my request in 1976, he records that his brother placed him in the care of a renowned teacher among the Ait 'Tab, "one of God's people" (min ahi Allah), who supervised his studies in a mosque-school "which attracted a large number of students. [The teacher] slept little in the night; instead, he praised God. This teacher favored the fqih 'Abd ar-Rahman [over other students] to accompany him in the dawn prayers." Although 'Abd ar-Rahman had not yet completed memorization of the Quran, he began parallel memorization of the Ajdrumiya, a compact grammar in verse.[12] He also began memorizing the Alfiya of Ibn Malik (d. 672/1274). This book is a grammar in one thousand rhymed verses judged by Berque (1949: 75) to be so compact as to be obscure and often unintelligible. Both these treatises were recognized as beginner's texts (al-mabadi'), commonly the first books after the Quran to be memorized by students (as-Susi 1961: ix, 101). Since these texts and certain others were memorized by all educated men, there was no ambiguity in

the common practice of referring to them by title only. Although these two books are not memorized with the same care as the Quran, rural men of learning often lace verses from them into their conversations and vie with one another to recall their verses.

From 1925 until early 1927, ‘Abd ar-Rahman returned to Bzu, where he studied alongside his half-brothers in his father’s house. He continued memorization of the Quran, the Ajarumiya, and the Alfiya, and in addition began memorization of Ibn ‘Asim’s (d. 1426) Tuhfat al-Hukkdm, a chapter handbook of practical jurisprudence with 1,679 verses. He also was introduced to the Mukhtasar of Khalil ibn Ishaq (d. 1378), the staple summary of the Maliki school of jurisprudence in Morocco and cornerstone to the mnemonic culture of Moroccan men of learning. His activities were confined to memorizing these texts. Only later, as we shall see in the next chapter, did he acquire an understanding of what they meant.

** Three: The Education of a Qadi: The Quranic Presence

*** Islamic Knowledge in Morocco

Why should some children spend years memorizing the Quran? The cultural idea of religious knowledge has remained remarkably constant over time throughout the regions of Islamic influence. Writing specifically of medieval Islamic civilization, Marshall Hodgson states that education was “commonly conceived as the teaching of fixed and memorizable statements and formulas which could be learned without any process of thinking as such” (Hodgson 1974: 438; emphasis added). The last phrase raises the crucial issue of the meaning of “understanding” associated with such a concept of knowledge. The “static and finite sum of statements” (ibid.) conveyed by education constitutes the religious sciences, the totality of knowledge and technique necessary in principle for a Muslim to lead the fullest possible religious life. They also constitute the most culturally valued knowledge (cf. Rosenthal 1970). The paradigm of all such knowledge is the Quran, considered literally to be the word of God; in Morocco its accurate memorization in one or more of the seven conventional recitational forms is the first step in mastering the religious sciences through “mnemonic possession” (malakat al-hifd}.[13] The memorization of key texts just as the Quran is memorized is also the starting point for the mastery of the religious sciences. To facilitate this task, most of the standard treatises used by Moroccan men of learning are written in rhymed verse.

Historians and sociologists have tended to take at face value the ideological claim in Islam of the fixed nature of religious knowledge. Consequently, not much attention has been given to a more critical analysis of how such a system of knowledge is affected by its mode of transmission and its linkages with other aspects of society. Thus, educated Muslims consider all bodies of knowledge that elucidate the “high words” (al-klam (al-‘ali) of the Quran and the traditions of the Prophet to comprise the religious sciences. Normatively

speaking, the emphasis in transmitting this knowledge is conservational, especially in Morocco. Even Ibn Khaldun (d. 1406) noted that the role of memory was stressed more in Morocco than elsewhere in the Islamic Middle East. It took sixteen years to acquire sufficient mastery of texts to teach on one's own in Morocco, owing to the necessity of memorization, but only five in Tunis (Ibn Khaldun 1967: n, 430–431). Given this emphasis, it is not surprising that contemporary Muslim and European scholars have expressed the most extreme opinions about Moroccan traditional education. Writing with a firsthand knowledge of the Qarawiyin of sixty years ago, a distinguished French historian and Arabist noted the "astonishing" (to a European) domestication of the memory involved in Islamic higher education. He claimed that it deadened the student's sense of inquiry to the point that the knowledge and comportment of twentieth-century men of learning could be assumed "without fear of anachronism" to be exact replicas of their predecessors of four centuries earlier (Levi-Provencal 192.2: 11). More recently, a Western scholar has written of the "stifling dullness" of Islamic education (L. C. Brown 1972: 71) and another, indicating perhaps an impatience with the unfamiliar principles upon which traditional Islamic education is based, claims that it "defies all [sic] pedagogical technique" (Berque 1974: 167). Islamic education fares no better in the hands of Western-educated Muslims, who write of it as a "purely mechanical, monotonous form of study" (Zerdoumi 1970: 196; also Hussein 1948).

Such common assumptions effectively mask the variety of Islamic educations—I deliberately use the plural—in different cultural contexts and historical periods. In my own experience, men of learning in Oman have listened in astonishment and occasional disbelief when I have stated that their counterparts in Morocco and even village Quranic teachers know the Quran by heart. In Oman, its proper recitation suffices. Moroccan scholars, for their part, show an equal astonishment to learn that they have counterparts elsewhere in the Islamic world who do not possess the Quran and other basic texts by memory. In twentieth-century Iran, there is much more formal dialogue between teachers and students as an ordinary component of higher education than is the case for Morocco, where such exchanges occurred principally in peer learning and private discussions. The presumption that Islamic learning in Morocco was merely a decayed form of the formal disputanda of some versions of "classical" and contemporary Islamic education is to neglect the diversity of this vital and complex tradition and favor description of those aspects of it, especially formal dialogue, that are more immediately appreciated by contemporary Western scholarship (Fischer 1980b; 1982; Makdisi 1981).

*** The Social Context of Religious Learning

Sixty years ago, literacy in rural Morocco necessarily implied religious schooling, although schooling did not necessarily imply literacy. The first years of study consisted of memorizing and reciting the Quran; only at later stages did more advanced students learn to read and write, and then usually outside the context of the mosque school. Contemporary literacy is difficult to measure, let alone the literacy rates of earlier periods, but estimates are essential to indicate the scale of traditional education. For the 1920s and 1930s it appears reasonable to assume that a maximum of 4 percent of the adult male rural population was literate,

allowing for regional variations, and perhaps 10–10 percent of the adult male urban population (Hart 1976: 183; H. Geertz 1979: 470–487; Brown 1976: 107). The rural estimate is appropriate to Bzu, where the uses for literacy outside of Quranic recitation included chiefly the ability of agricultural overseers to keep accounts for absentee landlords and write simple narratives of events in a rough and ready colloquial Arabic. Merchants and traders also had use for a limited literacy in corresponding with their suppliers elsewhere in Morocco. Quranic teachers sometimes wrote amulets and charms. A more complete literacy was required only by notaries, who had mastery of conventional legal formulas. Only a handful of persons possessed the self-consciously ornate literary style eventually mastered by ‘Abd ar-Rahman. Arabic was an established second language in Bzu, Tasha-Ihit was not used in written communications and records.

Religious learning was popularly respected. Some accounts of Morocco have postulated a sharp distinction between urban and rural religious practices. This is a difficult distinction to maintain. It has long been recognized that virtually every rural local community (dawwar) and traditional urban quarter is socially distinguished by a maraboutic shrine and ties with one or several maraboutic figures (Castries 1924; Jemma 1972; Eickelman 1976: 97, 102–103, m-113). In the 1920s, as today, virtually every urban quarter and rural local community maintains a mosque school for which a teacher (fqih) was contracted on an annual basis to teach and to perform certain other religious services for the community.[14] Few of these teachers are supported by pious endowment funds in urban contexts and almost none in rural ones. Their maintenance consequently indicates current and sustained community support. In rural contexts these schools often consisted of no more than an ordinary tent or rural hut (nwala), distinguishable from other dwellings only by a small flag run up on a pole. The modest stipend for teachers was often partially paid in kind, with even meals being prepared on a rotational basis by members of the community.

Most Moroccan males and a fair number of females, at least in towns, attended Quranic schools long enough to commit to memory a few passages of the Quran, but Quranic schools were characterized by a high rate of attrition. Most students left before they acquired literacy. Few remained the six to eight years that were generally required to memorize the entire Quran.[15]

The formal features of Quranic schools have been frequently described (e.g., Michaux-Bellaire 1911), although the specific consequences of their form of pedagogy upon modes of thought have only begun to be critically explored (see Wagner 1978, 1983; Wagner and Lotfi 1980). The Islamic emphasis upon memory is not unique, as has been implied by some scholars. Elaborate mnemonic systems were developed in classical Greece and Rome, which facilitated memorization through the regular association of “material with “memory posts,” visual images such as the columns of a building or places at a banquet table (Yates 1966: 2.-7). Accompanying such techniques was the notion that mnemonic knowledge was “purer” than that communicated through writing (Notopoulos 1938: 478). What is remarkable about the use of memory in the context of Islamic education in Morocco is not the performance of “prodigious” mnemonic feats, therefore. Such feats were fully paralleled in Europe (Yates

1966). Rather, it is the insistence by former students that there were no devices to facilitate memorization. Although ‘Abd ar-Rahman and most other former students can recall being able to visualize the shape of the letters upon their slates and even the circumstances associated with the memorization of particular Quranic verses and other texts, such potential mnemonic cues were not formally expressed, perhaps for the implicit reason that their use would associate extraneous images with the word of God and thus dilute its transmission. Although students deny the existence of mnemonic devices, Wagner (1978: 14) suggests that patterns of intonation and rhythm systematically serve as mnemonic markers.

A typical fqih had between fifteen and twenty students in his charge at any time, ranging in age from four to sixteen. No printed or manuscript copies of the Quran were used in the process of memorization. Each morning the fqih wrote the verses to be memorized on each student’s wooden slate (lilh). The child then spent the rest of the day memorizing these verses by reciting them out loud, as well as systematically reciting verses that had been previously learned. Some students, such as ‘Abd ar-Rahman, also laboriously traced the fqih’s letters with a quill pen and an ink made locally of burned wool and charred sheep’s horn.

Two features consistently associated with Islamic education are its rigorous discipline and the lack of explicit explanation of memorized material. Both of these features are congruent with the concept of essentially fixed knowledge which is at the base of Islamic education, at least in the Moroccan context, and the associated concept of “reason” (,‘qal) prevalent in Moroccan society. Reason is popularly conceived as man’s ability to discipline his nature in order to act in accord with the arbitrary code of conduct laid down by God and epitomized by such acts of communal obedience as the fast of Ramadan (see Eickelman 1976: 130–138). Thus a firm discipline in the course of learning the Quran is culturally regarded as an integral part of socialization. This underlying popular attitude toward learning is one of the reasons why it is inappropriate and misleading to see Islamic education as a “high tradition” grafted upon or independent of more popular implicit understandings of religion and society, as has been done by an earlier tradition of Orientalist and anthropological scholarship. In Moroccan towns and villages, the discipline of Quranic memorization is an integral part of learning to be human and Muslim.

When a father handed his son over to a fqih, he did so with the formulaic phrase that the child could be beaten as the fqih saw fit. Such punishments were considered necessary for accurate Quranic recitation of the word of God. Former students explained that the fqih (or the student’s father, when he participated in supervising the process of memorization) was regarded as only the impersonal agency of the occasional punishments which, like the unchanging word of God itself, were merely transmitted by him. Moreover, as ‘Abd ar-Rahman and others explained to me, students were told that any part of their bodies struck in the process of Quranic memorization would not burn in hell. (The same notion popularly applied to beatings which apprentices received from craftsmen [m’allmm dyal l-harfa], including musicians, since music is popularly considered to be a craft [Schuyler 1979: 21–17]). In practice, students were slapped or whipped only when their

attention flagged or when they repeated errors, although my impression from contemporary mosque schools is that the children of high-status fathers are struck much less frequently than other children.

Former students emphasized that throughout the long process of memorizing the Quran, they asked no questions concerning the meaning of verses, even among themselves, nor did it occur to them to do so. Their sole activity was memorizing proper Quranic recitation. It should be kept in mind that the grammar and vocabulary of the Quran are not immediately accessible to speakers of colloquial Arabic, and are even less so to students from Berber-speaking regions; ‘Abd ar-Rahman, together with other former students, readily admitted to not comprehending what he was memorizing until fairly late in his studies (see also Hart 1976: 85; Waterbury 1972: 32). Only after ‘Abd ar-Rahman had memorized the entire Quran did he hesitantly begin to converse in Arabic.

“Understanding” (fahm) was not measured by any ability explicitly to “explain” particular verses. Explanation was considered a science in itself to be acquired only through years in the advanced study of exegetical literature (tafsir). Any informal attempt to explain meaning was considered blasphemy and simply did not occur. Instead, the measure of understanding was implicit and consisted in the ability to use particular Quranic verses in appropriate contexts. In the first few years of Quranic school, students recalled that they had little control over what they recited. They could not, for instance, recite specific chapters of the Quran if asked to do so, but had to begin by one of the sixty principal recitational sections. Firmer control was achieved as students accompanied their father, other relatives, and occasionally their fqih to social gatherings. On such occasions they heard adults incorporate Quranic verses into particular contexts and gradually acquired the ability to do so themselves, as well as to recite specific sections of the Quran without regard for the order in which they had memorized it. Thus the measure of understanding was the ability to make appropriate practical reference to the memorized text, just as originality was shown in working Quranic references into novel but appropriate contexts in conversation, in sermons, and on formal occasions. Knowledge and manipulation of secular oral poetry and proverbs in a parallel fashion is still a sign of good rhetorical style; the skill is not confined to religious learning (Geertz 1983: 112–113).

The high rate of attrition from Quranic schools supports the notion that mnemonic “possession” can be considered a form of cultural capital (Bourdieu 1973: 80). Aside from small customary gifts given by the parents of children to the fqih, education was free. Yet most students were compelled to drop out after a short period in order to contribute to the support of their families or because they failed to receive familial support, as did ‘Abd ar-Rahman, for the arduous and imperfectly understood process of learning. In practice, memorization of the Quran was accomplished primarily by the children of relatively prosperous households or by those whose fathers or guardians were already literate. I say primarily, for education was still a means to social mobility, especially if a poor student managed to progress despite all obstacles through higher, post-Quranic education (cf. Green 1976: 218–221).

The notion of cultural capital implies more than the possession of the material resources to allow a child to spend six to eight years in the memorization of the Quran; it also implies a sustained adult discipline over the child. Many contemporary Western pedagogical concepts treat education as a separable institutional activity, but this idea is inappropriate to learning in the traditional Islamic context.[16] Students' fathers, elder brothers, other close relatives —including women in some cases (e.g., Waterbury 1972: 31–32)—and peers, especially at later stages of learning, were integrally involved in the learning process. These all provided contexts in which learning could continue. Even for urban students from wealthy families, formal education did not involve being systematically taught to read and write outside of the context of the Quran. Students acquired such skills, if at all, from relatives or older students apart from their studies in Quranic schools (Berque 1974: 167–168), just as they acquired a demonstrated understanding of the Quran through social situations in which Quranic verses and other memorized materials were used.

*** Carriers of the Quran

A student became a "memorizer" (hafid) once he knew the entire Quran; its memorization gave him a special status in ordinary society.[17] During a child's memorization of the Quran, there was periodic public recognition of his progress. The Quran is composed of four quarters {silkas, lit. "threads") of fifteen hizbs each. After successful memorization of each quarter, a child's household was expected to offer a feast to which the teacher, neighbors, and others were invited. The largest celebration was reserved for memorization of the entire Quran, when the student would often be mounted on a gaily decorated mule (as was 'Abd ar-Rahman in 1927–192.8) or horse for a celebratory progression through his town or village, accompanied by musicians, other students, and ululating women. Through the 1960s, such celebrations accompanied the awarding of diplomas in government schools. Now that education no longer guarantees employment or high status, the practice has fallen off.

In the precolonial era, fqihs, religious students, and Jewish traders, who themselves had a separate, distinctive role (Eickelman 1983), often were the only strangers who could travel in safety through tribal regions without making prior arrangements for protection. This special status was especially pronounced in rural and tribal milieus, where the Quranic teacher was often the only "stranger," in Simmel's (1964: 402–405) sense of the term, to live regularly in smaller villages and settlements.

Analysis of the role of rural Quranic teachers is especially useful in eliciting the popular significance of memorizing the Quran. Some teachers remained for decades with particular communities (e.g., Waterbury 1972: 32); in other cases, Quranic teachers changed locales at frequent intervals. Many fqihs lived from little more than small fees in cash and kind, sometimes supplemented by the weaving of jallabas (Hart 1976: 183–184). Poverty did not preclude respect for Quranic teachers as carriers of the Quran.

Simmel’s concept of the “stranger” is useful in comprehending the Quranic teacher’s position in rural communities. As a “stranger,’’the fqih “has not belonged to [local society] from the beginning” and “he imports qualities into it, which do not and cannot stem from the group itself” (Simmel 1964: 402). The fqih is “objective” in that he is not “radically committed” to the community, but his objectivity, to continue to apply Simmel’s analysis, “does not simply involve passivity and detachment; it is a particular structure composed of distance and nearness, indifference and involvement.” As a stranger, the fqih has only more general and abstract qualities in common with members of the community in which he participates. “He is near and far at the same time” (Simmel 1964: 406–407), and is a concrete symbol of the link between the local community and the wider one of Islam.

Fqihs, also called “students” or “seekers after knowledge” (tulba), also serve as prayer-leaders for rural local communities at Friday prayers, write letters or contracts on demand (although after French reforms only authorized notaries could prepare legally binding contracts), provide Quranic recitations at weddings, funerals, and other life crises, and prepare protective amulets. Some fqihs additionally engage in magic (sihr) to influence the course of amorous affairs or the outcome of disputes (e.g., Berque 1955: 316–318, 329, 355), although such practices are considered beyond the pale of Islam (haram) by conscientious Muslims.

As professional outsiders with an intimate knowledge of the regions in which they taught and freedom to circulate in rural areas, fqihs constituted informal networks among themselves by which news of openings for Quranic teachers and other information was passed among colleagues. Significantly, in the years immediately prior to Moroccan independence, these networks were used to advantage by the nationalist movement, especially in southern Morocco. Within a decade after independence, the selling of textiles and certain other goods in rural markets and communities in some areas fell almost exclusively into the hands of former Quranic teachers, who took over this activity from departing Jewish traders. The Quranic teachers, like their predecessors, were already clustered into informal networks of trust and cooperation, and had a wide knowledge of the regions in which they worked. Aside from their Jewish predecessors, Quranic teachers constituted the only category of “outsider” ordinarily present in rural society. As “outsiders,” they had no direct stake in the local politics of land and water rights (Eickelman 1983).

*** Places of Study

In the larger towns throughout Morocco, students wishing to pursue their studies began by sitting with the circles of men of learning and their disciples that met regularly in the principal mosques (see Laroui 1977b: 196–197, 199–201; Brown 1976: 77). In rural areas, most advanced students continued for at least a few years at one of the numerous madrasas located throughout the country until the early decades of this century (Moulieras

1895; 1899; Michaux-Bellaire 1911: 436; Waterbury 1972: 30); only a few survive today. Often the level of learning at rural madrasas and zawyas compared favorably with the education obtainable in major urban centers (Berque 1958: 12; Eickelman 1976: 39, 60, 222, 249; as-Susi 1961; Doutte 1914: 269; Moulieras 1895: 76, 124, 187; 1899: 49, 583).

Such madrasas—and rural zawiyas in many regions—were an essential intermediate stage when Arabic was a student's second language. For many students content with the life of rural Quranic teachers, they could be a final educational stage. In some regions, such as Bzu, these madrasas were only clusters of tents; others were village mosques with adjoining lodgings for the shaykh and his students, who were supported, albeit frugally, by gifts of food from villagers and tribesmen.[18] Most students attended madrasas, often several in succession, as did 'Abd ar-Rahman. The three to five years characteristically spent in this all-male milieu, at least partially removed from their families and communities of origin, was an intense socializing experience. Students often developed close ties with their shaykhs, who could introduce them to scholars elsewhere in Morocco, and with fellow students. This was the case both in 'Abd ar-Rahman's stay in Ait 'Tab, mentioned in the last chapter, and his subsequent one in Dawwar Mshabbak.

In 1927 'Abd ar-Rahman was fifteen years old. His older brother, by then his de facto guardian and Qadi of Bzu, sent him to continue his studies at nearby Dawwar Mshabbak, as he had done earlier. The student body there was a fluctuating one, and students were not constrained to remain for any specific time. Many students simply drifted from encampment to encampment, much as was the pattern in medieval Europe, living a picaresque existence and remaining wherever there was sufficient largesse to maintain them (Aubin 1906: 78–79; Michaux-Bellaire 1911: 437; cf. Aries 1962: 190–191). To join an encampment, a student approached a mosque at which a fqih was conducting lessons and asked for permission to join them. Hospitality would almost always be offered overnight or for a few days. Longer stays depended upon the resources of the supporting community. Committed students such as 'Abd ar-Rahman sought out specific teachers by their reputation and remained with one teacher long enough to commit to memory and begin to understand some of the principal commentaries and key texts.

'Abd ar-Rahman began to speak Arabic at Dawwar Mshabbak. Its madrasa consisted of several tents, one of which served as a mosque. The students lived five to eight in a tent, with their total number fluctuating between fifteen and thirty. The age of students varied from six to forty, with about half coming from the immediate region and the remainder from Morocco's impoverished south. Some of the more advanced students were simply there waiting for an opportunity to become contracted Imshdrt) as teachers for rural local communities in the region. Others were preparing for higher studies at the Yusufiya.

As at the Ait 'Tab madrasa, student life at Dawwar Mshabbak was intensely communal. Lifelong friendships were forged there. The shaykh and students worked before dawn to perform their ablutions and prepare for the dawn prayer. They then ate together a thick

lentil soup (harira). From early morning until just before midday, students individually recited the texts on which they were working. Older students sat with the fqih, who recited and commented upon basic texts. Intermittently the fqih and some of the more advanced students left off their lesson circle to supervise the Quranic memorization of younger students. Lessons stopped just before the midday (duhr) prayer, after which students were free to do whatever they wanted until the sunset (maghrib) prayers. The evening meal, eaten about an hour and a half after sundown, was donated to the scholars on a rotational basis by households of the rural local community. Afterward, the older and more serious students studied by oil lamps or spoke quietly among themselves. Younger students were expected to do the washing and other chores for older ones in exchange for lessons.

‘Abd ar-Rahman’s participation in the scholarly community at Dawwar Mshabbak was cut short by a severe drought that affected the region in 1928. He says that conditions were so serious in Bzu’s hinterland that tribesmen were reduced to eating a poisonous plant in the region known in tashalhit as izatti.[19] In an earlier epoch, the madrasa might have been reconstituted once economic conditions improved, but with the changed circumstances of the colonial era and the demands for taxes from the colonial administration, the madrasa at Dawwar Mshabbak was unable to recover. ‘Abd ar-Rahman continued his studies in Bzu until 16 RabFa II 1347/2 October 1928. On that day, carefully recorded in his notebook, he set out for the first time to Marrakesh and studies at the Yusufiya.

** Four: The Yusufiya: A Profile of Higher Islamic Learning

For a Berber youth of sixteen setting out from Bzu in 192.8, even if he was the younger brother of the town’s qadi, the social universe remained very small. The improved roads and transport of the colonial era had done little to widen it. No Moroccan in Bzu yet owned an automobile, so most local travel was still by mule and horse; ‘Abd ar-Rahman set off for the Yusufiya on a mule. His baggage followed on another mule, with a household servant on foot. Once ‘Abd ar-Rahman reached the main road at Wad al-‘Abid, he waited for a bus to take him to Marrakesh. ‘Abd ar-Rahman had never before been to Marrakesh. Previously he had traveled in the company of his elder brother only to the nearby settlements of Damnat, Azilal, and Sraghna. It would be another decade before he was to travel as far as Casablanca, Rabat, Fez, and Meknes.

Marrakesh in 1928 was composed of the sharply contrasting madina and European ville nouvelle, a contrast which is today blurred despite the wall surrounding the old quarters, because the two “separate” towns have grown into one another. As early as 1914, French colonial authorities began to draw up plans to direct the future growth of

major Moroccan towns (Abu-Lughod 1980: 146). In Marrakesh as elsewhere, these plans called for the separation of the European “new town” from the “native” quarters. Except for the eventual provision of some piped water, sewers, and electricity, the madina was left “undisturbed.” The “new town” of Marrakesh, called Gueliz after a mountain located to its immediate north, was designed with wide avenues radiating from a central point. The main public and commercial buildings were located close to this center, with residential villas located along branching side streets. Gueliz grew modestly through the 1930s and at a more rapid pace only after the Second World War.

In 19x8, Marrakesh was still largely encircled almost entirely by palm groves. Today many of these have been cut down to make way for large tracts of popular housing. The wall surrounding its vast madina was built with the reddish clay of the region, which is why the city is affectionately referred to as the “Red City” {madinat al-hamra’). Then as now, Marrakesh is a staging point (and sometimes an end point) for the emigration of Berber-speaking tribesmen from the High Atlas mountains and the Sus river valley. Much of its population is bilingual in Arabic and Berber.

Gueliz was still roughly three kilometers from the walled city of Marrakesh in the late 1920s. At this time, Marrakesh was the largest city in Morocco. It was over one and one-half times the size of Fez and slightly larger than Casablanca. (Like Fez, Marrakesh was to be outstripped in size by the late 1930s by other cities more oriented to industrial and agricultural growth.) Although it was Morocco’s largest city, it attracted the fewest Europeans. Except for guided forays of tourists and a few small European enterprises such as carpentry shops, virtually no Europeans entered the madina, and those that did confined themselves to the wider passages. Most went no further than Jama‘a al-Fna’, the main square enlivened by musicians, jugglers, storytellers, beggars, and aspiring guides. Marrakesh lacked major industrial establishments, and European-style education for Muslims was available only on a reduced scale. A French-run School for the Sons of Notables opened in 1919. In contrast to Fez, where a fairly elaborate educational system was in place for the native elite by the 1920s, a secondary school {college musulman) was opened in Marrakesh only in 1936 (French Protectorate 1931: 58, Deverdun 1959: ix).

In the 19 20s, Morocco’s south still contained pockets of resistance to the French. Parts of the High Atlas mountains remained outside effective colonial control until 1933. Their final pacification, together with the earlier quelling of ‘Abd al-Krim’s Riffian rebellion in 1927, signalled to all Moroccans the futility of further direct confrontation with colonial authorities. Until ‘Abd al-Krim’s defeat, many elite of Fez kept their children away from French schools. After his defeat and exile, enrollments soared.

[[d-f-dale-f-eickelman-knowledge-and-power-in-morocc-5.png][Map 2. Map of Marrakesh, 1930. Based upon Prosper Ricard, Le Maroc (Les Guides Bleus), 4th ed. Paris: Librairie Hachette (1930), p.136.]]

Table 2. The Population of Marrakesh, Casablanca, and Fez, 1931

| | Marrakesh | | Casablanca | | Fez | |

| | Number | % | Number | % | Number | % |

| Muslims | 167,136 | 86 | 85,167 | 52 | 95,436 | 85 |

| Jews | 21,607 | 11 | 19,960 | 12 | 7,826 | 7 |

| Europeans | 6,379 | 3 | 57,981 | 36 | 9,201 | 8 |

| Total | 195,122 | IOO | 163,108 | 100 | 112,463 | 100 |

Source: 1931 census with corrections (Ricard 1936: 12.2; Adam 1968: 147). Census figures for the Muslim population were based upon administrative estimates.

Marrakesh was for centuries the center of the political and economic universe for southern Morocco. With colonial improvements in communications and the decision early in the protectorate to rule the southern region indirectly through tribal strongmen, its political leaders soon became frozen in place for the duration of French rule. The most powerful of the strongmen was Hajj Thaml al-Glawl (1879–1956), who emerged as France’s principal ally in the south after the death of his elder brother Madam in 1918. By the late 1920s he was well on his way to consolidating his political control over the entire region, influencing even minor administrative appointments. Although there were few French in Marrakesh, their influence was decidedly felt. It guaranteed the authority of Hajj Thami and his collaborators, over whom the French exercised minimal restraint.

Because of its traditionally high influx of rural immigrants, Marrakesh has sometimes been described as a city overwhelmed by its hinterland. This characterization is misleading. Several of the interior quarters of the madina are as distinguished and exclusive as their equivalents in other “Makhzan” cities such as Fez and Rabat. As in these cities, at least some of the elite have chosen to continue living in the madina. Not far from the Yusufiya mosque-university, for example, is Darb ‘AHlsh, a long, covered impasse in the interior of the madina. The street is also a cohesive neighborhood. There are no shops on the street to attract strangers. The nearest ones are on the “main” street, also inaccessible to vehicles,

perpendicular to Darb ‘Alilsh. As with most such quarters, the doors to individual houses give little clue as to the wealth of the inhabitants. The houses of scholars, wealthy merchants, and craftsmen are juxtaposed. Persons who enter the street and are unknown to residents are looked upon with suspicion, for the street is regarded as a spatial extension of its component households. Although not all residents of Darb ‘Alilsh have been there for generations, its population is stable and is composed primarily of persons born in Marrakesh itself.

Darb Mwasln is another such neighborhood, although it is composed of less prosperous households and is adjacent to the street of the dyers (Darb Sabbaghin). Many of its shopkeepers were born in the neighborhood and continue to live there. Through the 1930s, several distinguished but impecunious men of learning lived there who taught at the Yusufiya. Darb Mwasin is known architecturally for the mosque that carries its name, constructed between 1562 and 1573 by a Sa‘adi dynasty sultan, Sidi ‘Abd Allah bin Muhammad (r. ¹557–1574), and an adjacent fountain which has ceased functioning in recent years from lack of repair. It also contains the hostel (madrasa: the same term designates any place where lesson circles are held) for religious students in which ‘Abd ar-Rahman spent his seven years in Marrakesh. In contrast to the mosque, the madrasa has been dismissed by an architectural historian as “without character” and is difficult even to date (Deverdun 1959: 73). Closed in the early 1950s, it enjoys today a second life as a government orphanage for girls who claim descent from the Prophet Muhammad.

Older residents and shopkeepers of Darb Mwasin recall that the hostel was an integral part of the neighborhood, even if its students were always thought of as “outsiders” {afaqr, pl. dfaqiri). They were often called upon to recite the Quran at appropriate household occasions, and some people regularly brought food to needy students. Religious students of rural origin sometimes developed intimate community ties in Marrakesh. Virtually all the activities associated with the mosqueuniversity were intricately meshed with the wider social and cultural life of the community, a linkage that constituted both a major strength and an inherent limitation upon mosqueuniversity education.

*** Rural Students in Marrakesh

Rural students were readily distinguished from townsmen by their clothing and what townsmen judged as their awkward comportment. In the 1920s, most students of rural origin, including ‘Abd ar-Rahman, still shaved their heads and, as a sign of humility toward their shaykhs, did not wear turbans. This practice had virtually disappeared among younger townsmen, who in general adopted the fez as a sign of modernity. Despite their status as carriers of the Quran, most students were awkward and naive in the ways of the city because of their country origin. Townsmen were not averse to making jokes at their expense when they ventured beyond the immediate confines of the mosque-university and the hostels in which all but the most wealthy “outsider” students, usually of urban origin, were

lodged. Nonetheless, some rural students, especially those who came from families of learning, attained scholarly distinction by the most exigent urban standards.

Significantly, two of the most influential reformist shaykhs of the early twentieth century in Morocco, Bu Shu‘ayb ad-Dukkali (1878–1937) and Mukhtar as-Susi (1900–1963), were of rural origin, as were several of the other leading shaykhs of the Yusufiya. Ad-Dukkali was from a rural family that included several generations of men of learning. He first gained attention in Marrakesh at the age of thirteen by reciting all of Sidi Khalil’s Mukhtasar before Sultan Mulay Hasan I and showing a precocious command of classical Arabic. Later he gained further recognition through studies in Mecca and Cairo. In 1910, at the age of thirty-two, he was appointed qadi of Marrakesh and subsequently became minister of justice (Jirari 1976: 9–18). As-Susi was from a family of learning from the Sus region of Morocco’s south, where his father was a leader in the Darqawi religious order. He studied at a rural madrasa in the Sus and from 1919 to 1923 at the Yusufiya, where he was a student of ad-Dukkali and a contemporary of Bzu’s Qadi Ahmad. From 1923 to 1927 he was at the Qarawiyin, where he came into contact with most of the later leaders of the nationalist movement. In 1929 he returned to Marrakesh, where his lesson circles were highly popular among students. The French grew suspicious of his growing influence and in 1935 assigned him to forced residence in his natal village in the Sus (Touimi, Khatibi, and Kably 1974: 4041).

‘Abd ar-Rahman and other students from families of rural notables had economic and social advantages in securing ties with persons in the mosque-university milieu that were not available to poorer students. When ‘Abd ar-Rahman set out for Marrakesh, his elder brother gave him 600 ryals, an amount that ‘Abd ar-Rahman describes as “a lot of money” for the time. His brother also regularly sent him olive oil for cooking, flour, and additional funds as needed. Occasionally his father also sent him money, but not as much.

‘Abd ar-Rahman’s older brother maintained active ties with several of his former teachers. Upon his arrival in Marrakesh, one of the first things that ‘Abd ar-Rahman did was to convey his brother’s greetings to his former teachers. One was the reformist shaykh, Bu Shu‘ayb ad-Dukkali. Another, more traditionalist, was Muhammad ibn ‘Umar as-Sarghlm (d. 1938), who lectured daily from early morning until late afternoon. By the late 192.0s, Muhammad ibn ‘Umar was recognized as the leading shaykh of the Yusufiya. When he died, he was buried in the shrine of ‘Abd al-‘Azlz at-Tabba’, one of the patron marabouts of Marrakesh. ‘Abd ar-Rahman recalls that these shaykhs received him cordially, but because of his youth and inexperience, none paid any particular attention to him. In their guest rooms, however, he met other students and scholars whom he presumed by their presence to be serious and of good reputation. In this way he began to discern who was significant in the milieu of higher learning.

*** Student Hostels

Dormitories constituted a significant aspect of the experience of rural students, and for this reason are worth describing in detail. Madrasa students shared many common characteristics and activities. They were unmarried and usually relatively young, between the ages of sixteen and forty. Each hostel usually attracted students from particular regions, as was also the case in Fez (Marty 1924: 337–339).

By the late 1920s, most hostels were suffering from decades of neglect. In principle they were owned and maintained by revenues from pious endowments. Students paid no rents, although they often had to pay key money for rooms, the rights to which could be purchased. Rural students and others from outside Marrakesh also received a daily loaf of bread, the distribution of which was organized by the overseer of a separate pious endowment established for that specific purpose. The occupancy of rooms and the right to a bread allowance were obtained through the spokesman (mqaddam dyal at-tulba) of each hostel, a student informally selected by his peers for his ability to speak on their behalf when necessary and to see to the fair allocation of bread.

Because of the system of key rights, ‘Abd ar-Rahman had no difficulty in securing lodgings upon his arrival. His elder brother had purchased a key to a room at the Mwasin madrasa from one of his shaykhs a decade earlier.[20] After Ahmad left the Yusufiya in 1917, he allowed a succession of needy students from the Bzu region to use it until his younger brother required the room for himself. Such patronage was another of the multiple ways in which ties were made between persons in the community of learning. It is also responsible in part for the tendency of students from the same region to be clustered together.

Table 3. Principal Madrasas and Other Lodgings for Rural Students in Marrakesh, 1928–1934

Founded{1}	Rooms{2}	Students	Region of Origin
Yusufiya (madrasa)	1564/1565	60—70	150–200	Sraghna, Rahamna, Shawiya, Dukkala, Shiyadma
Mwasin (madrasa)	1500–1700	34–38	50	Dukkala, Sraghna, Shiyadma, ‘Abda, Sus, Sahara
Ibn Salih	c.1670	6	IO	Varied

| Bab Dukkala | c.1700? | 25–30 | 6–8 | Unknown |

| (vacant shops) Sidi bil ‘Abbas Sabti (shrine | 5 | ? | 30–40 | Varied |

| with sleeping rooms used by students) | | | | |

| Total | | 127—146 | 246–308 | |

{2} interviews with former students.

The Mwasin was considerably smaller than the nearby Yusufiya madrasa. Its thirty-eight rooms were equally divided between two stories. In the center of the ground floor was a fountain for ablutions. In contrast, the Yusufiya hostel is a vast, imposing structure, with a unified rectilineal design, a well-lit principal courtyard with a large, oblong basin fed by underground pipes iqadus) for ablutions, Andalusian woodwork, and stucco ornamentation.[21] The rooms were small in both madrasas, no more than 1.5 by 2. meters each, and furnished with little more than wooden coffers for the meager possessions of students and sleeping mats, which were placed on the floors or on elevated wooden platforms (katris). The wooden door of each room had a small opening through which the student’s bread ration could be tossed if the student was not present. For lighting, students had small oil lamps that could be placed in a niche in one of the walls. Each room also had a wooden beam in a corner on which clothes could be hung to protect them from mice.

Poor students slept two to three to a room. Wealthier ones such as ‘Abd ar-Rahman had rooms to themselves. After residing in the madrasa for several months, ‘Abd ar-Rahman acquired two additional rooms, using one for cooking and the storage of foodstuffs, another for sleeping, and retaining his original room for studying.

The life of wealthier students such as ‘Abd ar-Rahman was reasonably comfortable. He had regular remittances in cash and kind from Bzu, and cooperated with several other students in paying a man to came to the madrasa daily to do their cooking and washing.

‘Abd ar-Rahman and other well-off students regularly shared their food and other resources with poor (da’if) colleagues, who were by far the majority. These students sought in multiple ways to supplement their meager bread ration. Some received a small stipend from pious endowment revenues for reciting the Quran regularly in neighborhood

mosques. Others sought out occasions to recite it at weddings, circumcisions, and funerals, for which they received a meal and a modest fee. A few developed client relations with wealthy urban households that provided them regularly with food. Until the early twentieth century in Marrakesh, each religious student also received an annual gift of a jallaba from the sultan on the occasion of the Great Feast {‘Id al-Kabir), but this practice ceased with the advent of French rule.

There was sustained community support for higher Islamic learning. Humble artisans and even rural tribesmen periodically came to the Yusufiya to offer gifts of produce, clothes, and other goods to prominent scholars and donations on a smaller scale to needy students. Such actions brought good fortune (baraka) to the donor, for whom such donations were considered a pious act (ihsdri). Wealthy men of learning also contributed. In a 1936 letter, the religious students of Bzu origin in Marrakesh collectively wrote Qadi Ahmad, asking him to contribute money for the Feast of Students. Such requests were regularly made. By the 1940s, “Abd ar-Rahman began to receive similar requests (e.g., letter of 4 Jamada I 1365 / 6 April 1946).

More formal although by no means regular support was provided through pious endowment revenues. A pious endowment was established when a person irrevocably designated the income from a specified property for a pious purpose such as the construction of a mosque or madrasa, its maintenance, the provision of bread for students, a water fountain, the payment of stipends to religious students to recite the Quran regularly, or some equivalent purpose (see Le Tourneau 1949: 465; C. Geertz 1979: 151–154). No new major pious foundations appear to have been established since at least the mid-nineteenth century.[22] Moreover, the economic disruption that accompanied growing European intervention in Morocco had a negative effect upon pious foundation revenues. Nonetheless, successive rulers, local officials, and prominent townsmen saw sporadically to the maintenance and essential repair of mosques, madrasas, and the shrines of key marabouts. Donations for these repairs, like the construction of such buildings in more prosperous eras, was a pious act.

The collection and distribution of pious foundation revenues was supervised in theory by the chief qadi of Marrakesh, who also acted as overseer (nadir) of pious endowment revenues. Given the lack of control over this system, it was inevitable that revenues should be irregularly allocated and often be insufficient to cover the purposes for which they were designated. Often there was no formal accounting at all of income and expenses. Consequently, some madrasas and other buildings simply collapsed from neglect. Deverdun (1959: 567) mentions a madrasa in decrepit condition in the 1850s. No trace of it remained in ‘Abd ar-Rahman’s time. In practice, each pious foundation had its own administrator. After the protectorate was established in 1912, the French sought to centralize the administration of these revenues and to maintain an accurate inventory of them. According to ‘Abd ar-Rahman, the overseer appointed for Marrakesh in the 1920s, a relative of the pasha, had the obvious handicap of illiteracy. Because of ineffective administration, protectorate reforms were slow to come to the Marrakesh region. In Bzu, which was under the formal jurisdiction

of Marrakesh for pious endowments, the revenues of each pious endowment continued to be separately administered through the late 1930s.

A description of the role of hostel mqaddams indicates how pious foundations affected the lives of students in practice and and how students were governed. Spokesmen were selected informally by the students of each hostel for an ability to speak effectively on their behalf. In principle, the pasha of Marrakesh or those in charge of disbursing pious endowment funds could object to nominations, but rarely did. In Fez, there appears to have been a formal confirmation from the Makhzan of such spokesmen because they received a small monthly stipend (Le Tourneau 1949: 464). In Marrakesh confirmation was informal. Spokesmen were simply “known” (ma‘ruf). Thus Ahmad, ‘Abd ar-Rahman’s elder brother, was spokesman for the Mwasin madrasa during his stay in Marrakesh. He received neither a stipend, which in any case he did not require, nor a formal confirmation of his appointment.

To obtain the bread allowance, each new student paid a small fee to the spokesman, sixty francs as of 1928. The spokesman handed the funds over to the notary responsible for overseeing the distribution of bread to students. The spokesman could also recommend particular students when townsmen came to ask for tulba to recite the Quran for weddings, funerals, and other occasions. It was he who saw to the distribution within the hostel of gifts periodically offered by some wealthy merchants, and the allocation of rooms.

The informal criteria of eligibility to reside in a hostel suggests the unimportance of clearly defined formal authority in the mosque-university milieu. Deverdun (1959: 377) cites the opinion of a fourteenth-century Fassi jurist to the effect that students were obliged to attend lesson circles regularly and were subject to expulsion “by authority” in the case of misconduct or lack of “sufficient aptitude” for studies. One of the few critical cases of expulsion which occurred during ‘Abd ar-Rahman’s student days indicates how eligibility was withheld in Marrakesh. A Susi student in his late forties had lived for at least two decades at the Mwasin hostel. He was present when Ahmad Mansuri arrived in 1913, and was still there when ‘Abd ar-Rahman took up residence in 1928. ‘Abd ar-Rahman related:

In order to get money, he dabbled in magic. So did other students, especially those from the Sus. This meant that quite often he wrote charms for women. He also regularly brought girls and young boys to his rooms. Finally, the students formed a delegation to go to the pasha, Hajj Thami al-Glawi, to have him expelled. We were unsuccessful.

Eventually the collective pressure of the students led to his removal, but the incident underlines the lack of formal authority in student life. The moral authority of shared communal norms was not necessarily backed by formal sanctions. In the past, when the Makhzan provided more regular subsidies to teachers and students alike in the form of stipends— salted beef, grain, oil, and candles (Deverdun 1969: 467; Peretie 1912: 324–334), and rulers such as Muiay Hasan I took a direct interest in the scholarly community, collective

activity appears to have been more effective. Nonetheless, the designation of student, literally a “seeker of knowledge” {talib ‘Um), was applied to anyone who had memorized the Quran (or claimed to have done so) and who was oriented toward lifelong religious learning. Such a notion of scholar was highly diffuse, and was shared equally by the scholars of the mosque-university milieu and the wider community.

*** Higher Learning and Society

A sense of the scale of religious education in the 192.0s, however tentative, facilitates understanding how the cultural notion of knowledge was articulated in practice. Traditional higher education was considerably more restricted in scale than Quranic education. In 1931, the year of the first reliable census in the French zone of Morocco, there were approximately 1,200 students in Morocco’s two mosque-universities. The country’s total population (including estimates for the Spanish zone of influence) was 5,800,000 (Noin 1970: 1, 30, 32), so that mosque-university students constituted a miniscule 0.02 percent of the population. [23] Since most students left their studies after a few years to became merchants, village teachers, notaries, and the like, only a limited number could eventually claim to be men of learning.

The Yusufiya was smaller in scale than its Fez counterpart, and for most of its existence tended to attract students and scholars only from the hinterland of Marrakesh and Morocco’s south. Marrakesh first emerged as a major center of learning in the twelfth century, when it rivaled Seville and Cordoba in Muslim Spain. In following centuries its reputation as a center of learning rose and fell with the political vicissitudes of the city itself. Thus it thrived early in the nineteenth century, and again reached national prominence with the residence of the sultan there almost continuously from 1895 to 1901 (Burke 1976: 42, 59). In the late 1920s and early 1930s, the period of immediate concern to this study, the Yusufiya milieu contained roughly four hundred students. Six to eight shaykhs met daily with students in roughly ten lesson circles {halqas)^

The Yusufiya, like the Qarawiyin, constituted an institution in the basic sense of a field of activity whose members shared subjectively held ideas and conventions as to how given tasks should be accomplished. Although students and, to a more limited extent, their teachers were only transient members of the community of learning, most persons participated in the mosque-university milieu long enough to give it stability in terms of its participants and their relations with wider society.

The mosque-university’s use of space indicates its lack of sharp separation from the rest of society. The activities of the Yusufiya, like those of its counterpart in Fez, were concentrated in space that was shared with the wider community for purposes of worship and other gatherings. Lesson circles of teachers, students, and onlookers met regularly in the Yusufiya (Ibn Yusif) mosque, one of the largest and most central in Marrakesh, as well as in some of

the smaller mosques, religious lodges, and at least one shrine, that of the principal marabout of Marrakesh, ‘Abd al-‘Aziz at-Tabba‘. Only the hostels for rural students were reserved exclusively for students.

The Yusufiya had no sharply defined body of students or faculty, administration, entrance or course examinations, curriculum, or unified sources of funds. In fact, its former teachers related with amusement the frustrated efforts of French colonial officials to determine who its “responsible” leaders were and to treat it as a corporate entity analogous to a medieval European university.[24] Although teachers did not act as a formal collectivity, several older and respected shaykhs served as informal spokesmen for their colleagues on various occasions. Because of their recognition by the wider community, such individuals in fact controlled the distribution of gifts given by wealthy or powerful individuals to the community of learning. The ability of certain men of learning to control such distributions and to exercise influence on other occasions did much to consolidate their reputations.

The activities of higher learning were integrally related to and limited by the values and expectations of wider society in numerous ways. Teachers were not formally appointed, although some held royal decrees (dahirs) providing them with recognition and specified emoluments. Younger shaykhs simply began to teach after they were assured of the implicit consent of established men of learning capable of sponsoring them and defending them when necessary from the criticism of students and outsiders. The lack of formal appointment meant that shaykhs of lesser reputation had to be especially scrupulous about comporting themselves and commenting on texts in expected ways. Recognition brought most, but not all, teachers small stipends from pious endowments designated for their support, in addition to occasional gifts of grain, olive oil, and clothing from pious townsmen, tribesmen, the sultan, and his entourage.

The publicly accessible activities of the mosque-university did not provide the full range of knowledge, including poetry, history, and literature, or training in the rhetorical style considered essential for men of learning. The formal speech of men of learning was replete with allusions to classical texts and used stylistic conventions that were far removed from ordinary speech. These conventions included the deliberate rhyming of words and phrases and the use of a classicized diction that avoided the intrusion of colloquial or “common” (‘ammi) syntax or phrases. Another quality prized by men of learning was the ability to compose verses for particular occasions. These circulated constantly in oral and written form. Most such poetry drew upon stock formulas, but these still had to be learned and were expected of educated men.[25]

As in any educational system with diffuse, implicit criteria for success and in which essential skills were not fully embodied in formal learning, the existing elite was favored. Moreover, the attribute of “student” did not in itself form much of a basis for meaningful collective action, at least by the late 1920s. Students became “known” as such through their comportment and acceptance by persons in the community of learning, not through any

formal procedures. Each student was on his own to discern those persons and ideas that were significant in the world of learning and to create a constellation of effective personal ties with which to function. Students from Marrakesh itself, especially those from wealthy or powerful families, had substantial initial advantages in securing useful ties. They continued to be enmeshed in their families' networks of kinship, friendship, and patronage. Since all students from Marrakesh continued to live at home, those from wealthier and more prestigious families were in a position to invite shaykhs to their homes and to arrange for formal or informal tutoring. Such students often attended the public lesson circles of the mosques and shrines only irregularly.

A significant exception to the diffuse nature of student identity in both Fez and Marrakesh, was the annual "Carnival" or "Feast of Students," introduced in Chapter One. It was an annual occasion on which the sultan and his entourage publicly acknowledged students as a collectivity. Each spring, students solicited contributions from townsmen, and a student was proclaimed "sultan" for the duration of a three-week outing (nuzha). The real sultan's parasol, a symbol of authority, was often loaned to the student sultan for the duration. The student sultan appointed his peers to offices in his entourage, mirroring the real Makhzan. The first week of festivities included a major Friday procession. The next day, the real sultan's ministers visited their student counterparts with gifts. Sunday was the turn of the real sultan, before whom a burlesque Friday sermon (khutba) was delivered. Doutte (1905: 200) demurely refrains from citing obscene versions in circulation, but provides others. I translate a brief extract, lacking the rhyme of the original, from one of his examples:

Praise be to God, Creator of incisors and molars

And who has prepared them to bite into apples and pears And who has created the hand and the mouth

And who has prepared them to make mouthfuls disappear. O my brothers, he who eats butter and honey acts well and proceeds in the good way

And follows the straight path and the just one.

He who eats beans and mallow strays and does wrong And he harms only his stomach and wrongs no one else. Worshippers of God, For he who makes me eat white bread and chicken, God will open wide the door of Paradise

And he who gives me barley bread and camel meat Shall share in hell, the worst of soujourns

—Doutte 1905: 214–215.

At the end of the sermon, the real sultan gives his student counterpart cash and gifts so that the students can prolong their festivities. Doutte also describes in detail the public processions and provides an inventory of the gifts presented by the real sultan to the students as a collectivity on one occasion: thirty-eight sheep, twenty jars of butter, and four sacks of seminola, in addition to gifts from other officials.[26]

On no other public occasion in Morocco was satire directed against the protocol of the Makhzan and its authority, which may be one reason why the French brought about its demise. One aspect of the occasion particularly concerned the French. At the very end of his tenure, the student sultan had the right to throw himself at the feet of the real sultan and present him with a list of favors to be granted. One reason that wealthy merchants often subsidized the bidding of their candidates for the role was that the favors granted could be quite substantial. According to Cenival (1915: 139), the cost of purchasing the right to becoming student sultan escalated in Fez from 750 francs in 1916 to 4,000 in 1917, 2.2,500 in 1923, and 13,250 in 1924. The unusually high figure for 1923 was caused by a qaid who wanted the student sultan to ask that a member of his family be appointed as his deputy; the request was refused. In 1925 the protectorate administration forbade seeking favors of the real sultan during the carnival. As a result, the auction price for the privilege of becoming mock sultan in Fez immediately fell to 1,350 francs. Comparable figures for Marrakesh are unavailable.

Although the French sought to discourage the Feast of Students, it continued to thrive in Marrakesh throughout ‘Abd ar-Rahman’s stay. For most of his years there, the Sultan of the Students was from Dukkala. Religious students from that region were given bridewealth and a home if they returned as Sultan of the Students, so competition was intense. Some students prolonged their stay in Marrakesh in order to be selected. Although the pasha did not attend the event personally, presumably at the instigation of the French, his deputy was present and provided funds, soldiers, and the loan of a horse.

‘Abd ar-Rahman usually returned to Bzu during the time of the Feast of the Students, but he remained in 1928 because a friend of his, Si ‘Umar ad-Dukkali, became mock sultan. After his week as sultan in Marrakesh, Si ‘Umar returned to Dukkala. ‘Abd ar-Rahman accompanied him. Once they arrived at the house of the qaid of the region, they were entertained lavishly and then provided with a car and a tribal guard of honor for the remainder of the journey.

*** The Mosque-University Milieu

Students acquired the necessary knowledge and personal contacts to achieve reputations as men of learning through three overlapping spheres of activity: lesson circles; peer learning, including participation in student literary circles; and sponsorship by established men of learning. The first and third spheres are familiar elements in accounts of Islamic education. Peer learning is not, since traditional Arabic sources have stylistic conventions that render them almost entirely silent on informal patterns of learning. Thus, when several Moroccan men of learning were asked to prepare short written autobiographies (tarjamas), they mentioned only learning derived from their shaykhs, in conformity with explicit cultural assumptions concerning the proper acquisition and transmission of learning.

**** Lesson Circles

The spatial and temporal setting of formal learning is highly significant in suggesting the relation of religious knowledge to society at large. Almost all of the lesson circles that met in the daytime were held in the Yusufiya mosque itself and concerned the most traditional and accepted texts of jurisprudence, grammar, and rhetoric. They were conducted by shaykhs regarded as the most senior and conventional. Evening lesson circles were usually held only in shrines, religious lodges, and smaller mosques. These were conventionally devoted to less established subjects and texts, and were generally conducted by reformist shaykhs and those of reformist sympathies, although a few were also conducted by shaykhs who lectured in the daytime at the Yusufiya.

Daytime lesson circles met five times weekly, Saturdays through Wednesdays. The shaykhs who conducted these lesson circles usually also conducted lesson circles on Thursday and Friday mornings, but would comment on different texts. During the major religious holidays, commentary on the regular texts were also suspended. The holidays were ‘Ashura, the tenth day after the start of the Muslim New Year; the Prophet’s birthday {‘Id Mtlud); Ramadan, the lunar month of fasting; and the period of the Great Feast, from 25 Dhu Qa‘ada in the lunar calendar to 25 Dhu Hijja. The texts commented upon during these periods included panegyrics on the Prophet, biographical literature on him, and commentaries on the sayings and actions of the prophet {hadith). Rural students took advantage of the longer holidays to return to their regions of origin, so that at these times the audiences of shaykhs was less rurally oriented than they were for the rest of the year.

As in the rest of Marrakesh, mosque-university activities were organized around the daily cycle of prayers. ‘Abd ar-Rahman’s schedule appears to have been fairly representative of that of serious rural students. He woke up just before dawn to perform his ablutions and prayers. Then he read and memorized in his room until eight in the morning, when the first lesson circles began at the Yusufiya. Each was attended by ten to thirty regular students, depending upon the popularity of the shaykh. The first lesson circles of the day concerned jurisprudence. Throughout his six years at the Yusufiya, ‘Abd ar-Rahman followed the lessons of Shaykh Muhammad ibn ‘Umar as-Sarghini on Ibn Ishaq’s Mukhtasar. Indicative of the lack of “closure” in traditional studies, Ibn ‘Umar was unable to complete

his commentary on the entire treatise in the six years that ‘Abd ar-Rahman followed his lessons.

A second group of lesson circles began mid-morning. These were primarily concerned with grammar, and ‘Abd ar-Rahman followed the commentaries of Shaykh Ahmad Agurram, a Berber of rural origin, who commented on Ibn Malik’s Alfiya. The midday prayers marked the beginning of the next cycle of lesson circles, when ‘Abd ar-Rahman returned to Shaykh Muhammad ibn ‘Umar for his commentary on texts dealing with grammar, rhetoric, and the conjugation of verbs—sciences that were important, ‘Abd ar-Rahman explained, in order to establish the precise meaning of utterances. Following the mid-afternoon (‘asr) prayers, ‘Abd ar-Rahman joined Shaykh Mulay Ahmad al-‘Alami for his commentaries upon Ibn ‘Asim’s Tuhfa and, in later years, his Quranic exegesis, a subject that was then being reemphasized in the lesson circles of the Yusufiya under the stimulus of reformist shaykhs.

There was more flexibility in the content and conduct of the lesson circles that met after the sunset prayers. After sunset, Shaykh Muhammad ibn ‘Umar went to a small mosque in a fort (qasr) situated next to the royal palace, where he lectured on Ibn Abi Zayd’s Risala, a twelfth-century legal text characterized by Berque (1949: 75) as a “juridical vegetation of practical applications, cases in point, and legal justifications.” The reformist shaykh, Mukhtar as-Susi, regularly lectured evenings at the shrine of ‘Abd al-‘Aziz at-Tabba‘ and in the Darqawi religious lodge, which also served as his residence. He even commented upon texts of poetry, including the Maqamat of al-Harirl and occasionally lectured in colloquial Arabic, so that his lectures could be widely understood.

The conduct of lesson circles in public settings, where they were accessible to nonstudents at all times, indicated popular support of and respect for the activities of learning, but also imposed implicit constraints upon what was learned and the conduct of the lessons. Leading shaykhs were publicly treated with deference and respect as they walked through the streets; their hands were kissed, and it was not unusual for gifts to be offered them by pious townsmen and villagers. As another indication of respect, many merchants and craftsmen regularly attended lesson circles for the religious merit they felt such participation would bring, despite the fact that few of them could follow the classical Arabic in which they were presented. Nonetheless, their presence restricted the introduction of unfamiliar material in lesson circles, informal discussions between teachers and students, and anything that deviated from popular expectations of what was “proper” for such activities.

Propriety of form obliged shaykhs to adhere to the rhetoric of classical Arabic and to comment only upon the texts of others. The formal necessity to do so, no matter how urgent some considered the political issues of the day to be (Berque 1974: 174–175), constrained both reformist and other shaykhs to stress that they spoke less for themselves than in their roles as transmitters of a fixed body of knowledge. As Bloch (1975: 16) has observed, at a high level of rhetorical formality, the content of speech and the order in which material is

arranged are not seen “as the result of the acts of anybody in particular, but of a state which has always existed.” Such form is, of course, congruent with the paradigm of mnemonic (and popularly legitimate) learning. The same level of formality is apparent in the preparation of tarjamas. The impersonal nature of the tarjama’s literary form, in which the third person is used both for biographies and autobiographies, reinforces the formal ideological conviction that religious knowledge is transmitted intact from generation to generation without alteration by persons or events. But although the words could be the same, meaning could shift, and the use of some texts and the neglect of others could be used to make a statement on contemporary events. Only those with a sophisticated command of such textual nuances could follow the meaning of the lecturer first-hand.

In practice, shaykhs could introduce a wide variety of material into their commentaries, but the base of the educational process was still a set of texts that took years to memorize and even more time to use actively in discourse. In itself, the form of commentaries did not limit innovation in subject matter and adaptation to change, except that it deflected attention from awareness of historical and contextual transformations.

The form of lesson circles conveyed the notion of the fixity of knowledge by minimizing active student contributions and by providing no checks upon what students understood. Only the student chosen as reader (sarid) of the text to be commented upon took an active role. As this task was rarely rotated, few students acquired even this experience. The shaykh interrupted the student’s reading only to correct errors of vocalization and to deliver his commentary. As with Greek and Latin literature in medieval Europe, the transmission of a text entailed taking it by dictation from someone reputed to know its proper form, so as to prevent the accretion of errors (Reynolds and Wilson 1974). More significantly, however, only the oral transmission of knowledge was regarded as culturally legitimate in the Moroccan context; knowledge acquired exclusively from the study of books, as in classical Greece (Ong 1981) was considered unreliable. Interruption of student readings was a way of signaling important points, and verbal emphases could be used to communicate more than a written text could convey. Significantly, the introduction of printed texts after 1865 (al-Manuni 1974: 207–213) had minimal impact upon the form of the lesson circles. No questions were asked during these sessions, and students rarely took notes or made annotations in the printed copies of texts that a few possessed. Former students explained that deference and propriety toward their shaykhs prevented their openly raising any issues. Questions had to be placed indirectly, usually in private as the shaykh prepared to leave the mosque or shrine, so as not to suggest a public challenge to his scholarship (see also Delphin 1889: 28). Moreover, as former students emphasized, informal contact with their shaykhs to discuss specifically textual matters was exceptional. Thus there were no significant practical opportunities for students to use the concepts or materials they sought to learn under the guidance of their shaykhs.

A parenthetical comment is essential here. There is no reason to assume, as many scholars have, that latter-day Islamic higher education in Morocco was a “decayed” remnant of earlier periods. Intra-Islamic differences noted by Ibn Khaldun have already been mentioned. In Morocco at least, the educational process was never fully encompassed within the public

activities of lesson circles. In other countries lesson circles sometimes were arenas for long-term dialogues between teachers and their students (e.g., Snouck Hurgronje 1931: 190; Fischer 1980a: 61–103; Makdisi 1981); this pattern is only one of several that Islamic education has taken, although it has often incorrectly been assumed to be normative for the entire Islamic world. Thus there were several patterns of Islamic education, of which the Moroccan emphasis upon mnemonic possession is but one realized form. Indeed, when some reformers decided in Fez that French should be added to the curriculum of religious students —it was never added at the Yusufiya—study of this foreign language took the characteristic form of memorized verses, in Arabic script:

sabah al-khayri ‘indahum “Bonjour” wa-in ’ardta tul ad-dawami qul “Toujours” as-su’al ‘an al-hal ‘indahum “Comment §a va?” wa-l-jawdbu ‘ind al-ghaya “Qi va.”[27]

“Good morning” among them is Bonjour, To express forever say: Toujours,

Asking “How’s it going?” among them is Comment ga va? And the reply to that is T’a va.

Reformist shaykhs sought to introduce new material into lesson circles and to draw students into a critical questioning of the relation of Islam to contemporary society (Merad 1971). A description and analysis of the context of their lesson circles and the extent to which they were innovative indicate the constraints that the public and religious conception of valued knowledge placed upon the potential for adaptation. Former students of the period, including ‘Abd ar-Rahman, spoke enthusiastically of the reformist shaykhs as having “liberated” (harrar) them from what they regarded as commentaries upon a narrow range of subjects that had remained unchanged for three or four hundred years. Such hyperbolic claims accurately reflect the attitude of students, but reformist teachings fit well within the “prismatic” nature of Islamic learning. A comparison of lists of texts commented upon at different periods from the late nineteenth to the early twentieth century indicated regular variations in both subjects and texts (Delphin 1889: 30–41; Michaux-Bellaire 1911: 434–449; Peretie 1912: 334345; Marty 1924: 345–347; Berque 1949).

In practice, the principal achievement of the reformers of the 1920s was to introduce material into lesson circles that men of learning earlier had privately acquired in the houses of the elite: Quranic exegesis, theology, history, and classical poetry and literature (adab). The reformers argued that these topics were as much a part of the religious sciences as those subjects that had been taught conventionally in Morocco prior to their time (as-Susi 1961: ix, 167–168), a contention that engendered animosity from more traditionalist shaykhs. As Mukhtar as-Susi gained in popularity at the Yusufiya during the late 1920s, men of learning opposed to him went to the pasha and attributed to him the claim

that he saw himself as another mahdi like Ibn Tumart (d. 1130), the Berber religious reformer and founder of the Almohad [al-Muwahidun} movement, who modeled his life on that of the Prophet Muhammad and who saw himself as the Prophet's spiritual heir. As-Susi's detractors also claimed, with some contradiction, that he had students read poetry about women and drinking, not about religion. His more modernist detractors told students inclined to support him that they were not modernists {'asriyuri) but left-handed {'isriyuri), those who were not following the right path of Islam. The allusion to left-turning referred to lefthanded locks, those that did not conform to accepted patterns, and not to the political left of European politics. Such borrowed allusions became prevalent only later.

Despite reformist innovations and efforts to instil a new critical approach to the religious sciences that went beyond the assimilation of received texts and tradition, knowledge continued to be legitimized by indicating how it fitted within the established religious sciences. It also had to be conveyed in classical Arabic, which limited its accessibility to the same select few who participated in traditional Islamic education. Reformists made some use of colloquial Arabic, an immensely popular innovation, but mostly on the occasion of religious holidays.

The political authorities were aware how easily lessons in colloquial Arabic could become a formidable political vehicle. Nonetheless, even reformist shaykhs, to seek legitimacy for their teachings, lectured within the range of popularly expected places and times. The fact that they lectured only after the sunset prayers, a time set aside for the more peripheral religious sciences or for less established shaykhs, and in locales such as religious lodges and smaller mosques, signaled to all but their immediate followers that their teachings were not symbolically as central as the "core" components of the religious sciences taught during the day at the Yusufiya. Within the restricted group of mosque-university students, reformist shaykhs enjoyed a considerable following, despite the active opposition of many of the more traditional shaykhs, who were frequently backed by support of the public and the political authorities. In the context of the lesson circles, the reformists did little to make their teachings accessible to a wider audience or fundamentally to change prevalent understandings of the forms in which valued knowledge was conveyed.

**** Peer Learning

Peer learning has been neglected in the study of many educational systems, including Western ones, because it is characteristically informal.[28] In Morocco it provided what public lesson circles could not—an active engagement with and practice in the comprehension of basic texts. For most rural students, peer learning had special importance, since such students were usually even more cut off than their urban counterparts from initiating informal contacts with their shaykhs, especially during the earlier years of their studies. Even in urban milieus, reading and writing were often learned from peers and not from formal education.

‘Abd ar-Rahman’s experience in Marrakesh indicates the significance of peer learning. For the first three months after his arrival in Marrakesh, he lived alone at the Mwasin and gradually got to know which of his fellow students were intent upon their studies. In the room above him, for example, was a Susi, ST Muhammad Tanani, who later got a job working for the Ministry of Justice; he read in his room until as late as one in the morning. “I could tell because there was a light on his room for all that time.” During his early months in Marrakesh, ‘Abd ar-Rahman continued to visit the shaykhs with whom his brother studied, including Bu Shu‘ayb ad-Dukkali. One of the fellow students he met during one visit to Bu Shu‘ayb was Si Muhammad bin Talib ad-Dukkali, an older, impecunious student who was also living at the Mwasin. Because Si Muhammad was also from Dukkala and was a coguest with Shaykh Bu Shu’ayb, ‘Abd ar-Rahman assumed that the two scholars from Dukkala were “close” (qrib), another indication of Si Muhammad’s integrity. ‘Abd ar-Rahman explained how Si Muhammad came to share his rooms:

Si Muhammad (d. 1946) was a great man of learning who never spoke unless it was necessary. The Quran was always on his lips. He lived from the daily bread given rural students and from the daily eight francs he received for reciting [the Quran] at a mosque. I observed his conduct for some time. Finally, I spoke to him and said that I was a beginner [in the religious sciences] and wanted someone to live with me who could help me in my studies. So I gave him the key to one of my rooms and said it was his. I wanted nothing in return except the opportunity to speak with him about the books I was reading. Si Muhammad was in his thirties and I was sixteen or seventeen when we began to live together. Whenever he needed a little money, I gave it to him.

What I had been doing until I met him was memorizing books, but without understanding what I read. We worked alone for the first several months that we lived together. Then, although I was a newcomer to Marrakesh, students who had been there for years asked me to read with them. They saw that I was a serious student and wanted to study with me.

For seven years I lived with Si Muhammad.... This was the real learning that I did in my years at the Yusufiya. Of course I learned much at the lesson circles, but it was in reading texts {al-mutun) with Si Muhammad and with other students and in explaining them to each other that most of the real learning went on.

After he left the Yusufiya in the mid-193os, Si Muhammad became a minor official with the Ministry of Justice and married a daughter of the qadi of Dukkala, his region of origin. Some men of learning in Marrakesh are less admiring of Si Muhammad’s scholarly credentials; one described him to me as an ordinary, plodding rural fqih. Such an evaluation in no way vitiates the fact that he provided ‘Abd ar-Rahman with what the public lesson circles could not: an active engagement with and comprehension of the basic texts.

Knowledge of basic texts, however, was sufficient qualification only for modest positions as notaries or village teachers, though it was the terminal stage of learning for all but a few students. The additional knowledge considered essential for men of learning and the practice necessary to develop competent rhetorical style took place in a complementary form of peer learning—the small, ephemeral literary circles to which a large number of the more successful students belonged.[29] These literary circles flourished especially with the rise of the proto-nationalist movement in the late 192.0s, but similar groups existed in earlier periods and were by no means unique to Morocco (Delphin 1889: 27, 53; Heyworth-Dunne 1968: 13, 40, 66). Participants in these circles read and discussed the Moroccan literary magazines (e.g., Majallat al-Maghrib and Majallat as-Saldm) that had begun to emerge during this period, Moroccan newspapers and those of the Arab East (banned by the French), books on subjects such as history (including that of Morocco), geography, poetry, and their own compositions.

As was the case with other aspects of higher Islamic education, student literary circles were weak in organizational form and dissolved frequently. Most were relatively small, with a dozen or so members, and usually met daily, after the sunset prayers. ‘Abd ar-Rahman belonged to the “League of Goodness and Fortune” (jam‘iyat al-khayr wa-s-sadad), which lasted for about six months in 1932, until it was forced to dissolve by agents of the pasha. Although it was referred to in formal Arabic as a “league” or “association” (jami’a), ‘Abd ar-Rahman informally referred to the group as a ta’ifa, using a word associated with religious lodges, which the League resembled in form. The League’s informal leader was Ibrahim al-Ilghi, a younger brother of the reformist shaykh Mukhtar as-Susi, who rented a small house adjacent to his brother’s Darqawi religious lodge for the use of the group. A small fine was levied on members whenever they missed a meeting, the proceeds of which paid for a meal that its members shared each Friday after the communal prayers, a practice also common to the religious brotherhoods of the period.

The League of Goodness and Fortune, like other peer associations, provided a training ground for debating, speaking, and writing within the conventions of formal Arabic. Relations among its members approached equality, so that participants took turns in delivering speeches which were subjected to the criticism of the group.

To indicate the tenor of these speeches, ‘Abd ar-Rahman showed me a notebook containing a speech that he presented to the League. The aim of the speech was to defend Marrakesh against the charge that it was not a major cultural center because so many of its inhabitants were Berber-speakers and because it had a smaller community of learned men than Fez. In alliterative, rhymed prose, ‘Abd ar-Rahman defended Marrakesh by describing its physical beauty and its great poets and men of letters, both past and contemporary. The speech further enumerates the major marabouts (salihiln) associated with Marrakesh, confirming the lack of a sharp dichotomy in the early 1930s between a reform-minded Islam and a more popular form in which local maraboutic beliefs were considered to be an integral

part of Islam (see Eickelman 1976: 2.11230). The speech concludes by exuberantly labeling Marrakesh the “Baghdad of the Maghrib.” Most of the speech consists of conventional platitudes, but its content, diction, and syntax reflect a style mastered only by the traditionally educated.[30]

Some literary circles, especially those influenced by reformist ideas such as the League of Goodness and Fortune, were concerned to a limited extent with undertaking political action for the benefit of the wider Islamic community. Carriers of religious knowledge regarded themselves as legitimate spokesmen for Islam, and were popularly regarded as such. This was especially the case after the “Berber Proclamation” of 1930, by which the French formally extracted certain Berber-speaking regions of Morocco from the jurisdiction of Islamic law courts. This event had repercussions throughout the Islamic world as a symbol of the efforts of European colonial powers to weaken Islam. The practical influence of men of learning, sharply circumscribed since the advent of colonial rule, temporarily reemerged with this event. In some Moroccan cities, including Fez, protests organized against this proclamation were overtly political and occasionally violent (see Brown 1973: 201–215; 1976: 198–206). In general, however, protests took traditional and nonviolent forms such as public communal prayers similar to those in cases of drought or other natural disasters. Many of these prayers were organized by literary circles. In Marrakesh, firmly under the control of its pasha, Hajj Thami al-Glawi, demonstrations were rapidly quelled. Students with ties to urban and rural notables were warned in advance by their relatives to stay removed from the “troubles.” Said ‘Abd ar-Rahman:

A few days before the Berber proclamation, a messenger came to me from [my elder brother in] Bzu. He said that something big was going to happen in a few days and to stay away from it by remaining in the hostel. I didn’t know what it was. I thought that perhaps it had to do with a film the Jews were making.[31]

I remained in my rooms, but many of the other students went into the streets to demonstrate. Soldiers {makhaznis} from the pasha arrested many of them and took them to prison. Later, much later, some of the men of learning went to the pasha to plead for the students’ release, and most of them were. I wanted to continue my studies and these demonstrations had nothing to do with my studies.

Participants in several literary circles nonetheless took action that could at least formally be construed as nonpolitical. One such action taken by the League of Goodness and Fortune was for its members to persuade individually (to avoid suspicions of organized group activity) the men who gathered each evening in the town’s mosques to recite the Quran in unison instead of separately, as had been the practice, in order to symbolize the unity of Islam. In this activity they were successful, but the pasha’s police soon discovered who instigated it. Some leading religious scholars vouched for the intentions of the League’s members, so they avoided arrest. Still, they were compelled to give up their meeting place and refrain from meeting in the future.

The narrow range of political actions undertaken by participants in lesson circles and even student associations suggests the restricted vision of public responsibility associated with the Islamic tradition of “gentlemanly” education as elaborated in Morocco. A man of learning’s primary responsibility was to acquire religious knowledge and to use it in prescribed ways, not to seek to alter the shape of society. Reformist Muslim intellectuals in North Africa, stimulated at least in part by the fact of European political dominance, challenged many aspects of Islam as it was locally understood, both popularly and in educated circles, but they fell short of offering ideological and practical alternatives to the existing social order. Reformist teachings in the 1930s offered no alternative to the accepted popular notion of social inequality as a “natural” fact of the social order, nor did they elaborate a wider notion of social responsibility to men of learning than that of perfecting their own understanding of religious knowledge and communicating it to relatively restricted circles (Merad 1971: 193–227; Eickelman 1976: 126–130).

**** Sponsorship

Students remained in the milieu of learning for as long as they chose or were able to. Just as there were no formal markers of entry to this milieu, there were none upon leaving it. Only a few students managed to acquire reputations as men of learning. There were no explicit criteria by which recognition could be achieved, so education could not assume the function of “certification” so closely associated with modern Western institutions.

One means, however, of signaling the completion of studies was for a student to ask each of his shaykhs for a “teaching license” (ijaza). Such documents specified the texts or subjects studied and the qualifications of the teacher. In Morocco and throughout the Islamic world, teaching licenses were only as good as the reputations of their writers and the facility with which their bearers could use them (cf. Heyworth-Dunne 1968: 67–69; Makdisi 1981). As ‘Abd ar-Rahman commented, one sought ijazas from those shaykhs who “had God’s blessings in the religious sciences and feared God the most, those who were older and more powerful and who always had their hands kissed in the street.” In practice, many outstanding students of the period, especially those from Marrakesh itself, claim that they deliberately did not ask for such documents; many were prepared as mere courtesies for educated rural notables, and not to possess them could in some circumstances be a mark of higher status. What counted was sponsorship and active recognition by established men of learning and the effective use to which an individual could put such ties as well as those with other persons of influence.

Since the world of learning was not a closed community, support in nonlearned environments could also be decisive in acquiring a reputation for learning. As indicated in the following chapter, Moroccan men of learning of the generation of the 1930s have significant ties with each other, created in part through common schooling; but these ties are not exclusive, and overlap with social bonds created on other bases. Social recognition

as a man of learning is an attribute that is used variously according to social context. In Morocco such persons constitute a social type rather than a distinct group that has sharply defined boundaries or that acts collectively now or did so in the past (Brown 1976: 75–81; Burke 1976: 218; cf. Eickelman 1976: 89–91, 183–189).[32]

The majority of students rarely used religious knowledge in more than an iconic fashion, as a marker of one-time participation in the milieu of learning. When I asked former students about the fact that most left their studies prior to acquiring scholarly recognition, there was often a formal expression of regret but none of failure attached to such attrition. In discussing their years at the mosque-university, most emphasized the opportunities they created to secure ties with persons within and outside the community of learning. These ties often were of use later in facilitating commercial, political, and entrepreneurial activities. The frequency with which such ties were mentioned suggests an implicitly shared conception of career, although not in the narrowly occupational sense of the term. When I asked former students what their goals were at the time of their studies, most replied that they were concerned primarily with the acquisition of the religious sciences. This was to be expected, given the cultural emphasis upon such valued knowledge. Acquiring the religious sciences additionally implied participation in social networks with persons drawn from different backgrounds and regions of Morocco, and thus with actual or potential access to a wide range of centers of power. No other preparation, except perhaps association with the Sultan’s entourage, enabled a person to acquire such a wide range of potential associations. Knowledge of the religious sciences was, of course, essential at some level in order to function as a qadi, a notary, a scribe with the government, or a teacher in the religious sciences. Acquiring such knowledge also provided the consociational base from which a wide range of extralocal political, economic, and social activities could be undertaken, at least so long as there were no major alternatives to Islamic higher education.

** Five: The World of the Educated Rural Notable

“I received,” says Husserl, “the education of a German, not that of a Chinaman. But my education was also that of the inhabitant of a small town, with a home background, attending a school for children of the lower middle class, not that of a country landowner’s son educated at military college.”

—cited in Bourdieu 1967: 358

In the beginning of 1354 (April 1935), [‘Abd ar-Rahman] unwillingly returned to Bzu because his brother Ahmad (may God comfort him) appointed him as notary and deputy (nd’ib} without prior consultation. He intended to continue steadfastly in his studies but his hopes in this were extinguished. Circumstances did not otherwise permit.”

—Tarjama, November 20, 1976

*** The Return

One morning in April 1935, the car and driver of the qaid of Azilal, Qadi Ahmad Mansuri's father-in-law, arrived unexpectedly in Marrakesh. The driver had orders to take 'Abd ar-Rahman immediately to Azilal. Through friends traveling from Bzu to Marrakesh, 'Abd ar-Rahman knew that a notary in Bzu had recently died and that there was no other qualified notary of Bzu origin to take his place. He was also aware that his elder brother intended to appoint him to keep the post from going to an "outsider" (barrant).

'Abd ar-Rahman arrived at the Native Affairs Administration (Controle) building in Azilal later that day and was immediately ushered into the office of the French officer; his brother was also there. The officer took one look at 'Abd ar-Rahman and said that he was too young for the post. He was only twenty-two at the time. After further discussion, the captain finally allowed 'Abd ar-Rahman to proceed to Rabat to be examined by the minister of justice on his knowledge of Islamic law and to leave the final decision to Rabat officialdom. A mere notary could be examined and confirmed in Marrakesh, but appointment to the post of deputy qadi, even if unpaid except in the case of the qadi's absence, could be made only in Rabat.

Late that afternoon, 'Abd ar-Rahman left Azilal. He stayed overnight in Casablanca and at dawn proceeded to Rabat. As a religious student with little experience of the world beyond Marrakesh, 'Abd ar-Rahman had no clear notion of the hours of government offices. At seven in the morning, he arrived by mistake at the door of the Direction des Affaires Cherifiennes, the French-directed section of the protectorate administration charged with "advising" the sultan and the "Moroccan" ministries, which included the Ministry of Justice. After an hour's wait, a porter (shawsh) arrived and brusquely directed him, in a manner reserved for persons of country appearance, to the Dar al-Makhzan, where the Ministry of Justice was located.

At the Dar al-Makhzan, 'Abd ar-Rahman showed his letter from the Native Affairs Officer in Azilal to another porter and explained the purpose of his visit. So that he would be properly attired for the interview, Ahmad had lent his younger brother a silham, a light cloak worn over the jallaba on formal occasions. 'Abd ar-Rahman had no idea how to wear it, so simply draped it over his shoulders. The porter grabbed it from him and forced it over his head in the proper manner, then directed him to another porter. After another long wait, 'Abd ar-Rahman was ushered into a room with seven Moroccan "scribes" (katibs), seated on low-lying benches arranged along the walls of the room. In a curious attempt to preserve the "authenticity" of the "Moroccan" ministries, the French discouraged desks and chairs.

In retrospect, ‘Abd ar-Rahman admits with amusement that he did not cut an imposing figure. In the rapidly disappearing fashion of a rural religious student, his head was shaved and he wore no turban. His appearance alone was sufficient to amuse sophisticated Makhzan officials. They asked ‘Abd ar-Rahman where he was from, and he showed them the papers he had been given in Azilal. Teasing him, the clerks asked him how a Berber like himself learned to speak proper Arabic. ‘Abd ar-Rahman answered that he had memorized the Quran, so of course he could speak a correct Arabic. Then they asked him a number of historical questions, including the names of the founders of Morocco’s dynasties. The officials clapped their hands each time he answered correctly, saying how pleased they were to find a Berber notary who also knew history. Their other questions were more directly related to notarial tasks, including the fine points of formulaic phrases that notaries used in their work. ‘Abd ar-Rahman was not familiar with all of these, but he managed to answer to the satisfaction of his questioners. Finally they teased him about whether he knew how to prepare a marriage contract, saying that he was too young to be expected to possess such knowledge.

After an hour of questioning, ‘Abd ar-Rahman was told to leave the room. A porter escorted him outside the building to wait a further summons. After an interval, the porter beckoned to him, saying that the Moroccan minister of justice had arrived, but that the French delegate to the Ministry of Justice was not yet present. After another wait, ‘Abd ar-Rahman was called inside and made to sit in a chair between the minister and the French delegate. The minister asked him to read aloud and explain about fifteen lines of a text on jurisprudence. Other questions included explaining the meaning of “to judge” (gada) in Arabic and the six conditions necessary for a qadi properly to perform his tasks.

At first, the “Christian” delegate remained silent.[33] Then he posed, in Arabic, a problem in inheritance (mirath)-. “If a man dies and leaves a full sister (by his mother and father) and a sister by his father only, how is the inheritance divided?” ‘Abd ar-Rahman gave the proper answer: “The full sister was entitled to half, the half-sister to one sixth of the inheritance.” At this point, the “Christian”—‘Abd ar-Rahman could not further identify him—indicated his agreement to the appointment and left the room. The minister then told him that he was pleased with his answers, and informed ‘Abd ar-Rahman that a proclamation confirming his appointment as deputy to his brother would be issued.

‘Abd ar-Rahman left immediately for Casablanca. His older brother was waiting for him there, together with Hasan al-Bu Na‘manl, a poet and a friend of ‘Abd ar-Rahman.[34][35] He wrote a twenty-two-line poem, a qasida, for the occasion, the first line of which reads, “You gave me good news in the morning, then he walked in proudly” (Naba’ ‘atantft as-sabah mubashiran/fa-mashit li-ma an ‘ata mutabakhtiran) (reproduced in as-Susi 1961: xm, 171–172). After their meeting, Ahmad returned to Bzu. ‘Abd ar-Rahman returned directly to Marrakesh to pack his belongings.

As his brother’s unpaid deputy, ‘Abd ar-Rahman’s responsibilities were minimal. He attended all sessions of the court, held in his brother’s house, and acted as overseer for the various lands in possession of his family. As Ahmad was almost never absent from court, ‘Abd ar-Rahman first acted in the place of his brother only in December 1953, when his brother was summarily transferred to the coastal city of as-Swlra (Mogador), where he served briefly as qadi until being removed from the post because of failure to support the French deposition of Sultan Sidi Muhammad bin Yusif.[36]

Once in Bzu, ‘Abd ar-Rahman set about soliciting ijazas from his teachers in Marrakesh and men of learning of his acquaintance. Such documents had become devalued in urban milieus, but they still carried weight in rural settings. ‘Abd ar-Rahman eventually acquired four ijazas, three from shaykhs at the Yusufiya, Mukhtar as-Susi, Muhammad bin ’Umar as-Sarghini, and Mulay Ahmad al-‘Alami. The fourth he acquired in 1938, from the leader of the Kittaniya religious order in Fez, Shaykh ‘Abd al-Hayy al-Kittani.

These ijazas retain a profound meaning for ‘Abd ar-Rahman. He copied by hand each of his letters requesting them, written in the flowery, rhymed prose similar to that of his speech defending Marrakesh, and preserved them carefully along with the documents he received. Since Mukhtar as-Susi was arrested by the French in 1935 and thereafter confined to his natal village in the Sus, signs of association with him might have been construed as incriminating in 1946 and 1953, the two times when ‘Abd ar-Rahman destroyed many of his papers out of fear of imminent arrest by the French. Despite the danger involved, ‘Abd ar-Rahman carefully preserved as-Susi’s ijaza.

As-Susi used the ijazas he wrote for rural men of learning as vehicles to further his views on Islam and Moroccan society. Although the ijazas from ‘Abd ar-Rahman’s two other teachers adhered to earlier forms, listing the qualifications and education of the teacher and the texts studied with the student, as-Susi’s ranged beyond these themes. His ijaza for ‘Abd ar-Rahman is dated z Safar 1354/6 May 1935. It begins by saying that the entire world is changing except for Morocco, which remains in ignorance. Fez and Marrakesh, he wrote, are still asleep, and the men of learning are dying one by one. Religious learning by itself no longer suffices to maintain a sound society. After this unconventional prelude, as-Susi describes the circumstances of his own life. He relates that his father died in 1328/1910-1911, before he completed memorizing the Quran, and he describes his studies at various madrasas in southern Morocco, the continuation of his studies under Bu Shu‘ayb and other scholars during his first stay at the Yusufiya (1919–1923), subsequent studies at the Qarawiyin at the time of the Riffian revolt (1923–1927), subsequent travels, and his return to teach at the Yusufiya in 1929. His style is lively and intimate, even when adhering to the contours of the traditional ijaza. He shapes the genre to his own sense of learning rather than merely perpetuating a received literary form. Although as-Susi uses the third person characteristic of such documents, he infuses the ijaza with personal opinion and reflection. By according similar documents to other rural students attracted by his ideas, he propagated his vision of reformist Islam into Morocco’s smaller towns and villages, an elusive task for most reformists.

As-Susi does not enumerate the books he commented upon when ‘Abd ar-Rahman attended his lesson circles. Such enumerations are, in fact, rare for ijazas written in the 1930s. Due to his frequent travels, his lesson circles were in any case only irregularly offered in Marrakesh. Instead, he lists the subjects studied: grammar, jurisprudence, rhetoric, literature, history, the sayings and actions of the Prophet, and Quranic exegesis. This range of subjects was far beyond the more limited scope offered by most men of learning. As-Susi’s conclusion is unique, for he writes that ‘Abd ar-Rahman is not his student, but his brother. He used similar language in other ijazas.

‘Abd ar-Rahman’s ijaza from ‘Abd al-Hayy is quite different. It is dated 19 Rajab 1357/14 September 1938, when ‘Abd al-Hayy was at the end of a week-long stay in Bzu as part of a protectorate-approved circuit throughout rural Morocco in order to collect donations for his religious activities. Shaykh ‘Abd al-Hayy was then at the height of his powers. A distinguished scholar who also enjoyed considerable popular support, he was also known to be quietly antagonistic to the ‘Alawi dynasty. His opposition to political movements brought him further favor with protectorate authorities, who accorded him privileges they withheld from other religious leaders. His downfall came in the 1950s, when he was one of the principal leaders of the movement leading to the deposition of Sidi Muhammad bin Yusif. In the 1930s, however, his friendship was still desirable. Shortly after his visit to Bzu, he was instrumental in securing admission of ‘Abd ar-Rahman’s half-brother, ‘Abd al-Hayy, to the Qarawiyin (see Chapter Two).

‘Abd ar-Rahman’s ijaza from ‘Abd al-Hayy al-Kittani represents a breakthrough in the vulgarization of the genre. It was a printed form with blank lines for the date, the name of the supplicant, and the books “studied.” Rather than certify the transmission of a designated body of learning from one generation of scholars to another, it took more the form of a certificate of attendance at a lecture by the shaykh. Each night during the shaykh’s stay in Bzu, between the sunset and evening prayers, ‘Abd al-Hayy commented on al-Bukhari’s collection of the sayings of the Prophet. ‘Abd ar-Rahman acted as his reader.

‘Abd al-Hayy’s direct contact with ‘Abd ar-Rahman was thus minimal. He had only visited Bzu once before, and ‘Abd ar-Rahman saw him face to face only twice again. An avid bibliophile, the shaykh visited Bzu again in January 1944, where he remained as a guest of Qadi Ahmad while visiting the nearby zawiya of Ait Umghar and the shrine of Mulay Husayn, a claimed ancestor of the Kittanis. Another reason for the visit was to inspect the manuscripts of the zawiya of Tamanghilt, also close to Bzu. Qadi Ahmad doubled locally as overseer of pious endowments, so he was in a position to oblige the zawiya to allow the inspection of its holdings; he dutifully led ‘Abd al-Hayy there with other men of learning assembled for the purpose. The final occasion was in Fez, where ‘Abd ar-Rahman and his friend, Hasan al-Bu Na‘mani, visited the shaykh’s house in 1944.

‘Abd ar-Rahman proudly identifies himself as a carrier of reformist thought and is skeptical of religious brotherhoods. Yet he respected ‘Abd al-Hayy sufficiently to seek an ijaza from him. His subsequent ambivalence toward ‘Abd al-Hayy, discussed below, suggests both an implicit realization of the practical constraints upon men of learning in a rural context and ‘Abd ar-Rahman’s own emerging intellectual and political maturity.

*** Discerning Islam

Like their urban counterparts, men of learning in rural Morocco were aware of the major intellectual and political movements of their generation. At the same time, they were firmly enmeshed in local politics and society, where prevalent conceptions of Islamic belief and practice were not in accord with either reformist thought or entrenched interests. As unchanging as the image of formal religious learning was to some French observers of the colonial era, this learning was undergoing major internal debate and challenge.[37] This was also the case for more “popular” understandings of Islamic belief and practice (Eickelman 1976). As ‘Abd ar-Rahman matured, his conceptions of Islam underwent transformations that were mirrored in the experiences of many other men of learning in rural Morocco.

In the 192.0s and early 1930s, in Morocco as in neighboring Algeria (Merad 1967: 58–76), reformists saw major threats to Islam in the prevailing participation in religious brotherhoods and in various maraboutic practices, which are based upon the belief that certain persons, living or dead, have a special relation to God that makes them particularly well placed to serve as intermediaries with the supernatural and to communicate God’s grace (baraka) to their clients.

Although reformist Islam received limited support in Morocco in the early nineteenth century (Abun-Nasr 1963), by the late nineteenth century it had emerged as a major influence among Morocco’s religious intelligentsia and received the support of a succession of sultans. In Marrakesh, reformist thought was promoted by influential advocates, including Bu Shu’ayb ad-Dukkali, his student Mukhtar as-Susi, and Muhammad ibn ‘Uthman.[38] Because Marrakesh was under the heavy hand of Hajj Thami al-Glawi, the fusion of reformist thought and nationalist politics that was taking place in Fez in the early 1930s was less publicly apparent in Marrakesh. In Fez, men such as ‘Allal al-Fassi could form a bridge between the traditional world of learning (he lectured at the Qarawiyin) and the early nationalist movement (al-Fassi 1954: 111–136). Nonetheless, no significant obstacles were placed to the spread of reformist doctrines, so long as their advocates refrained from endorsing nationalist aspirations. Many rural students at the Yusufiya were strongly influenced by reformist Islam and carried the lessons of their shaykhs back to their small towns and villages of origin, where they were confronted daily with the contrasts between reformist teachings and prevalent local understandings of Islam. As-Susi and ad-Dukkali, themselves of rural origin, were especially aware of the importance of disseminating reformist thought in

rural areas, and kept regular contact with former students throughout the region by far-flung networks of patronage and influence.

Through studies at the Yusufiya, ‘Abd ar-Rahman became caught up in the reformist movement. At the same time, as the son of a tribal notable and landowner and younger brother of an influential judge, he was aware of the political and economic realities of rural Morocco. In 1976 he recalled:

Until I went to the Yusufiya, I thought that the religious brotherhoods were a part of Islam. In my studies, I read commentaries against the brotherhoods. I began to realize that even the practices of my father were not part of Islam. By the time I left the Yusufiya, I knew that the brotherhoods were an error.

When he first arrived at the Yusufiya, ‘Abd ar-Rahman was himself drawn to one of the religious orders. Many Makhzan officials were members of the Tijani order. He attended some of their meetings and read their literature. What stuck most in his memory was their practice of wearing a shawl (lizar) when reciting the litany (wird) of the order. After a member’s death, the Tijani shawl doubled as his shroud. For ‘Abd ar-Rahman, the symbolic use of such a material object was highly suspect and therefore to be avoided.

For ‘Abd ar-Rahman, some religious orders are more in violation of authentic Islamic practices than others, and must be explained in historical context. His father, he explained, distanced himself from a number of practices almost universal in his generation, such as visits (ziyaras) to maraboutic shrines and the reading of books of the miraculous deeds of maraboutic figures. The Kittani religious order, like the Tijani, attracted adherents from the sultan’s entourage in the early twentieth century. He did not use the dismissive tone for these orders that he reserved for comment on the less exclusive ones. In any case, before and during the protectorate era, Morocco’s rulers gave the leaders of religious orders decrees of investiture, providing them with a cachet of approval. Nonetheless, after his studies at the Yusufiya, ‘Abd ar-Rahman decided that all religious orders deviated to some degree from authentic Islamic practice. He explained his personal opposition to religious brotherhoods by elaborating on the distinction between the path of Islam (ash-shra‘), a term that encompasses both formal Islamic law and accepted Islamic practice, and innovation (bid‘a), for which there is no Islamic precedent. This distinction is integrally related to his sense of history and personal responsibility.

To clarify the distinction, ‘Abd ar-Rahman drew two parallel lines on a sheet of paper. He explained that everything within the lines was shra‘, the path constituted by the Quran and the words and deeds of the Prophet Muhammad, as they are interpreted by Islamic jurists. All other practice—and here he indicated the boundless space outside of his parallel lines—

was bid’a, beyond the pale of Islamic conduct. He further explained that some practices were outside the path of Islam but not directly opposed to it. He penciled a line just outside one of the two parallel lines. He used this notion to explain legislative innovations not contained in Islamic law and the varying degrees to which the practices of religious brotherhoods constituted innovation.

In this conception of Islam, the advice of men of learning distinguished by their knowledge of the religious sciences and “the way things are done” (al-qa’ida) is essential to delineate authoritatively authentic Islamic practice. Such persons ‘Abd ar-Rahman refers to collectively as the elite (nas khassa). They are distinguished by an ability to discern between shra‘ and bid’a. Other persons, even if they are of high political rank, are commoners (‘awam). Those informed by a proper sense of the path of Islam are less likely to be taken in by confidence men (dajjdla) from religious orders or maraboutic shrines, and to be aware of the fundamental precepts of Islamic law governing marriage contracts and inheritance settlements. It is in any case the duty of a Muslim is to seek authoritative advice.

The distinction is not between urban and rural society, although he argues that persons in the country are less likely to have a clear understanding of Islamic practice. To illustrate his argument, he asked me to consider the courtroom comportment of persons of rural origin. In the courtroom, many tribesmen and women have difficulty in explaining the facts of their case in an appropriate form. Their descriptions of incidents are tied to highly local knowledge and they are often unable to describe the timing and duration of events in the abstract, datable form necessary for the application of Islamic law (Davis 1983: 95–97). Compared to town-dwellers, rural persons are less able to perform such a “translation” from locally comprehended descriptions of events, and lack a clear understanding of the specific requirements of Islamic law.

For ‘Abd ar-Rahman, bid‘a exists historically. Before Islam, no one was capable of living by the shra’ because it was not yet revealed, so that everything was bid‘a. Consider, he explained, the state of mystical exaltation (hal), for which some participants in religious orders work themselves into a trance (jadba). He explained that this is a vestige of the time of Sidna Musa (Moses), the prophet “who came before Muhammad offered mankind the keys to the mosque.” After Islam, some people added to Islam practices that do not exist within Islam itself. Muhammad came as the “seal” of the prophets, so that actions attributed to him carry a validity above that of the other prophets, and to which nothing further can be added. Yet the practices that preceded the coming of the Prophet have not disappeared, so the problem remains of how to reconcile them with Islam. He provided as an example the issue of saints (waits) in Islam.

Commoners are ignorant (jubhal). Many of them do not know what Islam is, and what their ancestors did. So someone can tell them a story of the miracles of a marabout and they will be happy.

Only the prophets, including Muhammad and his predecessors, can perform miracles. But there have been men since the time of the prophet Muhammad who are blessed (‘andhum karama) in the sense that they are used as instruments of God’s will. The naive and the gullible in Morocco attribute miraculous powers to certain marabouts, persons whom men of learning regard as distinguished only by piety, lineage, and scholarship. He dismissed the miracle-working powers attributed to Sharqawi marabouts with a wave of his hand.

To ‘Abd ar-Rahman, men of learning are also distinguished from other Muslims through possession of a sense of history that encompasses a knowledge of genealogies (hasab wa-na-sab){see K. Brown 1972: 131), prior rulers and dynasties, and key Islamic events. Although history ‘ta’rikh) refers broadly to a knowledge of all past events and an ability to place them in their proper context, the illustrations upon which Hajj ‘Abd ar-Rahman constantly drew concerned the immediate antecedents of men of power and learning. Knowledge of their genealogies, intermarriages, economic interests, and antagonisms rendered contemporary social action more predictable. Thus he characterized ‘Abd al-Hayy al-Kittani, a religious leader with whose conduct he disagreed strongly, in the following terms:

He was a great man of learning (‘alim kbir). There were few like him in all the Maghrib. His library was one of the finest in the country. He could talk to a man and know everything about him: the name of his father, his grandfather, his ancestors, his brothers. Likewise he knew the history of everyone in the Maghrib.

Along the same lines, the first entries in ‘Abd ar-Rahman’s notebooks after he arrived in Boujad in 1957 are copies of sections of court documents related to Sharqawi kinship relations and property. Such history was directly useful in dealing knowledgeably with persons of influence.

Access to such historical knowledge is most readily available to the elite, who are better qualified to obtain knowledge through chains of reliable, known witnesses. Important knowledge, especially of political events, is often passed only by word of mouth among trusted confidants, signaling its exclusive nature. ‘Abd ar-Rahman explained that the chronicles of kings and the actions of their key ministers were often deliberately obscure in written sources. Everyone is afraid to write of such events. But the oral tradition available to men of learning provides the background necessary to understand events and their significance. Commoners lack access to such knowledge and the ability to assess its veracity.

As an example of such historical knowledge, ‘Abd ar-Rahman explained to me how he first learned of the militant antagonism of ‘Abd al-Hayy al-Kittani to the ‘Alawi dynasty.[39]

I heard this [in the 1930s] from an ex-slave of Mulay ‘Abd al-Hafid [r. 1908–1912.], ‘Abd al-Baqi. Before becoming a slave of the sultan, he was a slave at the zawiya of Sidi Muhammad bin Nasir in Tanaghmilt (Ntifa). Muhammad bin ‘Abd al-Kabir al-Kittani ad-Drlsl was head of the Qarawiyin [and of the Kittaniya order]. He refused to give the oath of allegiance to Mulay ‘Abd al-Hafid unless the sultan agreed to certain conditions. The sultan was angered. ‘Abd al-Kabir fled, together with his wives, family, and servants to the Bni Mgild, a tribe which was then out of reach of the Makhzan and loyal to the Kit-taniyin shurfa.[40] Before he fled from Fez, ‘Abd al-Kabir sent a rosary [tasbih] and a copy of the Quran to the sultan, the traditional tokens for requesting a pardon. The sultan had the slave who carried the message buried alive at night, together with the gifts, so that no one [except presumably the slaves such as ‘Abd al-Baqi who were entrusted with the task] would know that al-Kittani ever sought a pardon.

A document prepared by ‘Abd ar-Rahman just after he was appointed qadi of Boujad (May 6, 1957) gives a practical indication of whom he considered to be men of learning. Since his appointment obliged him to leave Bzu indefinitely—indeed, he subsequently chose to retire in Boujad—he was aware that an era had come to an end. He prepared a list of men of learning who had been entertained at his brother’s house in Bzu from its construction in the 1920s until Morocco’s independence. The heading of the list specifies “ ‘ulama’ wa-shu-rafa’,” but only those shurfa who were also men of learning are included. Most visits occurred in the 1930s, the apogee of the colonial period.

‘Abd ar-Rahman’s list encompassed 130 individuals, all of whom he also described as nas khassa, the learned elite. His list included the leaders of two key religious orders—religious orders retained popular respect in Morocco until the postwar rise of mass nationalism—urban and rural judges, high officials of the Ministry of Justice, a few educated shurfa, teachers at the Qarawiyin and Yusifiya mosque-universities, traditionally educated tutors of the children of Hajj Thami al-Glawi and the royal family, and several urban merchants and pashas (political administrators of principal towns). Most persons on the list were at least moderately wealthy, although there were exceptions. It included an itinerant Sufi (majdilb), dressed in rags, reputed throughout southern Morocco with mystical insight although he never uttered a word. He was assured hospitality at the houses of men of learning throughout southern Morocco. Other exceptions were some of the teachers at the two mosque-universities. Islamic learning had provided them with a means of social mobility. Jewish men of learning, like the French, were not enumerated, although ‘Abd ar-Rahman recalls that one of his elder brother’s respected local friends was a rabbi in Bzu who visited him regularly.

I asked a man of learning who was a contemporary of ‘Abd ar-Rahman but from Marrakesh to evaluate the names on his list. His assessment of who were “really” men of learning was much more restricted than ‘Abd ar-Rahman’s. He dismissed a number of qadis and clerks in the protectorate’s Ministry of Justice as “mere functionaries” who had no more than a rudimentary understanding of the religious sciences. Despite disagreement as to who properly qualified as men of learning, the scholar from Marrakesh used the same implicit

criteria as ‘Abd ar-Rahman: a demonstrated command of Islamic knowledge and its acquisition from men previously recognized as men of learning themselves.

*** Self-Images

When he first visited Bzu, Hasan al-Bu Na‘mani wrote a long, vivid letter to Mukhtar as-Susi, then in forced residence in High, his natal village in the Sus. The letter, dated 14 Jumada 1355/2 August 1936 (reproduced in as-Susi 1961: xm, 174180), was recited to his hosts before his departure. The letter offers vivid insight into the self-image of men of learning, an issue implicit in ‘Abd ar-Rahman’s careful inventory of learned visitors to Bzu. In his letter, Bu Na‘mani writes ironically of France’s protectorate as the “brotherly dictatorship” (al-diktaturtya al-ikha’iya) (as-Susi 1961: xm, 180). The letter alludes to politics, but politics is not its central concern. It is a mixture of circumstantial detail and exuberant literary allusion, so that its audience is self-consciously confined to those who share an awareness of valued literary texts, just as men of learning “possessed” common religious texts.

Bu Na‘mani writes that as soon as he stepped off the bus at the Wad al-‘Abid bridge, where the track to Bzu joined the motor road, he was approached by a servant leading a “superb” riding mule. Indeed, he claims hyperbolically that the servant and the mule were both so distinguished in appearance that they attracted the attention of bystanders gathered at the banks of the river. Later, as he approached “fragrant” Bzu, he discerned villagers standing on a small promontory overlooking the path, with the women ululating in pleasure at his arrival. He finally arrived at the house of Qadi Ahmad, which was also the law court. “Sidi”[41] ‘Abd ar-Rahman, the respected man of letters, waited for him at the door, surrounded by retainers, assistants, relatives, and a crowd of litigants. “Happiness and pleasure overflowed on their faces.” After saying “in the name of God” at the threshhold, Bu Na’mani and the group entered the elegant garden of Qadi Ahmad’s courtyard. It was “as fragrant as a garden of paradise.” Bu Na‘mani assures his audience that even the birds broke out in song for the occasion.

“Then as a sign of great happiness, court was suspended for the day and the litigants dispersed. We devoted ourselves wholeheartedly to pleasures and conversed delightfully on whatever pleased us.” The “us” in Bu Na‘mani’s narrative presumably excluded the litigants, who may not have been entirely overjoyed at having their concerns abruptly set aside in honor of a young poet from Marrakesh. Bu Na‘mani’s “us” also refers implicitly to the elite, in this case formed by men of learning, as opposed to commoners. Citing lines from contemporary Moroccan poets and those of earlier generations, Bu Na’mani narrates that the abundance of literary allusions raised in their meeting “almost swept away dignified bearing” on the part of those present, so intoxicated were they with the occasion. It was the sort of occasion where “brotherhood and forthrightness prevail ... in which princes forget their responsibilities and their dignified countenance before the world, and the modest man of letters forgets his reserve.”

Bu Na‘mani’s letter includes a description of the food he was served, the verses he composed in praise of Bzu during his stay, and the entire letter in which ‘Abd ar-Rahman initially invited him to Bzu. He comments of this letter that anyone reading it would immediately think that it was written by a man of letters from Muslim Cordoba in a playful mood. As for Bzu, Bu Na’mani avers that its beauty, graced by the presence of ‘Abd ar-Rahman and his cultured elder brother, made him forget even Marrakesh. Despite its hyperbole, the letter also conveys informality. Bu Na‘mani even alludes to a concubine provided for his stay (as-Susi 1961: xm, 180).

The letter’s style is self-consciously what Moroccans today call “Egyptian writing,” a style specific to the literary rennaissance (nahda) and proliferation of small literary magazines in Morocco during the 1930s.[42] Although this style bears no inherent correlation to reformist Islam, it was introduced primarily by men of learning influenced by Egyptian thought. This “new literature” (al-adab al-jadid), a term used by as-Susi (1961: xni, 174) to characterize Bu Na‘mani’s letter, is distinguished by references to classical Arabic poetry, especially that of Muslim Spain, and by frequent reference to books and manuscripts by other men of learning.

Men such as Bu Na’mani were in some respects “hired guns,” to adapt Schumpeter’s (1962: 147–148) description of medieval European intellectuals whose fortunes were closely attached to those of their patrons. Bu Na‘mani was not independently wealthy and lived off his wits. Like other men of learning in his condition, the occasional poems and letters he wrote while making the rounds of rural notables were recompensed with presents and lavish hospitality. Letters were his precarious metier. Others made the rounds of men of learning to secure institutional funds. Madani bin Husni, director of the Free School (madrasa hurra) in Marrakesh, an “independent” school established by urban merchants and other Muslims concerned with creating an Islamic alternative to colonial schooling (see Damis 1974), also travelled regularly to rural notables to collect funds for his school. Such visitors enhanced the reputations of rural hosts.

*** Bzu: The Two Faces of Learning

Successful comportment as a notable involved maintaining a delicate balance between competing pressures: competition from other notables, local supporters, the sultan’s entourage, and the French administration. Because Bzu remained a region without significant colonization, the Islamic lav/ court continued to be the primary vehicle for the resolution of land disputes for all lands except those considered “tribal,” which fell directly under the jurisdiction of French authorities. In outlying rural regions, some inheritance and land disputes were resolved without recourse to the courts, although an aggrieved party in an extra-court settlement could always later exercise the option of formally initiating a claim in court.

In a rural setting such as Bzu, there was a constant interplay between a knowledge of the formalities of Islamic law and an understanding of the limits of what could be accomplished in any given context. The Mansuri brothers were credited with a knowledge of the precepts of Islamic law and of accepted local practice (al-qa'ida), together with the "social rationality" or "reason" ('qal) to resolve disputes equitably. Hence the work of qadi was conducted on two levels, that of Islamic law and that of local understandings of what was right and just. A qadi was not just a functionary, as he has too often become in contemporary Morocco; his sound knowledge of the law was combined with an understanding of local society. Quite often much of the work of the qadi consisted in advising persons on how to conduct themselves in accord with the precepts of Islam so as to avoid resolution of their disputes in court. Continuing the tradition of their father, the Mansuri brothers were respected for their willingness out of court to help their clients reconcile what they considered their rights with what was accorded them by Islamic law.

As carriers of religious knowledge, respected by men of learning and by persons in political authority, the Mansuris were treated with deference in Bzu. They were also respected as landowners and local functionaries. In the 1930s, as in preceding decades, marriage continued to be an important means for cementing political bonds. Qadi Ahmad's first marriage in the early 192.0s was to the daughter of a local tribal shaykh and landowner. His second marriage in 1353/19341935 was to a daughter of the qaid of Ntifa, the same one with whom Ahmad's father had a serious dispute a decade earlier (see Chapter Two). In 1941, at the suggestion of his elder brother, 'Abd ar-Rahman further solidified this tie by marrying another daughter of the same qaid. These links provided the Mansuri brothers with the outside support they needed to maintain their local preeminence.

[[d-f-dale-f-eickelman-knowledge-and-power-in-morocc-6.png][Figure 3. 'Abd ar-Rahman, 1939.]]

The Mansuri brothers were wealthy by the standards of the Marrakesh hinterland, but not extragavantly so. By the late 1930s they had acquired roughly 400 hectares (988 acres) of land and sizable livestock herds. They introduced mechanized agriculture and motor pumps for irrigation to some of their fields, and possessed two automobiles.

A major advantage of being considered among the "known people" (nds ma'ruftri) was a greater security of property. Title to lands in much of the Bzu region was by rasm, written agreement between buyer and seller drawn up in accordance with the tenets of Islamic law. The land involved in such transactions was often specified by local names, with actual boundaries known to members of the community rather than formally specified. When disputes over the actual limits of such land occurred, they could be resolved only by persons already familiar with the parcels of land in question and the validity of the claims of documents and witnesses to the land in question. In

adjudicating such disputes, judges relied inevitably upon the word of shaykhs and local notables. In the Bzu region itself, Qadi Ahmad was clearly the ultimate arbiter.

Unlike other parts of Morocco, virtually no land around Bzu was registered by the Torrens system of land registration, introduced by colonial authorities. Under the Torrens system, persons wishing to claim title to a plot of land register their claim, which is then surveyed to determine precise boundaries. Official notice is then given of the claim. Prior or conflicting documents are examined to evaluate their validity. All documents are registered in one central place, so that a single search reveals the status of a title. Registration of land under the Torrens system is known among Moroccan notables as possession by titre-, the French term is used. In principle, possession of a Torrens title greatly reduced the possibility of boundary disputes. Yet as ‘Abd ar-Rahman pointed out, notables rarely needed such protection. In fact, there was a clear disadvantage to holding a Torrens title, for it left no ambiguity over the extent of holdings for taxation purposes. Official French reports gave the extent of the Mansuri family’s property at roughly half of what they actually possessed. Such ambiguity was an unintended advantage of maintaining title whenever possible under Islamic law.

Prestige and authority exist to the extent that they are publicly displayed and reaffirmed. The attention given by rural notables to attending wedding feasts, funerals, and other significant gatherings of notables served not only to confirm patterns of practical domination, but sought to reaffirm it to outsiders. As ‘Abd ar-Rahman explained, having a constant flow of visitors to one’s house and visiting notables elsewhere lets one know what is going on in the world. The search for information and ability to obtain and recognize firm “news” (C. Geertz 1979:198–212) is facilitated when one is a notable. Whenever decisions had to be made affecting Bzu, the Man-suris were consulted and their advice heeded. Through regular patterns of reciprocal visiting, notables became apprised of one another’s interests and the practical limits of what was possible in current political situations. By the late 1930s and early 1940s, ‘Abd ar-Rahman began visiting other urban centers and rural notables on his own, at times in the company of his friend, Hasan al-Bu Na‘mani.

A sense of the scale and importance of such feasting is provided by the marriages of Ahmad in the mid-193 os and ‘Abd ar-Rahman in 1941. For Ahmad’s wedding, ‘Abd ar-Rahman recorded the name of each prominent guest, together with the present given to each of them, a varying mixture of cash and locally made Bziwi jallabas. The guests included qaids, qadis and their deputies from the regions adjoining Bzu; the deputy pasha of Marrakesh, Captain Ben Daoud, an Algerian-born military interpreter who was also editor of the protectorate newspaper, as-Sa‘ada (“Happiness”) (distributed free by colonial authorities to all persons designated as notables, and hence itself a minor indicum of status); several members of the Glawi family (although not the pasha himself); teachers from the Yusufiya; and key officials in the Ministry of Justice. ‘Abd al-Hayy al-Kittani and Bu Shu’ayb ad-Dukkali both declined invitations to attend, but were nonetheless sent gifts, one jallaba for ad-Dukkali and three for al-Kittani. The total expense for the wedding was carefully recorded as 5,644 Hassani ryals. French colonial authorities and local Jewish notables were also present, although ‘Abd ar-Rahman did not record their names. Nine

thousand ryals were spent on a 1937 visit by ‘Abd al-Hayy al-Kittani, and 160,000 for a visit of Sultan Muhammad bin Yusif to nearby Tamghalt, a visit hosted by the Mansuri brothers, in 1950.

‘Abd ar-Rahman’s own wedding is carefully reported in articles that appeared in issues 5,429 and 5,430 of as-Sa‘ada, dated December 27 and December 28, 1941. The categories of notables attending the wedding and the geographical range of invitees parallel those present at the wedding of his elder brother. As-Sa‘ada reported that wedding guests were entertained throughout a month. The newspaper estimated that food for the wedding guests was provided through the slaughter of 800 sheep and 300–400 cows. These indications of scale are perhaps more significant than attempts to assign specific monetary value to the proceedings.

As an example of how the Mansuri brothers used their ties with other notables to defend their interests, a serious conflict developed between Qadi Ahmad and a new official appointed as overseer for pious endowments.[43] Shortly after being appointed qadi of Bzu in 1926, Ahmad Mansuri was given the additional appointment of overseer of pious endowments for the Bzu region. His letters of investiture from Sultan Mulay Yusuf (r. 1912–1927) for both posts were renewed when Sidi Muhammad bin Yusif assumed the throne in 1927. Ahmad continued to hold both posts until 1943, when the colonial government decided that henceforth no official could hold two posts simultaneously. This move coincided with a long-delayed implementation of an earlier reorganization of pious endowment administration in the region. A single overseer was appointed with responsibilities for the entire region of Marrakesh and Ntifa. Unlike his illiterate predecessor, the new overseer was literate and reasonably effective, and actually secured support for extending his effective control over the hinterland of Marrakesh. Qadi Ahmad remained as deputy overseer for the Bzu region, an unpaid position. Former overseers in other regions, often qadis, likewise continued as unpaid deputies.

The new overseer, from an influential family in Marrakesh, at first had the support of Qadi Ahmad. According to ‘Abd ar-Rahman, when the new overseer was first appointed the Mansuri brothers considered him to be “close” to the sultan, in the sense of being in his favor. The man dressed poorly to indicate his humility and lack of avarice, and was himself considered to be a man of learning. Soon after his appointment, however, ‘Abd ar-Rahman claimed that he began to exploit his office for personal gain.

In 1942. Qadi Ahmad acquired land in Marrakesh. On part of this land he constructed a funduq, an all-purpose caravanserai used for merchants’ stalls, stored goods, stables, and, in this case, rooms for religious students. Its construction was completed in 1944. The overseer decided that he wanted to acquire Qadi Ahmad’s Marrakesh property for himself. The land does not appear have fallen within his official jurisdiction, despite the fact that Qadi Ahmad allowed the hostel to be used in part to lodge religious students. He successfully acquired the land and the funduq. From the point of view of the Mansuri

brothers, this was because he was supported by the French administration, with which the Mansuris were beginning to have difficulties. The dispute flared into the open and lasted for two years. After complicated maneuvers involving multiple intermediaries, this dispute and other outstanding ones were finally resolved in 1946 by Hajj Thami al-Glawi in the course of a personal visit to Bzu, during which he, of course, had to be suitably entertained. Qadi Ahmad failed to recover his lands in Marrakesh, but the pasha brought an end to the harrassment of the Mansuri brothers by local French officials, an objective that by then was more significant than lost property in Marrakesh.

*** The Responsibilities of Learning

If a man of learning stands out because of his better knowledge of the straight path of Islam and of the skills needed to discern this path, I asked ‘Abd ar-Rahman, then what is his responsibility toward his fellow Muslims? His reply was a paean to personal autonomy:

A Muslim’s duty is just to show the path to those who want to be with God, and that is that. Either they take it or leave it. The prophets allow them the choice. There is paradise and there is hell, and God selects who goes to each (see also Eickelman 1976: 116–130).

‘Abd ar-Rahman’s notion of responsibility focuses upon the social rationality of individuals regardless of economic class, their ability to discern their status and to act realistically in the context of contemporary society. As pointed out in Islamic contexts elsewhere (e.g., Kessler 1978: 2,11), such a notion of responsibility is profoundly asocial in the sense that the Islamic ideal is to be realized through individuals each improving his own conduct. There is no clear sense of collective goals short of those to be realized by the entire Islamic community. Such a conception of responsibility does not lend itself to a direct or central involvement in politics, although ‘Abd ar-Rahman recognized that the political context in which the shra‘ is realized is important, if only because political authorities, both in the colonial era and subsequent to it, have had the capacity to thwart Islamic practice.

Even within the sphere of “nonpolitical” Islamic practice, the responsibilities of men of learning are circumscribed. ‘Abd ar-Rahman described his only direct confrontation with ‘Abd al-Hayy al-Kittani:

In 1944 I went with my father to a big reunion of the Kittaniya in Fez. Followers came from all over the Maghrib—Tunisia, Algeria, and Morocco. Many of them were beating themselves, like my father did, and some went into trance. I said nothing. After all, my father and I were guests in the house of Shaykh ‘Abd al-Hayy and most of the people there were under his authority (imra).

Finally, although I was the shaykh’s guest, I said to him that I had read an account of the orders which argued that the very practices I had seen that day in Fez were bid‘a, beyond the limits of Islamic conduct. ‘Abd al-Hayy replied: “No. These practices help people to remain on the path of Islam.” I replied: “Tell me [how]” (‘allimm). The shaykh did not reply. We did not return again to the subject.

‘Abd ar-Rahman’s direct challenge to the shaykh was contained in the public utterance of precisely one word, ‘allimni. I raised the question of why he did not further pursue the issue if he felt so strongly about the pernicious influence of brotherhoods. He replied that both he and Shaykh ‘Abd al-Hayy were aware of their entrenched and divergent views. ‘Abd ar-Rahman was moreover aware of the vastly superior status of the shaykh. Direct confrontation would have accomplished nothing. A futile display of anger or a persistent attempt to persuade a person irrevocably committed to a course of action to change his mind would display a lack of “reason” in the social arena. “Reasonable” men do not stand on absolute rights and wrongs. They seek to discern accurately the contours of existing social and political realities and on this basis calculate an effective course of action (see Eickelman 1976: 130–138).

In ‘Abd ar-Rahman’s view, there was also ample precedent for men of learning to cooperate with political authorities, even if they were French, provided that the wishes of the sultan and the principles of Islam were respected.

There is a saying of the prophet that we must obey God, the Prophet, and persons of authority (ahi al-amr). Ahl al-amr here in Morocco means the sultan.[44] So if the sultan decrees something which is not in the shra‘, I must nonetheless judge by it.

I then asked ‘Abd ar-Rahman whether he felt that some of the laws by which he conducted his court were therefore bid[45] a.

The sultan does not issue decrees on his own. He tells us that the decree prohibiting the division of inherited lands below a certain size is in the interests (maslaha) of promoting agricultural development. He also decrees that according to doctors it is not good for women to have children before they are fifteen because they are not yet ready. I married my wife when she was thirteen, well before the new decree, and her first two children died. So perhaps what the doctors say is true. Still, some women can have babies early. I heard on the news yesterday that a nine-year old American girl gave birth, but doctors say that most women cannot. So our decree says that if a woman does not get a paper from the doctor saying that she is at least fifteen years old, a judge cannot declare her marriage valid. It is in the interest of the woman that the decree is made.

Moreover, when the sultan issues a decree, first he consults with fifteen or twenty men of learning. So if the sultan wants a decree which is against the principles (qawa'id) of Islam, he cannot get it because he will find no men of learning willing to say that the decree is not contradictory to Islamic principles. So the sultan cannot issue decrees which are against Islamic law.

The sophistry of the ruler being unable to legislate against the shra' is arguable in practice. After all, some men of learning, including 'Abd al-Hayy al-Kittani, signed the Glawi's petition calling for the deposition of Sidi Muhammad bin Yusif in 1953. Yet there are cases in recent Moroccan history in which the interpretations of men of learning have been used to legitimate opposition to the express wishes of the ruler. The most dramatic case in recent Moroccan history was the opposition to the new Moroccan constitution by the scholar Mulay aPArabi aPAlawi, a sharif, student of Bu Shu'ayb ad-Dukkali, and tutor to the nationalist leader 'Allal al-Fassi. He opposed the constitution's endorsement of primogeniture in dynastic succession and a legislative assembly (see Waterbury 1970: 44, 92). He was not successful, but his objections were given wide publicity by those opposed to the constitution.

For 'Abd ar-Rahman, the implementation of Islamic law, not Islamic law itself, changes to accommodate political realities. He and his brother were not men of authority (sulta) in the sense of themselves making explicit political decisions. In times of acute crisis under the French, they sought to influence the political conduct of others by withholding support, not by actively working against the colonial system. For precedent they frequently cited the conduct of the monarch himself. Beginning in the late 1940s, political activists in the Istiqlal and other parties labeled such persons as "mystics" (sufis), using the term in a context which implies that they remained aloof from political activism.

The nationalist claim that men of traditional learning were "mystics" or "non-rational" (Waterbury 1970: 92) in this sense is incorrect. 'Allal al-Fassi, for example, despite his years as a student and teacher at the Qarawiyin, had developed significant contacts with both French opposition parties and Moroccans familiar with European political ideas (al-Fassi 1954). Their political ideas often paralleled those of their European and colonial counterparts, although their goal became liberation from European rule. Traditional men of learning recognized the fact of European political and technological superiority and resented it. Their response, however, was to address what they considered to be the most basic issue facing the Islamic community, to recapture its former momentum toward progress through internal discipline and educational reform (Binsa'id 1983: 32–35). When traditional men of learning were directly challenged, as they were with the deposition of Sidi Muhammad bin Yusif in 1953, an act that stripped all pretense of legitimacy from French rule, they were capable of courageous action.

** Six: Politics and Religion: From Protectorate to Independence

*** The Berber Decree

Explicit political challenge to colonial rule began to crystallize in 1930. The challenge was initially formulated as a religious one. The Berber Decree formally extracted certain Berberspeaking areas of Morocco from the jurisdiction of Islamic courts, submitting disputes to customary law courts instead. The decree was issued on May 16, 1930. The first demonstration against it took place in Sale, Rabat's twin city, on June 20, 1930. Kenneth Brown's (1973) excellent account of the event, based in part upon interviews with participants, 'Abd ar-Rahman's contemporaries, makes it clear that the leadership was almost entirely in the hands of the sons of the town's elite, both those who were attending French schools and those with a traditional education. They shaped their protest in religious terms that won widespread popular support.

The protest took the form of public recitations of the latif, a collective invocation to God in times of disaster or distress. The issue was framed as one of purification of the Muslim community, in this case from a disaster attributable to rule by non-Muslims, the Berber Decree. The latif was a form of public gathering understood by all generations of Moroccans. Soon other cities throughout Morocco followed the lead of Sale. Marrakesh was an exception. For 'Abd ar-Rahman, ignorance was to blame, although the fact that his brother warned him to stay away from imminent demonstrations for fear of arrest suggests an equal concern with political reprisals. Few people in Marrakesh could then read or understand what the French were doing. Fez was burning with reaction to the proclamation. In Marrakesh, we read the newspapers [prohibited by the French], but did not know what they meant. The [Berber] proclamation was against the shra', but we didn't realize that at the time. Besides, the city was under the firm hand of the Glawi. Anyone who went against him risked certain imprisonment.

When I pressed him on why he did not seek to explain to people in Marrakesh the implications of the Berber Decree if indeed they were unaware that it was a threat against Islam, he replied that his primary concern was his religious studies, which participation in political activity could bring to a sudden end.

'Abd ar-Rahman nevertheless shared with the early nationalists the sentiment that Islam was threatened. Before he left for studies at the Yusufiya, he remembers once having visited a small, French-run school. He recalls the older boys at the school smoking, allowing their hair to grow, and knowing nothing of the Quran. "They had lost Islam." Despite Lyautey's earlier efforts to create an amalgam of French and Islamic education for notables, French educational efforts were regarded with mistrust. Colonial rule was an attack upon Islam, and it was in these terms that French rule was most readily understood. For many educated urban youth of his generation, the shift to proto-nationalist activities began in the early and

mid-1950s. For ‘Abd ar-Rahman this shift never took place, although he was intimately aware of nationalist activities and goals.

So long as the fiction of respect for Islam and the formal consent of the sultan could be maintained, the French had the acquiesence of most men of learning. Once that fiction began to crack in the late 1940s with a series of open confrontations between the Palace and the Residence, the days of French rule were numbered.

*** The Colonial Apogee

Colonial rule unintentionally strengthened the networks linking educated rural notables. The size of rural administration during the colonial era was admittedly miniscule in comparison with the burgeoning bureaucracy of the postcolonial era, but it nonetheless provided a number of previously unavailable sinecures for the traditionally educated.

The French vision of rural Morocco was that of a honeycomb, with the notables within each cell jockeying over matters of local import (Montagne 1941: 19; Gellner 1973: 367368). The French, by favoring what one intelligence officer called the “natural leaders” (Berriau 1918: 4–5) within each ceil, supported those local notables whose interests could be made to articulate most closely with their own. In this French vision, the highest local Moroccan official, the qaid, would only communicate officially outside of his cell through a French Native Affairs Officer {hakim) or Civil Controller [muraqib), the lowest officials in the French native administrative hierarchy. Consequently all communications between the sultan and his appointed local officials were to be brokered through the French administration (Gellner 1973: 367–368).

French understanding of Moroccan rural society neglected the pervasive transregional ties of patronage and influence among notables and men of learning, which could be used to subvert the official French hierarchy. Rural notables easily remained abreast of major political developments throughout Morocco and the Islamic world, often obtained access to confidential French documents concerning themselves, and circulated banned newspapers with ease. Especially after relations between the sultan and the French deteriorated in the decade following the Second World War, local notables devised means of regular communication with the Palace that evaded French control.

In discussing the Mansun brothers in the 1970s, some urban-born scholars in Marrakesh described them to me as modest country fqihs who like others of their kind owed their careers to collaboration with the French. Moroccan intellectuals, like others, are capable of judging past actions through the simplified prism of the present. The Mansuri brothers, together with many other men of learning of their generation, collaborated with the men of authority. In doing so, they followed the lead of their monarchs, a succession of whom

accepted French “tutelage.” When the ruler began increasingly to chart a course independent from that of the French, the Mansuri brothers continued to follow his lead, often displaying personal courage.

In 1962–1963, a schoolteacher from Tetouan, capital of Morocco’s former Spanish zone and a center of learning, asked Qadi Ahmad to prepare a tarjama, so that his participation in the events of the early part of this century would be recorded in his own hand. Unlike many of his contemporaries, Qadi Ahmad did not rewrite his personal history to conform to contemporary fashion. It did not omit his role in organizing the first rural tax and the “pacification” of the Ait ‘Tab, an act which in his view averted unnecessary bloodshed. The tar jama omits only the fact that he was awarded a colonial medal for his actions. It is admittedly somewhat self-serving in recounting how a local Native Affairs officer in 1953 recognized Qadi Ahmad’s integrity and therefore successfully recommended against sending him to prison, the fate of many other notables courageous enough to refrain from publicly supporting the sultan’s exile to Madagascar in 1953.

The tarjamas of many of Qadi Ahmad’s contemporaries often downplay the significance of their involvement with the French. An example is provided in as-Susi’s (1961: ix, 3537) compendium of men of learning in the Sus. According to one entry, when in 1914 the French conquered the region in which Sidi Ahmad al-Ahrlyi al-Tajarmunti (b. 1897) was teaching, they saw his excellence in spite of his youth. “Humbly and deferentially,” the French invited Sidi Ahmad’s cooperation. The tarjama then depicts a career in which the scholar first was obliged to assist the French in making a survey of land ownership in the region, then returned to religious teaching, a second interval of unspecified work for the French, and finally a return to madrasa teaching. Since the scholar was compelled to cooperate, he is freed of responsibility.

As was the case with most rural notables, the tenor of Mansuri relations with French authorities changed significantly over time. Through the 1930s, relations remained correct and reasonably cordial. Reports of Qadi Ahmad’s activities in the “heroic” early days of the protectorate were faithfully passed along to new administrators in his confidential intelligence dossier.[46] As is standard in such reports, his politically important family ties are listed as are his properties, although as mentioned in Chapter Five, the size of his agricultural holdings and herds are underreported by roughly half: four houses, fourteen gardens, two hundred hectares of cultivated land, two mules, fourteen cows and four hundred sheep. The report continues that Qadi Ahmad is distinguished in his knowledge of Islamic scholarship and possesses a “first class diploma” [sic] from the Yusufiya. “He knows Arabic literature and is informed on modern social life. He is considered to be a just qadi and is respected, enjoying a major influence in the entire region. He is helpful toward the French and has the aptitude to be appointed a qadi in a city or a qaid in a rural area.”

*** The War Years

Protectorate rural administration worked reasonably well until the Second World War. Many civil and military administrators were rapidly trained to replace officers who refused to serve with Vichy or who had earlier chosen to return to France for active military service.[47] More important than the declining quality of available administrators were the economic and political dislocations of the war years and a renewed impetus to the nationalist movement from the realization that the French were not invincible.

In the course of our discussions, ‘Abd ar-Rahman was the first to raise the subject of the declining quality of French administrators in the war years. He observed that the French began to recruit their officers from a different category of persons in France. My notes on August 28, 1969 record:

He asked me whether there wasn’t an equivalent to shurfa in France, who all had pierced ears so that they could recognize one another. I asked him whether he ever saw an A.I. officer or civil controller with a pierced ear. ‘Abd ar-Rahman replied that he had not, but only “heard” that French shurfa had distinguishing marks. I tried to explain as best as I could the hidden marks of social class in France—language, style, and attitudes toward society.

‘Abd ar-Rahman’s concept of divisions in French society, like his perceptions of the European war, “the fuss in Europe” (as-sda‘ fi-‘uruba) is imperfect. European society is at the periphery of his social imagination, and is as blurred as counterpart French colonial visions of the Moroccan social order. In contrast, his comments on French local policy during the war years are concrete and precise. ‘Abd ar-Rahman says that the “non-shurfa” administrators of these years had orders to follow the lead of local qaids, who were assumed to know how to “handle” the populations under their jurisdiction. After the defeat of France by the Germans, colonial officials were also concerned that an uprising against colonial rule might occur in Morocco.[48]

Whatever the deficiencies of personnel assigned to rural posts in Morocco during the Vichy years, the officer in charge of the Azilal post for seven years beginning in 1941 achieved the grudging respect of the Mansuri brothers. A surviving fragment of ‘Abd ar-Rahman’s diary, written on March 4, 1948, the day that Captain Fist left Azilal, describes the hakim as a “human devil” (insan min ash-shayatm), the only instance in which such extraordinary language occurs in his writing.[49] According to the diary entry, Captain Fist was a fencer and skilled horseman, married to an “American.” This is an extraordinarily remote possibility for a French colonial officer of the period. Given the presence of Americans in Morocco after the Allied landings, ‘Abd ar-Rahman appears to have assumed that all non-French foreigners of the period were American. Fist was so fluent in classical Arabic that he could speak for half an hour without error or pause.

Although recognizing his extraordinary qualities, the diary also describes Fist as perfidious ‘fih al-khda‘). He introduced a network of spies and informers into the region,

held back the distribution of some ration coupons to sell them on the black market and, despite the presence of his “American” wife, cavorted with dancer/prostitutes {shaykhat). The quasiheroic and contradictory qualities attributed to Fist indicate how peripheral the European presence was to the society and administration as experienced by ‘Abd ar-Rahman, despite the fact of colonial political and economic domination.

It would have been difficult for any Native Affairs officer to have been liked by tribesmen or notables as political and economic conditions progressively deteriorated. The use of corvee labor was intensified. To feed France and Morocco’s urban population, Vichy introduced food rationing, even to rural regions, and requisitioned crops and livestock against paper money that was almost worthless because there was nothing to buy with it. The black market flourished, often with the connivance of local officials. Whatever the alleged deficiencies of Fist’s character, ‘Abd ar-Rahman grudgingly admitted that the captain knew with precision what occurred in his jurisdiction and extracted the maximum resources from it.

The Mansuri brothers had had reasonably good relations with earlier local officials. With Fist, there was animosity from the beginning. Once the captain’s coolness toward the Man-suris became public knowledge, those engaged in land disputes and other quarrels with them initiated denunciations, often anonymous, against them, knowing that they had a receptive audience. Cordial relations with earlier officers had insulated the Mansuris from such attacks.

An initial cause of contention between Fist and the Mansuri brothers was a late-model Dodge that Qadi Ahmad imported just before wartime restrictions were imposed. At the time, only the sultan possessed the same model of automobile in Morocco. Because of fuel rationing, Qadi Ahmad put the Dodge up on blocks and used another, smaller vehicle that consumed less fuel. Later, when the sultan required a spare part for his own vehicle, he sent his chauffeur to Bzu for it. Qadi Ahmad willingly stripped it from his car. Fist was furious. He wanted the Dodge for himself. Fist cut off the food rationing coupons of the two brothers. A Jewish merchant in a nearby town managed clandestinely to deliver food to them in the night.

Qadi Ahmad responded in kind. He wrote an anonymous letter denouncing Fist to his superiors. Because of restrictions on travel and the risk of immediate detection if the letter were mailed locally, Qadi Ahmad gave the letter to a Bzu merchant with a travel permit, who posted it in Casablanca. Fist suspected the Mansuri brothers of orchestrating local protests against his conduct, an act that he regarded as sedition (fitna).

One reason for his suspicions were the brothers’ informal communications with the palace. Especially after his meeting in Anfa, near Casablanca, with Roosevelt and Churchill on January 22, 1943 (Hassan II 1978: 29–30), the monarch disregarded official channels for communicating with local officials and contacted them directly. On January 11 of the

following year, the leaders of Morocco's Istiqlal (Independence) party gave the monarch a copy of their manifesto, which included the demand for independence. Under intense French pressure, Sidi Muhammad bin Yusif issued a statement that the word "independence" should not be used. The Istiqlal party, which until that year had received its support primarily from the urban bourgeoisie, began to achieve a much wider base of popular support. Recognizing this, the French initiated a wave of arrests in February 1944, which included a number of prominent men of learning (Julien 1972: 198–199). Despite French intimidation, the ruler maintained informal channels of communication. An unsigned note on fine paper dated October 31, 1945, summoned Qadi Ahmad to the sultan in Rabat, just as the sultan summoned scores of other local notables to take measure of his support. It also said that the king "was pleased with his actions and aware of what Hajj Ahmad was doing," a sentiment ambiguous enough to withstand possible French interception. The Qadi traveled to Rabat without formal permission from the French, thus earning more censure from local authorities.

In 1944 there were violent pronationalist riots in the major cities. The French suspected collusion between the Palace and nationalist leaders, and there was a wave of repression in which both nationalist leaders and men of learning were interrogated and imprisoned (Bernard 1968: 24). The accusation of suspected nationalist activity, like the legal offense of having a mauvais esprit, was increasingly used as a tool of intimidation by colonial authorities, who now had added pretexts to intervene in local quarrels. Fist received letters denouncing the Mansuri brothers for giving money to 'Allal al-Fassi and the Istiqlal movement. 'Abd ar-Rahman says that they never made such contributions, but his brother's contacts with the palace and refusal to denounce local nationalists led them both to be suspect. By late 1944, open hostilities between Fist and the Mansuris were attenuated by a personal visit from Hajj Thami al-Glawi to Bzu, said to be acting on instructions from the monarch. Hajj Thami arranged a reconciliation between Fist and the Mansuri brothers, and brought an end to several other outstanding disputes in the region.

'Abd ar-Rahman's surviving notebooks for the 1944–1946 period contain a mixture of information on local events and radio news: the end of the Second World War in Europe (May 8, 1945), the resignation of De Gaulle (January 21, 1946), and commemorative verses written by men of learning. The most striking element of the diary is its relentless recording of local economic conditions. It is difficult to provide meaningful conversion figures for the rapid fluctuations in currency in the last days of Vichy, but the dramatic escalation of prices as commodities disappeared from the market indicates the increasing gravity of the situation.

A prolonged drought and famine in 1945–1946 exacerbated conditions. 'Abd ar-Rahman's penciled diary entries record the lack of rain, massive crop failures, and the widespread death of animals and humans from starvation and typhus. In the immediate vicinity of Bzu, he records that 5,000 persons died between 1941 and 1944 (1360–1363). When finally rains fell for a week in 1944, they were immediately followed by an attack of locusts that stripped even the bark from trees. Despite these hardships, the French intensified the corvee and requisitioned the meager crops of olives and oranges. In famine conditions, law and order broke down. Tribesmen took to killing travelers, and no one was brought to justice. By early

1946 in the Ntifa region, 11,000 deaths were attributed to typhus. Pestilence took over from hunger and cold as the leading cause of death. Some wealthy merchants and notables made enormous profits from the black market during this period. Others, especially during the 1945 famine, massively expanded their landholdings by purchasing land and houses for a few measures of grain, turning tribesmen into sharecroppers and townsmen into tenants.

Table 4. Price Increases in Bzu, 1942–1944

| Commodity | Unit of Measure | 1942 | 1944 | Inflation Rate (%) |

| Barley | ‘abra{3} | IO F. | 1,000 F. | 10,000 |

| Wheat | ‘abra | 200 | 1,500 | 750 |

| Mutton | kilo | 10 | 150 | 1,500 |

| Chickens | each | 15 | 22.5 | 1,500 |

| Sugar | kilo | 7 | 2,000 | 28,571 |

| Tea | kilo | 30 | 400 | 1,333 |

| Olives | kilo | IO | 250 | 2,500 |

| Lard | kilo | 15 | 250 | 1,667 |

| Honey | kilo | 20 | 250 | 1,250 |

| Candles | each | 3 | 100{4} | 3,333 |

| Charcoal | kilo | 2 | 100{5} | 2,500 |

| Cotton fabric: men’s clothing | meter | 2 | 3,500 | 175,000 |

| women’s | | 6 | {6} | |

| “Heavy” textiles | meter | IO | 800 | 8,000 |

| Silk (black market) | meter | 10 | 7,500 | 7,500 |

| Sargha (cloth for jallabas) | meter | 150 | 5,ooof | 3,333 |

| Iron Balgha (trad, shoes): | kilo | 2 | 50 | 2,500 |

| Men’s | pair | 30 | 750 | 2,500 |

| Women’s | | 40 | 2,500 | 6,250 |

{3} Lit. “measure.” A local measure used for cereals; equivalent to 12 kilograms in Bzu.

{4} Subsequently disappeared from the market.

{6} Ibid.

Source: Diary of Hajj ‘Abd ar-Rahman, 1944.

Conditions improved after September 1945, when food and seeds provided by American aid began to be distributed through the colonial administration. ‘Abd ar-Rahman wrote in his diary in that month, “Because of the great dollar, people were freed from famime. People thanked God for what the Americans did and recognized the greatness and goodness of the American empire” (dawla). He also wrote a qasida in praise of the occasion. The price of wheat fell from 1,5 00 francs to 750 francs, and that of barley from 1,000 francs to 45 francs.

The Fist era came to an end precisely on March 4, 1948. On that date he summoned the notables of the region to Azilal—shaykhs, qadis, and qaids—and ordered the qaids to bring tribesmen on horseback. French officers from other regions were also present. Fist reviewed the assembly, shook the hand of each in farewell, and then provided a lunch for the notables. ‘Abd ar-Rahman’s diary records that the real celebrations began once he left the region.

*** Postwar Nationalism

For a brief period after the Second World War, especially during the tenure of Eirik Labonne as Resident-General (19461947), colonial policy became liberal and reformist. Agricultural development schemes were initiated and major efforts were made to expand facilities for health and education. Pressure from colons and the more conservative elements of the colonial administration soon eviscerated the most basic reforms, especially efforts to

modernize indigenous agricultural production (see Berque and Couleau 1946; Bidwell 1973:228232). _

A key political event reflecting changed Moroccan sensibilities toward colonial rule was a speech delivered by Sidi Muhammad bin Yusif in Tangier on April 10, 1947, the text of which had been submitted under pressure to the French for prior approval. Three days before the king's speech, Senegalese troops in Casablanca opened fire on demonstrators, leaving hundreds of casualties. When the king delivered his speech in Tangier, he left out a phrase praising the French Julien 1972.: 311). Moroccan nationalists enthusiastically welcomed this first public indication of the king's opposition to the French. On May 14, 1947, Labonne was replaced as a consequence of this incident by General Alphonse Juin, who sought through vigorous police action to suppress the nationalists and to compel the Palace to disown them. Under intense pressure, the monarch agreed to restate his loyalty to France, but refused to speak against the nationalist movement. Repression intensified and Juin became increasingly impatient with the silence of the palace Julien 1972: 324–326).

The main consequence for Bzu of the brief postwar liberal interlude were plans to expand the French administrative presence, which, however, were implemented only after the return to more repressive colonial policies. In June 1949 a Captain "Boeuf" arrived in Bzu. In addition to overseeing construction of the new administrative center and adjacent houses for government employees, he supervised construction of a bridge for one of the major access roads to the Bzu market and set up Bzu's first electric generator. It provided electricity for the administrative center, a school, and a few nearby houses for civil servants. Boeuf amazed villagers by performing manual labor alongside his workers, and paid wages rather than relying upon the detested earlier practice of the corvee.

The administrative center was officially opened on December 12, 1949. A feast marked the occasion, attended by the Moroccan notables of the region and key regional French officials: "Talig" (Bni Millal), "Alexandre" and "Gamsi" (Azilal) and "Doyen" (Tanant). The qaid of Azilal had until then successfully opposed the opening of additional French administrative centers, correctly sensing that an expansion of the French administration would diminish his own influence. Prior to 1949, the French Native Affairs officer was present in Bzu only the weekly market day.

The strongest indication of a shift in popular sentiment toward the monarchy during the 1940s was the widespread replacement of the title "sultan" with the more "modern" usage of "king" (malik), a usage that first gained currency among the educated in the 1930s. For the French, the ruler of Morocco was the sultan, and his entity of rule was the Sharifian Empire, concepts that nationalists regarded as archaic. "King," in contrast, delineated the ruler of a specifically delimited territory. For the French, use of the title "king" was evidence of nationalist agitation and therefore illegal.

Although the French sought to discourage travel by the monarch in the late 1940s, they allowed the leaders of complaisant religious orders to circulate freely, collecting gifts and donations from their remaining supporters. ‘Abd al-Hayy al-Kittani continued to travel throughout Morocco with the blessings of the French, as did Hajj ‘Abd as-Salam an-Nasiri, head of the the Nasiri religious order in Tamgrut. Hajj ‘Abd as-Salam last visited Bzu in a car surrounded by fifty splendidly dressed, armed retainers on horseback in 1949. ‘Abd ar-Rahman described his “progress” (harka) as being “like that of the sultan.” Such visits nonetheless ceased after 1949, as the safety of these religious leaders in their travels could no longer be assured because of their open support for the French.

When the king was allowed to travel, he was enthusiastically received. In April 1950 he visited Marrakesh. ‘Abd ar-Rahman’s diary records the visit. To get a glimpse of their ruler, crowds, including ‘Abd ar-Rahman, lined his intended route from early in the morning. At 10:20, Sidi Muhammad bin Yusif got out of his automobile in Jama’a al-Fna’, entered the madina and walked to the Yusufiya. Carpets were spread over the entire route. Although the walk was a short one and the monarch was not permitted by the French to make a speech or to pause at the Yusufiya, he returned to the motorcade only at 11:15. Along the route, spectators continuously chanted “Long Live the King!” and “Long Live the ‘Alawi dynasty!,” words that ordinarily led to arrest. ‘Abd ar-Rahman recorded: “Those lining the route cried out these slogans until the colonialists (al-musta’mirin) wanted to close their ears.” The king then proceeded to the pasha’s house in Ryad Zaytun for lunch, and in the evening met there with the men of learning of the Yusufiya.

As with any royal progress, there was competition among local notables to entertain the king and his entourage. One spinoff of the monarch’s visit was a separate visit to Bzu by several ranking members of his entourage, including Madani bin al-Husni of the Ministry of Justice, the historian Muhammad bin ‘Abbas al-Kabbaj, the ubiquitous poet Hasan al-Bu Na‘mani, and Mukhtar as-Susi. The member of the group who arranged the visit, Hasan bin Ahmad bin Mas’ud, was a close friend of Qadi Ahmad. He sent a letter in advance (dated April 23) from Marrakesh announcing their arrival time and specified the desired menu. For one dish he even provided the recipe, just in case the preparation of the Rabati speciality was unknown in rustic Bzu. The visit, of course, reaffirmed the prominence of the Mansuris.

The Mansuris were so firmly entrenched in the administrative apparatus of rural Morocco that they could occasionally get their way over the objections of local French authorities. In September 1950, local French authorities at first denied ‘Abd ar-Rahman permission to go on the pilgrimage, a key event for which he had been planning for years. For the French, participation in the pilgrimage was a potential danger. It usually entailed visits en route to Arab countries antagonistic to colonial rule. Withholding permission was also a stick to be used against lukewarm local officials. For ‘Abd ar-Rahman, it was interference with one of his most important obligations as a Muslim. In undertaking the pilgrimage, a Muslim undertakes formally to commit the rest of his life to God. Almost the only decorations in ‘Abd ar-Rahman’s house, in addition to portraits of Morocco’s present king and Sidi Muhammad bin Yusif, is one of ‘Abd ar-Rahman himself, taken upon his return from Mekka, together with the

prayer-mat he used there and other souvenirs. The pilgrimage had profound meaning to him.

To secure permission to undertake it, he used the complex lines of communication available to established notables to bypass the local French hierarchy. The contact that eventually worked was established through an influential notary in Marrakesh of Bzu origin, who maintained amicable relations with the French and the Glawi, although he had clandestinely cast his lot with the king and the Istiqlal party.[50] Another channel was through his wife's family, distant relations of Hajj Thami al-Glawi. Finally the pasha's son, Ibrahim al-Glawi, wrote a letter on 'Abd ar-Rahman's behalf to Philippe Boniface, commandant of the Casablanca region, who authorized 'Abd ar-Rahman to leave for the pilgrimage in September. By that time, however, 'Abd ar-Rahman decided not to go. Participation in the pilgrimage in 1950 would have been construed by most Moroccans as a sign of collaboration with the French. Only after Independence, in i960, did he actually leave for Mecca, returning by way of Spain in order to visit the former Islamic capitals of Granada and Cordoba. This was the only occasion on which he ever left Morocco.

The Mansuri brothers, like most other men of learning, followed the cautious political lead of Sidi Muhammad bin Yusif. The monarch carefully avoided direct confrontation with French authorities, but at the same time lent tacit support to nationalist leaders. Relations with the French and their Moroccan allies became increasingly bitter. Finally, there was a face-to-face confrontation between Hajj Thami al-Glawi and the king, in which the pasha of Marrakesh informed the monarch that he was the sultan of the Istiqlal party and not of Morocco (Julien 1972.: 32.4). When the encounter was first publicly reported, Mukhtar as-Susi was a guest of the Man-suris in Bzu.

When [Mukhtar as-Susi] first heard the news on the radio, he said nothing. Later in the day, he asked Qadi Ahmad to accompany him on a long walk. He told the qadi that he would have to leave the next day. My brother protested that he had just arrived, but he insisted he must leave to put his affairs in order. Indeed, soon afterward he was arrested by the French.

*** The Deposition

To justify their increasing pressure against the king, the French encouraged Hajj Thami al-Glawi to circulate a petition denouncing Sidi Muhammad bin Yusif for, among other matters, his disregard of Islamic values. 'Abd ar-Rahman claimed that even Hajj Thami al-Glawi was against the wording of the petition and "raised his hand" against it, although in the end he yielded to the French. When the petition was circulated, notables were told that it was against communism. Most would not have signed if they knew its actual content. The qaids of the southern regions of Morocco, for the most part poorly educated or illiterate, readily signed. Most men of learning, including the Mansuri brothers, refused to do so despite intimidation and threats.

The French deposed the monarch on August 20, 1953, exiling him and his immediate family to Madagascar. He was replaced by a reluctant and ineffectual distant relative, Muhammad bin ‘Arafa. It became increasingly difficult to remain uncommitted in the struggle against the French. After the monarch’s deposition, ostensibly carried out at the request of Moroccan notables, men of learning were expected to offer an oath of fealty (bay‘a) to the “puppet” sultan. Most refused to do so. The attitude of most was that withholding consent was in itself a sufficient political statement. Both the French and their Moroccan supporters such as Hajj Thami al-Glawi freely used threats and intimidation to secure compliance to their will.

The day after the exile of Sidi Muhammad bin Yusif was the Feast of Abraham (‘Id al-Kabir) in Morocco, a day on which the entire community of men assemble for collective prayers at the prayer-ground (msalla) adjoining every Moroccan town. As a prelude to the sermon delivered on such occasions, each prayer-leader customarily recites an oath of fealty to the reigning sultan. At the time, ‘Abd ar-Rahman was imam for Bzu.

That day, when I went to the prayer-ground to say the sermon, I left the keys to the house with my wife. I had never done that before. I said to her: “I don’t know what will happen. I don’t know if I will return. Take the keys and look after the children. When I got to the msalla, I saw members of the Foreign Legion on a ridge overlooking the assembly, with machine guns trained on us. By the time the sermon was over, everyone was in tears.

I asked ‘Abd ar-Rahman in whose name he said the sermon.

I got to “in the name of the sultan,” then I coughed. I didn’t pronounce the sermon in the name of any sultan.

But you could have, I persisted.

Yes, but to have said it in the name of Muhammad bin Yusif would have been sedition to the French. To have said it in the name of Muhammad bin ‘Arafa would have been a lie. It would have been against the shra‘. So I said nothing clearly. And everyone went away weeping. The French were very afraid that night. Before morning, sixteen people were arrested in Bzu.

A declaration in the name of the deposed sultan would have been a futile gesture, and therefore an “unreasonable” one. French troops were present and there was no way in which the immediate return of the deposed king could have been realized. Nonetheless, ‘Abd ar-

Rahman was unwilling to compromise his Islamic principles and declare an oath of fealty to an illegitimate ruler.

The Mansuri brothers did nothing to affirm the legitimacy of Muhammad bin ‘Arafa, but neither did they overtly work for his fall. In a term of self-description current among many men of learning of the period, they were neutre, a term that entered colloquial Moroccan Arabic after 1953 and that carried a very special contextual meaning. As in prior times of political crisis in Morocco (Burke 1972; 1976), men of learning were reluctant to enter the political arena, but being “neutral” was in itself a political act that increasingly paralyzed the French administrative apparatus. They remained overtly aloof from the nationalists, but withheld support from the French. They knew who the local nationalists were and who participated in the terrorist bands that became increasingly active after the monarch’s exile. Support for Muhammad bin Yusif indirectly united nationalists and “neutrals.”

To the French, Moroccans could assert that their neutrality implied nothing more than political noninvolvement, precisely the sort of attitude colonial officials encouraged all along. Virtually all work in the Islamic law courts and the “traditional” law courts in Berber regions ceased. Court officials declined to recognize the legitimacy of the ruler in whose name they were expected to act. They appeared at their places of employment, but performed no work.

In their own way, men of learning were just as effective in paralyzing the work of the protectorate as were nationalist merchants in paralyzing food distribution systems and militant dockworkers in controlling the Casablanca port. An open declaration in support of the exiled sultan brought swift punishment and immediate removal from office. Being “neutral” tied up the French in their own style of feint and required time-consuming actions against individual officials. Moreover, the information the French needed to proceed against individuals ultimately had to come from Moroccans themselves. Even the pasha of Marrakesh, to whom the French provided an unrestrained hand in suppressing opponents to their policies, were held back from decisive action by the complex, interlocking ties among notables. No one was certain of the outcome of events, so that most Moroccans temporized rather than openly take sides. At the same time, the rhythm of strikes, sabotage, and open violence dramatically increased (Le Tourneau 1962: 233, 238–244).

As in earlier periods under French colonial rule, ties of kinship and friendship with officials elsewhere in Morocco kept the Mansuri brothers informed of hostile moves against them. By 1954 the French began to remove from office Moroccans suspected of supporting the deposed monarch. Many officials and notables were imprisoned and had their lands and other property confiscated. The local administrator in Bzu recommended prison for Qadi Ahmad and the confiscation of his properties. The recommendation was vetoed by his immediate superior in Azilal, Alexandre, an officer with decades of experience in the region. Alexandre appeared to be aware that the decision to depose the king had been maladroit and numbered the days of colonial Morocco. ‘Abd ar-Rahman narrated:

Alexandre summoned the qadi to Azilal. There he asked him whether it was true that he said to Hajj Thami al-Glawi that he still recognized only Muhammad bin Yusif as sultan. The qadi replied that he was a “friend of France” (a conventional phrase often used by the deposed monarch himself) but that the only sultan he recognized was Muhammad bin Yusif. Another French officer, also present, suggested that the only hope of the qadi to avoid exile and confiscation of his lands was to seek the pardon of ‘Abd al-Hayy al-Kittani.

Alexandre then asked the qadi to step outside, in order to speak with him in private. He proposed that the qadi accept a transfer to as-Swira for a few years. In time, he said, death by old age would overtake Muhammad bin ‘Arafa and Hajj Thami, and by then Muhammad bin Yusif might well return to the throne. Alexandre also told my brother that the Glawi was rapidly losing his ability to influence events. My brother listened to Alexandre and left for as-Swira.

“Why did Alexandre do this for your brother?”

Alexandre understood the situation like a French noble. He had worked earlier with Qadi Ahmad and spoke excellent Arabic. He argued with his superiors that if the Mansuris or their properties were touched because of the incident in the msalla or their refusal to recognize Muhammad bin ‘Arafa, it would be like lighting a fire under the earth that would build up and eventually lead to an explosion. Alexandre knew the reputation of our father, of how tribesmen paid the first taxes thinking they were alms. He feared an uprising.

So a French officer invoked his reading of local tradition with his superiors to head off a local confrontation with erstwhile Moroccan colleagues. In January 1954 Qadi Ahmad left for as-Swira, but by April was removed from his official functions there for unspecified “administrative reasons.” Nonetheless, he remained in as-Swira for two years and three months, until Morocco’s independence in March 1956. For the first time since becoming his brother’s deputy in 1932., ‘Abd ar-Rahman officially assumed the function of qadi in Bzu in January 1954, although he too was removed from his post in April. In November 1955, when Sidi Muhammad bin Yusif returned from exile, the two brothers sought an audience with him in Rabat. Qadi Ahmad was so overcome with emotion that he cried in their monarch’s presence, leaving his younger brother to speak for the two. ‘Abd ar-Rahman simply declared that the two of them were following the path set for them by their monarch (Sidna), and the king thanked them. The audience lasted five minutes.

*** Independence: The View from the Periphery

Many Moroccans enthusiastically anticipated the beginning of a new social and economic order in 1956. Yet by the 1970s, a leading Moroccan intellectual could write in retrospect that the post-1956 Moroccan government was not a “resumption of the precolonial past, but a continuation of the regime of the Protectorate” (Laroui 1974: 53; 1977a: 348). In the first few years after independence, it appeared as if rural notables, for the most part compromised with the protectorate, were to be shunted aside in favor of the urban bourgeosie, who formed the backbone of nationalist leadership, provided the cadres of the new administration, and supported most of the new government’s plans for industrialization and modernization, much of which were inherited from the last years of French rule. In 1958 a decree was passed that sequestered the property of “feudal and traiterous elements,” principally the rural elite, although it was never vigorously applied (Leveau 1977: 275).

In retrospect it is possible to discern, as does Laroui, a strong continuity between the protectorate and postcolonial regimes. For persons who lived through the often violent events of this period, no such continuity was apparent at the time. Yet almost without exception, the families of notables influential under the protectorate remained in place after independence. In the turbulent first years after independence, the monarchy came to realize that one of its principal pillars was the category of landed rural notables, who also constituted the bulwark of the former protectorate (Marais 1969; Leveau 1977). After a period of indecision, by i960 the monarchy decided to avoid measures that would alienate the support of rural notables (Leveau 1977: 273–278; Marais 1969; Gellner 1973).

On the one hand, the Mansuri brothers were denounced by their enemies during the protectorate as nationalist supporters, and their refusal to acquiesce in the deposition of Muhammad bin Yusif cost them their sinecures in the judiciary and threatened the confiscation of their lands. On the other hand, after independence, the nationalists accused them of collaboration. Such accusations caused temporary setbacks for rural notables in many regions of Morocco, but Qadi Ahmad’s ties with the Palace, and probably his reputation with liberal French administrators who remained at their posts to ease the transition to independence, insulated him from the excesses to which other rural notables were sometimes exposed.

The months before and after independence in March 1956 were a confused period. Immediately after independence, Qadi Ahmad was appointed simultaneously in two separate decrees as qaid and qadi of Ntifa, although after a month and seven days the qadiship was taken away from him, leaving him to continue reluctantly in his role as qaid. Because the judiciary in rural Morocco was in general not seriously compromised by their prior dealings with the French, many qadis found themselves the only available persons to work with the new Ministry of the Interior in rural areas.[51] Ahmad Mansuri submitted his resignation on February 28, 1957. It was finally accepted on June 17. As a sign of the continued esteem in which he was held by Muhammad bin Yusif, he was appointed to Morocco’s Constitutional Council in i960. Indicative of his local support, he was subsequently elected a delegate to Morocco’s first parliament in 1963, the last formal function he was to exercise prior to his death on March 6, 1975.

Qadi Ahmad’s appointment as qaid was made over the opposition of local activists in the Istiqlal party. In the first years after independence, the monarchy was still uncertain of its strength and, as ‘Abd ar-Rahman recalled, local leaders of the Istiqlal party installed themselves as necessary intermediaries to the administration. Urban militants of the party were frequently made administrators of rural areas, but their inexperience and unfamiliarity with the rural milieu handicapped effective administration. Prior to independence, a modest monthly subscription had bought membership in the Istiqlal party, but after independence, the cost of adhesion escalated considerably as persons who had stood on the sidelines sought to insure their future. Every application to the government for employment, use of forest lands, adjustment of taxes, went forward only with a recommendation by the local Istiqlal bureau.

As for ‘Abd ar-Rahman, his first appointment came nearly a year later. In independent Morocco, the greatest urgency was attached to insuring continuity in the Ministry of the Interior. Local appointments to the judiciary took somewhat longer. On May 6, 1957, while he was overseeing the use of a mechanical harvester on his fields, he was brought a message to return to Bzu immediately for a telephone call from the minister of justice, ‘Abd al-Krim bin Jallun, offering him the post of qadi of Boujad. Ele accepted. The official proclamation arrived nine days later.

For ‘Abd ar-Rahman’s generation, there is a close link between the structure and goals of religious orders and those of political parties (hizb) (cf. Rezette 1955: 2.7), an attitude not dispelled by his experiences of political interference with the Islamic judiciary in the first years of independence. “They fight with one another and deceive people to win their support. Like the brotherhoods, the political parties are primarily interested in pulling political power in their direction (fa-yjurru l-quwwat).” As a key example, he cited the practice of the Istiqlal party in the early 1950s of requiring adherents to swear an oath {qasni} on the Quran, a practice also used by some brotherhoods and taken very seriously. ‘Abd ar-Rahman considers such oaths to be bid‘a. Many early nationalist meetings were also held in mosques. Men now in their forties and fifties continue to vote for the Istiqlal party in Morocco, even though it is rapidly declining in popular support, because of the oath they swore years earlier.

When ‘Abd ar-Rahman arrived in Boujad as judge in 1957, the Istiqlal party was still more important than the local administration. It successfully “sponsored” all routine administrative requests and sought to intervene in the Islamic court, a move that ‘Abd ar-Rahman says he successfully opposed. The fragmentation of the Istiqlal party into various factions (ta’ifas) shortly after independence is interpreted by ‘Abd ar-Rahman as just another sign of the concern of political leaders with nothing but opportunities for themselves.

A second element to contend with in rural areas immediately after independence, especially in southern Morocco, was the self-proclaimed units of the Army of Liberation (jaysh at-

tahrir). In some regions efforts were made to incorporate these bands into the newly formed Moroccan army. Elsewhere the activities of independent units increased rather than diminished with independence, suggesting a hazy demarcation between brigandage and politically motivated terrorism. For ‘Abd ar-Rahman, participants in the Liberation Army were prone to anarchy (siba) because they failed to ascertain the wishes of the monarch, the source of legitimate Islamic authority. By failing to do so, they were in his judgment no better than the rioters in Marrakesh in 1956 who burned to death several of the Glawi’s most notorious collaborators (see Maxwell 1966: 266–268).

Liberation Army units were active in Bzu, especially after France announced its intention to grant independence to Morocco. ‘Abd ar-Rahman describes one incident:

A squad of them came to me one day [after independence] in Bzu. They were from the region, but not from Bzu itself. They all had rifles. I didn’t know them, but they knew my brother and myself. My brother was qaid in Azilal at the time. They knew his reputation as a tough man, so they spoke to me instead. They said they wanted our car, so that they could go on a mission to “visit” a traitor [name deleted], who was a qaid in the Protectorate. All those who worked for the Protectorate were being threatened.

“Who gave you the orders to kill him?” I asked. “Was it the sultan?”

They replied that they didn’t know the sultan. All they knew was ‘Allal [al-Fassi] and the [Istiqlal] party. Often they chose their own targets. They took our car and went that night to the qaid’s, but he put up a fight, killed one of them, and escaped. They killed the qaid’s son, though. For that they got five years in prison.

At first, the sultan said nothing. He watched these things happen. Once he knew where his power was, he began moving against [the Liberation Army]. They had become like the [political] parties, always looking for money. Later the sultan also moved to limit the power of the parties. People were becoming afraid of the Istiqlal party because if the Istiqlal said that someone was against them, the man might be dead not long after.

The idea that at least some political leaders might have been motivated by notions of social justice was difficult for ‘Abd ar-Rahman to comprehend. For him and like-minded men of learning, men’s responsibilities toward one another were those laid out in the Quran and in Islamic law. As understood by Hajj ‘Abd ar-Rahman, these responsibilities delineate individual ethics and ignore the presence of classes and social groups (cf. Kessler 1978: 210–213). ‘Abd ar-Rahman’s concern is principally with how to guide individual conduct by the higher principles of the word of God as known through the Quran, the traditions of the Prophet, and Islamic law. Such concepts explicitly restrain and control base self-interest, but do not easily lead to collective notions of social justice.

** Seven: The Great Transformation?

*** The Erosion of Traditional Learning

‘Abd ar-Rahman became qadi in a world substantially different from that for which he had been educated. By 1957, higher religious learning was an empty shell of its former self. Men of learning retained widespread popular respect but their numbers were no longer being reproduced. Yet men of learning voiced no sense of crisis. No major efforts were made to sustain religious education in its older form.

When alternatives to the mosque-university developed on a wide scale in the 1930s, higher Islamic education quickly lost its former vitality. Its sudden decline can be attributed to a relatively straightforward conjunction of events. First was the French “organization” of Morocco’s two principal mosque-universities, the Qarawiyin in 1931 and the Yusufiya in 1939, undertaken ostensibly to improve the standard of learning. These “reforms” came in the wake of major protests against French rule in which the mosque-universities had played a role (al-Fassi 1954: 128–129, ¹33-¹3S’)- French “organization” made the faculty salaried civil servants subject to governmental control. Those teachers remaining in the organized institutions suffered a significant loss of popular prestige. Gifts to them by pious Moroccans, rich and poor, virtually ceased. Rather than teach in the “organized” milieu of the Qarawiyin after 1931, several of its leading teachers left for elsewhere in the country, including the Yusufiya and mosques in smaller towns. A similar exodus occurred from the Yusufiya when organization was imposed upon it in November 1939.

The procedure used by the French to appoint mosque-university leadership was identical to that used for the appointment of local officials. Protectorate authorities proposed three candidates to the sultan, leaving him the final choice. In the shell game of the protectorate, the French still reserved the right to veto the sultan’s selection.[52] The Yusufiya was given a rector and a Scholarly Council (al-Majlis al-‘Ilmi), composed of leading teachers at the Yusufiya.

The work of the rector and the Scholarly Council was monitored by a controller (muraqib) empowered to veto decisions reached by the scholarly council. The appointment of controller did not require the sultan’s approval and thus served as a useful check upon possible actions by the Council. From the “organization” of the Yusufiya until August 1953, the controller was Muhammad Burghba, known to have been working for French intelligence. After Muhammad bin Yusif’s deposition, he was appointed Minister of Pious Endowments under the “puppet” sultan, Bu ‘Arafa. Burghba was subsequently killed during the April 195 6 riots, a month after independence, in Marrakesh

(Maxwell 1966: 266–2.68). Burgh-ba's replacement as controller for the last two years of colonial rule was 'Abd al-Wahhab as-Sahrawi ad-Dukkali.

The four successive rectors under French rule were respected scholars. The first was Mulay Mubarik al-Amranl, originally a learned shaykh of a religious lodge in Tafilalt, in southern Morocco. In January 1941 al-Amrani left for the Qarawiyin and was replaced by Muhammad ibn 'Uthman, a reformist who had studied for eight years at the al-Azhar in Cairo and wrote a book on the Yusufiya's early history ('Uthman 1935). Former students remember him with affection because he distributed his entire salary among needy students. He was replaced after his death in March 1944 by 'Abd al-Qadir bin 'All al-Misfiwi, a man of learning whose father was a minister in the prior century under Sidi Hasan bin Muhammad. He was removed in August 1953 for protesting the king's deposition, and replaced briefly by Muhammad bin Hashmi al-Misfiwi. After August 1953, the Scholarly Council continued only as a fiction. Upon his return to Morocco in November 1955, Sidi Muhammad bin Yusif dismissed both the rector and the controller.

French "organization" of the mosque-universities played a role in undermining the organizational basis of higher Islamic learning, but a more significant factor was the increasing availability beginning in the 1930s of government schools run by the French, which siphoned off the children of Morocco's elite. In a context analogous to what Colonna (1975) has described for Algeria, Islamic institutions became the least attractive option open to Moroccan Muslims in colonial society. Moreover, significant numbers of Moroccan graduates from French schools began by the 1930s to fill posts in the colonial bureaucracy and to play other key roles in colonial society that remained open to Muslims. Studies in a mosque-university ceased to be an effective means of social advancement.

The consequence was to leave the mosque-universities primarily to poor students of rural origin. Contemporary estimates of the number of students of rural and urban origin at the Qarawiyin indicate the significance of these changes. In 192.4, 300 students were from Fez itself, whereas 419 were from outlying and predominantly rural regions (Marty 1924: 337). By 1938, only 100 students were from Fez and 800 were of rural origin (Berque 1938: 197). Although exact figures are unavailable for Marrakesh, consultants estimate that there were roughly 400 students at the Yusufiya in the early 1930s, of whom about 150 were from Marrakesh itself. The number of urban students had dropped to a handful by 1935, and almost none were from prominent rural or urban families. Islamic education had begun to be regarded with disdain even by those who took part in it during earlier periods because of the lack of "analysis and synthesis" in its style and content (Berque 1974: 173–179). Such a criticism implicitly compared the style and content of Islamic education with that at least ideally available in schools provided by the French.

In the first decade after colonial rule was established, concerned Moroccan bourgeoisie sought to meet the challenge of French-controlled education through the creation of "Free Schools" that were independent of French control but that adopted some European subjects

and pedagogical methods to provide an alternative education, primarily in Arabic. These schools reached their maximum enrollments of 1,500–2,000 students in the mid-19 20s, a significant figure since total Moroccan Muslim enrollment in French schools was about 6,000 in the same period, after which enrollments steadily declined (Damis 1973: 16). As important as such schools were as an ideological expression on the part of those who backed them, their long-term educational impact was minimal. Moroccan notables saw their children's futures and their own increasingly tied to the training and certification that only French schools could provide.

The more interesting, and difficult, question is why this collapse had no direct impact upon the basic popular and learned paradigm of valued knowledge as fixed and memorizable, especially since at least in principle the social reproduction of such knowledge was necessary to make available the word of God for the guidance of the Islamic community. Why did the effective collapse not result in any major concerted action, or reaction, on the part of men of learning? This issue directly involves the relation of knowledge to society in the Moroccan context and the way in which value is placed on various bodies of knowledge and its carriers.

Traditionally educated Moroccan intellectuals were acutely aware of the major transformations that their society was experiencing as a consequence of colonial rule. In practical terms, the principal response of reformist intellectuals to this perceived crisis was merely to seek to persuade those who already possessed an understanding of the religious sciences to accept the "new orthodoxy" which they advocated. Yet many of these same individuals sent their sons and daughters, as did 'Abd ar-Rahman, to French-run schools rather than to mosque-universities or even the independent "Free Schools."

A partial explanation for the inaction of men of learning is that colonial rule posed no direct threat to their material interests. As with their nineteenth-century counterparts in British India (Metcalf 1982: 87–88), Morocco's men of learning realistically concluded that there was little effective resistance they could make against foreign rule, so sought instead to maintain their religious integrity. From the inception of the protectorate the French sought to engage the support of this elite by assimilating them into their system of indirect rule, a system that functioned with a high measure of success in the first two decades of colonial rule, especially under Lyautey (Rivet 1980). Unlike neighboring Algeria, where the influence of the traditional elite was systematically destroyed, the Moroccan traditional elite were given administrative and political preferment and their children were given access to French education. Despite radical political and economic transformations, the elite managed in general to confer their status upon their descendants (Leveau 1977; Waterbury 1970; cf. Bourdieu and Passeron 1977).

Taken by itself, an explanation based on material interests is insufficient. It does not account for the continued popular respect enjoyed by men of learning. In rural Morocco, religious intellectuals today are profoundly respected for the knowledge they possess even when as a

body they did not actively participate in the nationalist and anticolonial movements. In Morocco's 1963 parliamentary elections, they constituted 130, or 57.4 percent, of the 223 candidates, and 27, or 55.2 percent, of the 49 actually elected (Leveau 1976: 188189). A few traditionally educated intellectuals from prominent urban families, including 'Allal al-Fassi (see al-Fassi 1954; Rezette 1955; Waterbury 1970: 44) bridged the world of traditional learning and that of "liberal," European-style politics, but such transitions were exceptional. Most "ordinary" exemplars of mosque-university education regarded direct engagement in organized political activity as suspect and alien. Although their mistrust of political parties and plans for economic development have been characterized as based upon "a certain confused ideal of social justice" (Leveau 1976: 93), they enjoy extensive support among peasants and tribesmen, small landholders and shopkeepers.

The ideal of social justice held by traditional men of learning is "confused" only when analysts consider it in Western categories. Two implicit premises of the world view of traditionally educated Moroccan intellectuals have already been indicated—the notion of inequality as a natural fact of the social order and a highly restricted sense of social responsibility. These premises are perhaps most effectively delineated through comparison with two contrasting traditions of "gentlemanly" education, English and Chinese, which also possessed implicit notions of social inequality. Students of public schools in Victorian England were instilled with a sense of equity or "fair play," leadership, and public spirit which had its analogues in political life, whereas in China men of learning were considered to possess exemplary moral virtues that suited them for positions of authority (Wilkinson 1964; Weber 1958). There was no expectation in Morocco that Islamic men of learning should constitute an ideological vanguard, even in times of major social upheaval. They could on occasion serve as iconic expressions of popular sentiment, but there was no developed tradition in which they were able to shape these sentiments or guide the direction of social change.

The affinity between popular conceptions of valued knowledge and those conveyed in Islamic education explain the continuing popular legitimacy of such forms of knowledge and, at least in principle, of its carriers. What of the limitations of form of Islamic knowledge and its associated intellectual technology? The notion that the most valued knowledge was fixed by memorization in the first place limited the number of texts that any individual could "possess" thoroughly, just as did the notion that valued knowledge was accessible to all men of learning. A range of new materials could be introduced, but there was no value placed upon specialization in a given field of knowledge within this tradition of learning. The consequence was that innovations of content tended to suffer the same fate as innovations in societies without developed traditions of writing. Men of influence in the milieus of learning could to a limited extent introduce new materials, but innovations suggested by others had little chance of taking hold. Nor could specialized forms of knowledge proliferate, even the valued attempts to introduce mathematics and military technology in the nineteenth century (al-Manuni 1973). The body of valued knowledge shared by men of learning of any generation shifted over time, but it did not become more elaborate in form. There was no room in this tradition for disciplinary competences to be carved out and elaborated by smaller, specialized communities of men of learning. Moreover, since knowledge was considered to be fixed and memorizable, the central ideological problem was

that of justifying any change of form or content in terms of its essential replication of past forms, instead of allowing an elaboration of form and content at least partially autonomous from generally accepted forms.

In the past, the memorizable truths of Islamic education were passed from generation to generation. With the collapse of Islamic education in the 1930s, this is no longer the case. To the present, this demise of the technology of intellectual reproduction has had no pronounced impact; as elsewhere, major changes in educational systems take a long time to have a widespread impact. The concept of knowledge as fixed and memorizable truths is still concretely demonstrated in Moroccan society by men who have memorized the Quran and its proper recitation, and associated texts are still mnemonically carried by the last generation of traditionally educated men of learning. Yet the number of individuals who are able to demonstrate “possession” of such knowledge is rapidly diminishing. One consequence is that the older generation of men of learning consider their younger replacements as essentially ignorant, knowing little of Islamic law beyond the bilingual French and Arabic handbooks prepared by the Ministry of Justice. The accuracy of this appraisal is not at issue here, but implied in it is the notion that their replacements are little more than bureaucratically appointed specialists who carry neither the authority nor the sense of legitimacy that they regard themselves as having possessed in the past. This notion appears largely to be popularly shared.

The shift of religious knowledge from that which is mnemonically possessed to material that can only be consulted in books suggests a major transformation in the nature of knowledge and its carriers. It may still be ideologically maintained that religious knowledge is memorizable and immutable, as is certainly the case for the word of God as recorded in the Quran, but the lack of concrete embodiment of this premise in the carriers of such knowledge indicates a major shift. This shift may not be consciously recognized, just as many Muslim intellectuals claim that the French colonial experience had little impact on the belief and practice of Islam, which from a sociological point of view is decidedly not the case (Eickelman 1974).

One consequence of this shift is that socially recognized carriers of religious learning are no longer confined to those who have studied accepted texts in circumstances equivalent to those of the mosque-universities, with their bias toward favoring members of the elite. Those who can interpret what Islam “really” is can now be of more variable social status than was the case when mnemonics were an essential element in the legitimacy of knowledge. The carriers of religious knowledge will increasingly be anyone who can claim a strong Islamic commitment, as is the case among many of the educated urban youth. Freed from mnemonic domination, religious knowledge can be delineated and interpreted in a more abstract and flexible fashion. A long apprenticeship under an established man of learning is no longer a necessary prerequisite to legitimizing one’s own religious knowledge. Printed and mimeographed tracts and the clandestine dissemination of “lessons” on cassettes have begun to replace the mosque as the center for disseminating visions of Islam that challenge those offered by the state.

*** From Mosque-University to Religious Institute

After Morocco’s independence in 1956, the French were in some ways able to play a larger role in formulating Morocco’s educational policies than they could in the protectorate. In 1955, only 25,000 new students entered the primary cycle. In the fall of 1956, 130,000 new students were enrolled (Dichter 1976: 127). Between 1912 and 1954, only 530 Moroccan Muslims passed both sections of the baccalaureat examination; in 1957, 13,374 baccalaureate degrees were awarded (Lacouture and Lacouture 1958: 248; Waterbury 1970: 84). The French widened educational opportunities after 1945, but mass education began only after independence.

Under French rule, education continued to be elitist, as it was in practice at the Qarawiyin and the Yusufiya. Educational standards were high, as they remained for the first few years after independence. Even holders of primary school certificates attained positions of responsibility. But because of its commitment to mass education, independent Morocco’s educational budget was overextended from the start. In the late 1950s, local communities enthusiastically contributed money and labor to supplement government efforts (Dichter 1976: 127). Once it became evident that the linkage between socioeconomic opportunity and educational attainment had become weakened, however, popular enthusiasm for modern education precipitously declined. As one traditional scholar commented, the long-term consequence of French and independent Moroccan educational policy was to destroy traditional education—today officially called “original” education—without replacing it with a strong, workable “modern” system?

Islamic higher education, although neglected in the years immediately after independence, never entirely disappeared. Since the late 1960s, it has received renewed official attention as the government recognizes the advantages of retaining control over it. To accommodate the traditionally educated, the government took over and in some cases established religious institutes (ma‘ahid al-Islamiya) at the secondary and postsecondary levels. Thus in 1938, religious education in Spanish Morocco was organized by the colonial government to include several provincial religious institutes (ma‘dhid ad-dtniya), and after 1944 an Institute for Higher Religious Studies (Instituto Superior Religioso) in Tetouan (Valderrama 1956: 342–366). After independence, the Tetouan Institute was officially integrated into Morocco’s national university system as the Faculty of Islamic Theology of the Qarawiyin University. Also integrated into the Qarawiyin were the Institute of Islamic Studies (now Dar al-Hadith al-Hasaniya) in Rabat, responsible for the training of contemporary Islamic scholars. What remains of the Yusufiya is now officially called the Faculty of Arabic Language and Literature of the Qarawiyin in Marrakesh, with nineteen formally recognized faculty as of 1976 and 236 “undergraduates,” of whom twenty-two are women (afme 1976: 2). Other institutes, including Taroudant and Tamgrut (established in the precincts of the old religious lodge in 1982), operate roughly at a postprimary educational level.

Instruction is exclusively in Arabic (except for the Qarawiyin in Fez, where French is officially available as a foreign language). Most graduates end up teaching in government-sponsored Quranic schools. Unlike the Qarawiyin, where many teachers are currently drawn from other Arab countries because of earlier gaps in the training of religious scholars in Morocco, the faculty in Marrakesh are primarily Moroccan.

The last rector of the Yusufiya, appointed shortly after independence, was Rahhal al-Farruqi, who is now dean of the Faculty of Arabic Language and Literature in Marrakesh. Originally from Awlad Hammu of the Ahl Ghaba tribe of the Sraghna plain, he was born into a lineage that consolidated its local authority during the protectorate. His father hired a talib to supervise his studies, and the talib even accompanied his protege to the Qarawiyin in the 1930s. Today he is head of Morocco's League of Ulama (ar-Rabita al-'ularna), and is considered to be Morocco's foremost grammarian and traditional orator. His lectures are televised every Ramadan, with the king among those in attendance.

As disenchantment with modern education grew more widespread in the 1960s, the government sought to expand the role of "original" education. In 1968, the government mandated a year of Quranic schooling prior to admission to the primary school cycle. This move temporarily lessened pressure on public schools, which can accommodate only roughly half of all eligible students. It also reaffirmed government respect for original education and provided additional sinecures for the traditionally educated. Original education thus regained a modicum of respectability. But the "new" system of original education is not a straightforward resurrection of the old. To the extent that memorization still occurs, it is on the basis of mass production to a standard curriculum, complete with examinations, as opposed to the style of earlier institutions. It also systematically introduces students to the reading and writing of secular texts, something that traditional Quranic schools did not do.

*** Personal Choices

When I asked 'Abd ar-Rahman why he did not encourage his own children to pursue religious studies, he responded quite simply that "times change" (tbaddal al-waqt). The circumstances ordained by God for the community of believers today are different from those in the past. The theme of the presentday world as defective, deteriorating, and corrupt, often casually invoked by 'Abd ar-Rahman, is not unique to his generation. It is characteristic of writings of Moroccan historians from at least the sixteenth century to the present (Levi-Provencal 192.2). A consequence of this stylized characterization of social reality is to accept as given the impermanence and provisionality of all human affairs. It discourages metaphysical reflection on how things might have been, reflections that would challenge what God had actually ordained, or how things ought to be. It encourages instead attention to perceiving the exact present state of social and political affairs (Eickelman 1976: 126–130; see also Waterbury 1972: 156–158).

All of ‘Abd ar-Rahman’s seven children received education in government schools. The eldest son was born in the early 1940s; the youngest in the mid-1960s. His eldest son entered primary school under the French and received a secondary degree after independence. In a pattern common with many Moroccans who completed secondary studies in the 1960s, he joined the administration rather than continue directly to higher studies, although his ministry subsequently sent him to France for advanced specialized training. ‘Abd ar-Rahman’s eldest daughter received a primary education in the late 1950s and early 1960s but, again in common with women of the period in smaller towns, where higher education was locally unavailable, she did not continue at the time. The qadi’s younger daughter, who began primary studies in the late 1960s, is presently engaged in secondary studies. The other sons all studied through the secondary level. One is a senior manager for an investment firm in Casablanca; another is an intermediate schoolteacher in Boujad and has been a member of the town’s municipal council. A younger son was selected for the Palace school as a classmate for the crown prince.

*** Challenges

Changes in basic patterns of thought and religiosity are often evident only in retrospect. As the late Raymond Aron (1970: 245) wrote, the main task of sociological explanation is “to render social or historical content more intelligible than it was in the experience of those who lived it.” The implication of major changes in political and economic forms and in the intellectual technology of how ideas get reproduced and disseminated are just beginning to be explored, in the context of Islamic and Middle Eastern studies.

One such “great transformation” is the introduction of literacy upon historically known and contemporary societies. Most of Jack Goody’s The Domestication of the Savage Mind (1977} is concerned with the introduction of literacy in nonliterate societies. His discussion of the more nuanced problem of the shift from restricted to generalized literacy, from literacy possessed by a minority specialist elite to that accessible to wider elements of the population, occupies only the last ten pages of his book (1977: 152–162; see also Waldman 1985).

§erif Mardin (1982a; 1982b) suggests the consequences of changes in styles of literacy and changes in the intellectual technology through which ideas are transmitted upon forms of religious knowledge and organization in his studies on the Turkish fundamentalist Said Nursi (1873–1960), the Bediiizzaman (“Nonpareil of the Times”) and founder of the Nur (“Light”) movement. Through the nineteenth century, the accepted popular and elite notion was that religious knowledge and insight were acquired only with the guidance of a reputed master. In

the Nur movement the “message” of the founder— his opinions on religious subjects and his commentaries on the Quran (written in Turkish, in itself a major innovation)— were more important than his person or personal ties to him. This aspect of the Nur movement was remarkably different from the practices of other Sufi orders. The form of Said Nursi’s message was thus characterized by “the written text replacing the instructions of the charismatic leader and the attempt to make the central truths of the Koran intelligible to a wide audience” (Mardin 1982b: 19).

This style of religiosity was made possible by what Mardin terms the “communications revolution” that began to be felt in Turkey by the late nineteenth century. Patterns of governmental organization and authority changed substantially, as well as the forms in which knowledge and information were construed and communicated. Even when persons in authority thought they were using new technologies to preserve the old, new forms of thought and authority were shaped by the telegraph, newspapers, magazines, and an expanded (even if not mass) educational system. Newspapers and magazines, for instance, “replaced expostulation [with] arguments which were addressed to the presumed shared rationality of the readers” (Mardin 1982b: 13). The Nur movement spread with particular rapidity among the intelligentsia of Turkey’s provincial centers: schoolteachers, functionaries, and others who were linked at least indirectly with the new communicative styles and who constituted the principal audience for the proliferation of newspapers and pamphlets.

An equivalent incipient “great transformation” of religiosity in Morocco may be the recent proliferation of loosely organized associations of Islamic militants who characterize themselves as “neo-Salafis,” perhaps unaware that the same term was used by many men of learning in the 1930s, or even “the Muslims” (al-islamiyiin), in recognition of their self-proclaimed role of being the true carriers of Islam (Etienne and Tozy 1979: 2.45). The latter term also has a prior usage, known to professional historians in Morocco: in the late nineteenth century it referred to Jews who had converted to Islam.

The growth of these informal associations of young militants is linked to disenchantment with the results of over two decades of independence and an awareness of similar movements elsewhere in the Middle East. Interviews with participants in these groups, composed of students, schoolteachers, shopkeepers, and craftsmen, especially those living in the “popular” quarters of large towns in which recent rural emigrants predominate, suggest that they share a strong consciousness of social inequality, and a belief that the government will do little to ameliorate their situation. In their judgment, the government’s objective is primarily to increase the wealth of the present political elite (Etienne and Tozy 1979: 251). Etienne and Tozy hypothesize that the growth of these associations is a “compensatory phenomenon.” Independence in their view did not substantially improve the conditions of life in Morocco, so participants in the militant Islamic groups turn to renewed Islamic faith to avert “despair.” For them, the dynamism associated in the past with independence is now associated with Islam.

The growth of Islamic militancy in Morocco is more than the displacement of unrealized hopes associated with independence. A stronger case can be made for interpreting the proliferation of these groups in the context of long-term changes in styles of religiosity more akin to those suggested by Goody and Mardin. Organizationally, the neo-Salafi groups bear superficial resemblance to the student groups prevalent during ‘Abd ar-Rahman’s years at the Yusufiya. Their formal organization is minimal, so that not all groups even have distinctive names. They seek to disseminate their ideas through discussions at accommodating mosques and in secondary schools. As with roughly analogous groups in Egypt, recruits are mainly educated youth of small town or village origin, politically aware and currently living in communities experiencing rapid urbanization (Ansari 1984: 132134; Ibrahim 1980: 438). Proselytism is mainly through discreet personal contact. Unlike the religious groups of ‘Abd ar-Rahman’s generation or the early political groups of the 193os, their supporters are not primarily culled from the sons (and, today, daughters) of the elite. They attract persons with some education who are unaffiliated to political parties, and their goal is to create a distinctly Islamic public opinion (Etienne and Tozy 1979: 248). Some receive modest financial support from fundamentalist groups elsewhere, notably Saudi Arabia, Pakistan, and Iraq. All deprecate the traditional religious orders as possessing a weak intellectual level, an argument that would appear to have been won long ago, at least among the educated. A more contemporary concern is their view of the “official” men of learning, those honored by the state, as “bought” men who have too readily acquiesced to the wishes of the monarch. Some attribute the monarchy with weakening the influence of the men of learning of the mosqueuniversities (evidently forgetting the role of the French), compelling them to endorse such non-Islamic practices as the clause in the Moroccan constitution that declares that succession to the monarchy is henceforth to be by male primogeniture (Hassan II 1978: 2.2.8). Some also interpret the appointment of a Syrian to head the Dar al-Hadith al-Hassaniya in Rabat as indicative of governmental efforts to circumscribe the role of Morocco’s men of learning.

Another distinction by which Islamic militants distance themselves from the men of learning of ‘Abd ar-Rahman’s generation is their linkage between personal immorality, which is also roundly condemned by the older ‘ulama, and the nature of the economic and political system, which is not (Yasin 1979). Some militants say that they are “preparing” for political action (Etienne and Tozy 1979: 2.55), an interesting phrase that presumably shielded them until recently from government interference. Yet the attitude of the state toward these groups has rapidly changed. It is significant that in the 1981 riots in Casablanca, no claims were made that Islamic militants played a major part. Perhaps because the monarchy itself relies upon religious legitimation, it has acted with caution in curbing these groups. At the time of Etienne and Tozy’s study, their activities were monitored but not proscribed. That situation has now changed. After the January 1984 riots in Morocco, coinciding with the Islamic summit conference held in Casablanca, seventy-one arrests of Islamic militants were made. They were charged with incitement to rebellion and threats to internal security. Some of those charged allegedly possessed photographs of key officials, in order to identify them for kidnaping or assassination (Mekki 1984). The evidence presented by the prosecution failed to convince outside observers at the trial. The handling of the case and the severity of the sentences imposed, including thirteen death sentences, indicates the severity with which the government views the challenge posed by Islamic militants.

One of the most important new elements in Islamic militancy in Morocco is a sharp break with the past tradition of reliance upon authoritative commentary from qualified men of learning. Militants assert implicitly that each Muslim can personally judge whether the state, the monarch, and the “official” men of learning act in accord with the precepts of Islam. This attitude is less a challenge to the monarchy than to the religious monopoly of “official” Islamic spokesmen (Etienne and Tozy 1979: 2.44, 259). The notion that Muslims can directly interpret their faith without reliance upon intermediaries represents a significant break with the past, one made feasible by greater access to an educational system freed from direct ties to official orthodoxy.

There is growing disenchantment with the monarchy, some of which has been openly expressed, if with caution. Nonetheless, the fragmented associations of Islamic militants have yet to widen their respective bases of support outside major urban centers. The religious attitudes represented by traditional men of learning sustain widespread support in large part because the carriers of competing attitudes, however perceptive they may be in their analysis of some of Morocco’s political, social, and economic problems, have not yet managed to find a resonance in popular understandings of the linkage between Islam and politics. Unlike Iran, where the religious establishment has had an organized financial base largely autonomous from government control, a tradition of opposition to secular authority, and a monarchy that never directly claimed religious legitimacy as one of its central tenets, the Moroccan monarch continues to be regarded by the “silent majority” in the countryside as “God’s deputy on earth” (khalifat Allah fi-l-’ard). Morocco’s religious “establishment” does not possess an organized financial base independent from political authority, so that even the possibility of independent oppositional action is seriously circumscribed. Nor is there the popular expectation that royal authority and religious authority are meant to be autonomous. The prevalent popular notion of the monarch as God’s deputy is rarely invoked among the educated, even supporters of the monarchy, but indicates the presumption of religious legitimacy with which any self-consciously Islamic or political opposition must contend.

Any society contains competing discourses, which are not internally consistent and are filled with tensions and ambiguities. In Morocco, these competing voices are unequally weighted. Activists in organized political groups and Islamic militants each seek a departure from the accepted status quo. As such they must consciously articulate and win acceptance for wide-ranging reorientations toward politics and society. In contrast, Morocco’s men of learning can draw upon the mainstream of existing implicit acceptance of what Karl Mannheim calls “enduring actuality as compared with the progressive desire for change,” a preference for “organic,” existing social units rather than “classes,” and above all an emphasis upon concreteness in its discussion of politics and society (Mannheim 1971: 172.). Advocates of change from the status quo must fully articulate their intentions in seeking to win support.

Men of learning, by accepting existing social and religious arrangements, can presume support without fully elaborating the ideological basis of their actions. Thomas S. Kuhn,

analyzing changing support for scientific paradigms, argues that scientists who have invested their training and entire productive careers in a certain way of doing things often resist or place little value on newer approaches. They are confident that “the older paradigm will ultimately solve all its problems, that nature can be shoved into the box the paradigm provides” (Kuhn 1962: 150). Applied to the Moroccan case, the analogy of Morocco’s traditional men of learning with Kuhn’s scientific communities is only partial. The scientific community as described by Kuhn is more closed and self-contained, while the strength, and limitation, of Morocco’s men of learning is the extent to which they articulate the views of a majority of the population, even if they are not the political activists. The conservative thought represented by Morocco’s men of learning survives in part because its supporters move in separate grooves from those civil servants, educated youth, and others caught in Morocco’s “modern” sector. Within these categories of Morocco’s population, popular support for a more traditional intellectual and religious style has waned. Competing styles of religious thought and action have begun to emerge. In Iran, the organization and ideology of the religious establishment remained autonomous in spite of vigorous efforts by the state to curb its influence prior to the revolution. Morocco’s traditional men of learning have had neither the independent base nor the organization to pose a political challenge. They continue to benefit from state patronage, but the state-sponsored centers of religious learning are not producing a new generation capable of exercising religious leadership of a scope comparable to that of an older, disappearing generation. The fact of competing voices of Islam, some of which claim to be more “authentic” than the others, is not in itself new to Morocco or to other parts of the Islamic world. At the pinnacle of Moroccan society, key traditional religious leaders continue to have royal patronage and access to state-controlled radio and television. Increasingly absent, however, are the complex local expressions of traditional learning and the persons to maintain it. Traditional learning and its carriers in the past stood outside the political arena. It is unlikely that its successors will continue to follow this particular aspect of tradition.

** Glossary

The second of two forms indicates the plural. Transcription is according to local usage unless otherwise indicated.

‘adl: Notary.

‘alim-, ‘ulamd: Religious scholar.

‘dmmi; ‘awam: Common; ordinary.

bakans: Emigrant worker; from French vacance.

baraka: Supernatural blessing; abundance.

bay’a: Oath of fealty.

bid‘a: Innovation.

da‘wa: Personal prayer.

dahir: Royal decree.

dawwdr: Rural local community.

dir-. Piedmont.

fahm-. Understanding.

fitna: Sedition.

fqih; fuqaha: An Islamic jurist; a Quranic teacher; a literate person (now archaic).

habus-, abbas: Pious endowment.

hafid: A major scholar; a person who has memorized the entire Quran. Literary usage, hdfiz.

hajj: The pilgrimage to Mecca; also an honorific title used by those who have made the pilgrimage.

haram: Forbidden; religiously impure.

hizb: One of the sixty divisions of the Quran for recitational purposes.

ijdza: Teaching license.

‘ilm; ‘uliim: Religious knowledge or scholarship.

imam-. Prayer leader; leader of the faithful.

jami‘a: Mosque-university; mosque.

jalldba: Tunic.

katib: Clerk or scribe.

khalifa: Deputy.

khdssa: elite, special.

khutba: Friday sermon.

latif: Collective prayer in time of distress.

madina: City; in North Africa this term often specifically designates the precolonial part of a city.

madrasa: Place of study; a school; hostel for religious students.

ma‘had-, ma‘ahid: Institute.

Makhzan: Moroccan government; lit. “strongbox.”

mdlik: King.

marabout: A person, living or dead, thought to have a special relation toward God which enables him or her to ask for God’s grace on behalf of clients and to communicate it to them. See also sdlih.

ma‘riif: Known; socially recognized.

mqaddam: Spokesman (used in a variety of contexts); minor government official.

msId: Quranic school.

nadir: Overseer. Literary usage, ndzir,

nds khdssa: Lit. “special” people; the elite.

nizam: Organization; order.

qadv, quda: A religious judge.

qaid: Tribal chief or leader appointed over a tribe or small town during the protectorate; now an official of the Ministry of the Interior responsible for a rural or urban administrative unit. Literary usage, qa’id.

qd’ida; qawd’id: “The way things are done.”

‘qal: Reason.

qasam: Oath.

qasida: A verse form.

qrib: “Close.”

rasm: Property title.

Salafi: Reformist Muslim.

sdlih: A pious or devout person; a saint; in some contexts, a marabout.

sdaq: Bridewealth.

shaykh: Religious teacher or head of a mystic order; government official.

shra‘: Islamic law (with definite article); straight path. Classical usage: shana.

shrif; sburfa: Patrilineal descendant of the Prophet Muhammad through his daughter, Fatima. Literary usage, sharif.

s’iba: Anarchy; dissidence.

sihr: Magic.

silka: A recitational quarter of the Quran (lit. “thread”).

sulh: Truce.

sulta: Authority.

tafsir: Quranic exegesis.

ta‘ifa: Group; sect; faction.

talib-, tulba: Religious student; scholar.

tarjama-, tardjim: Traditional biography or autobiography.
t’arqiba- The sacrifice of a bull or bulls to conclude or renew an oath of allegiance or to seek a truce.

tartib-. Rural tax on herds and crops established by the French in Morocco.

tashalhit-. One of the three major Berber languages spoken in Morocco.

‘ushilr: Islamic tithe.

zawiya: Religious lodge or residence of a prominent marabout.

ISBN 0–691—09415–2

[1] In 1914, an estimated 89 percent of Morocco’s total population was rural. As late as 1969, 68.5 percent were still so classified, although by the 1960s remittances from emigrant labor began to figure significantly in the rural economy (Noin 1970: 42). In 1980 an estimated 57 percent of Morocco’s population was rural (Escallier 1981: iz).

[2] For detailed examples of such reporting, see Eickelman (1976: zn-254).

[3] Personal communication, May 31, 1983.

[4] See Rosen (1980) for a formal analysis of Moroccan Islamic law courts.

[5] Le Monde, August 26, 1955, p. 3, and August 28–29, 1955, pp. 1–2.

[6] ‘Abd al-Hayy, the eldest son by this marriage, began his studies in Marrakesh in the early 1930s, not at the Yusufiya, but at the Darqawi zawiya under the reformist shaykh, Mukhtar as-Susi (1900–1963). In 1935 as-Susi was exiled to his native Sus and the zawiya closed. A year later, ‘Abd al-Hayy went to Fez, where, with the intervention of his father, who had excellent relations with the influential Shaykh ‘Abd al-Hayy al-Kittani, he managed to enter the Qarawiyin. In 1949 he obtained a diploma from the Qara-wiyin, then became a secretary in the Ministry of Justice in Rabat. After independence he was appointed successively as qadi in Damnat, as-Swira (1959), examining magistrate in Marrakesh (1962.) and finally Qadi for Personal Affairs and Property in 1974, a post he held until his death.

[7] See Eickelman (1976: 96–99) for an account of the variable ways in which social ties are elaborated and expressed in Morocco.

[8] For recitational purposes, the Quran is divided into sixty sections (hizbs) of approximately equal length.

[9] The Senegalese novelist Cheikh Hamidou Kane (1963: 3–38) provides the only account of which I am aware that manages to convey the mixture of pious respect for exact recitation of the word of God and affection for their students associated with the severity of Quranic teachers toward their students. In one of many tarjamas presented by as-Susi (1961: ix, 35), a father obliged his son constantly to accompany him and to hold his slate, on which were written the Quranic passages to be memorized, before him. If his attention wandered and he was within reach of his father’s stick he would be beaten. If he was further away his father threw small stones. In this fashion the student memorized the Quran in six different recitational forms.

[10] Maher (1974: 193–198) reports that divorces as a percentage of marriages in the Middle Atlas region which she studied in the 1960s was 52. percent in villages and 38 percent in towns. Roughly comparable figures are provided by Geertz, Geertz, and Rosen (1979: 386–391).

[11] The math taught was similar to our own conception of the subject. This specification is needed because there was another form of mathematics prevalent in traditional learning in the Marrakesh region, al-hisab al-himdri, in which all basic mathematical functions were performed, but in a manner more cumbersome than that taught in European schools. According to Muhammad Aafif (personal communication, 1984), it was still taught at zawiya Sidi Zwayn, about 30 kilometers west of Marrakesh, in the 1950s.

[12] Written by Abu ‘Abd Allah Sidi Muhammad ibn Da’ud as-Sanhaji (“Ibn Ajarrum”) (d. 726/1324).

[13] This is the contextual meaning of the term among contemporary Moroccan men of learning. Its meaning differs in other sociohistorical contexts. For instance, in psychological treatises of the ‘Abbasid period the term implies “the faculty of memory.” I am grateful to Roy Mottahedeh for pointing out this earlier usage.

[14] The only estimate of the number of these schools in any region is contained in a 1955 census conducted in Spanish Morocco: 3,392. for a population estimated at 917,000 (Valderrama 1956: map opposite p. 155; Noin 1970: 1, 33). This means that there was a Quranic school for every 279 persons. Since none of the schools was supported by the government, it is reasonable to assume a similar proportion of schools to the population in the 1920s and 1930s.

[15] A 1974 study found that the average number of years spent in Quranic school varied from close to two years in Marrakesh to a low of 0.33 years in small mountain villages in the Middle Atlas (Wagner and Lotfi 1980: 241). Most mosque schools today have taken on the role of preschools. Only in remote rural areas do some students continue to remain for the time required to memorize the entire Quran.

[16] Such notions have also hampered the study of education in the West. For colonial America, see Bailyn (1960).

[17] Like other technical terms, hafid is subject to contextual variation. For ‘Abd ar-Rahman and other educated Moroccans, the term is sparingly applied only to the most outstanding scholars of any generation. In popular usage, the term refers to anyone who has memorized the Quran.

[18] Until the late nineteenth century, students in rural regions also made collective visits to surrounding villages each year after harvest to collect donations of grain and animals. With these donations, students then camped together and feasted for a week or longer. This practice ceased with the disorders which accompanied increasing European penetration (Aubin 1906: 78–79; Michaux-Bellaire 1911: 437). The urban counterparts of these outings were the “Feasts of Students.”

[19] I have been unable to provide further identification for this plant, which ‘Abd ar-Rahman knows only by its name in tashalhit.

[20] The shaykh was Bu Shu’ayb ash-Shawf al-Bahluli, who was poor and in need of money. Ahmad’s purchase of key rights from him was an indirect way of contributing to his support.

[21] See Deverdun (1966:11, Pl. 36) for a floor plan.

[22] Muhammad Aafif (personal communication) cautions that this prevailing notion of the decline of pious endowments in the nineteenth century may soon change as the result of studies now underway at the Universite Muhammad V in Rabat. Until now, no systematic investigation has been undertaken of nineteenth-century source materials.

[23] In comparison, French secondary education for Moroccan Muslims accounted for 505 students in 1924–1925 and 1,618 students in 1930–1931 (French Protectorate 1931: 245).

[24] The Qarawiyin had 700 students in the early 1920s with roughly 40 lesson circles meeting regularly, given by 25 shaykhs (Marty 1924: 345).

[25] Interviews with at-Tuwartl ‘All bin Mu’allim, July 25 and 26, 1976.

[26] As-Susi’s voluminous writings provide particularly useful anthologies of these conventions. Since he was aware that he was documenting a world of learning that was not being transmitted to a younger generation, most of the literary allusions in the writings which he cites are fully annotated, a practice not characteristic of most writings of the period.

[27] Rolleaux-Dugage (1915: 67) mentions in passing that the cost of becoming mock sultan in Marrakesh in 1913 was 1,200 francs, and that the real sultan presented the student one with a cardboard crown and a horse. For 1919, see the general description of Wattier (1919).

[28] I am grateful to Muhammad Aafif for providing this example.

[29] The overall neglect of the importance of peer learning (e.g., Makdisi 1981) in studies of Islamic education is still remarkable, even considering the silence of traditional sources. McLachlan (1974: 474) describes a similar neglect in the study of colleges in early nineteenth-century America, despite the fact that the core of learning during this period was “an extraordinarily intense system of education by peers.”

[30] Unlike ‘Abd ar-Rahman, Si Muhammad belonged to none of these associations.

[31] A quality praised by men of learning was the ability to compose verses for particular occasions such as appointments to government posts, weddings, and the birth of children. There was a constant circulation of such commemorative verses orally and in writing among men of learning. Most such poetry involved little originality, as its creators drew upon stock phrases, conventions, and images, but these creations deliberately avoided the diction and syntax of “commoner” speech.

[32] Because the Alliance Israelite had been active since the nineteenth century in Marrakesh in providing education in French to Moroccan Jews, many had become clerks and interpreters for the protectorate government and commercial interests. If indeed a film was then being prepared in Marrakesh, it would have been perceived as having been organized by “Jews,” because local Jewish interpreter/assistants would have been the most readily available and the only personnel of any film crews likely to be able to converse in Arabic.

[33] For discussion of Islamic men of learning in other cultural contexts in the Muslim world, see Baer (1971), Bulliet (1972.), Green (1976), Hourani (1968), Keddie (1972), Lapidus (1967), Mottahedeh (1975, 1981), and Saad (1983).

[34] In speaking with me on general themes, ‘Abd ar-Rahman was careful always to refer to non-Muslims by their nationality, and corrected members of his household when they employed the more popular usages of “Christian” (nasrdni) and “Roman” (rumt). In speaking of his own past, he used the terms he then employed.

[35] In 1950 Bu Na‘mani was appointed deputy {khalifa’) to Hajj Thami al-Glawi, although he lost this post after 1953 because he was a “neutral” who did not support the French deposition of the sultan that year. After independence in 1956 he became Pasha of Agadir, a post which he retained until the earthquake which destroyed much of the city in 1960.

[36] Because he also declined to support the new sultan, ‘Abd ar-Rahman was also removed from his brief tenure as qadi of Bzu on April z8, 1954.

[37] One of the few colonial observers aware of the significance of these debates was Jacques Berque. See Berque (1974: 162–188) for an excellent discussion, based upon his contemporary notes and discussions with the principals, of the concerns of religious intellectuals in the 1930s.

[38] A leading figure at the Yusufiya during the 1930s who was recognized by the French as “rector” (ra’ts) of the Yusufiya from 1941 until his death in March 1944. He is the author of a history of the Yusufiya (‘Uthman 1935), printed in Cairo, which unfortunately stops before the nineteenth century.

[39] Kittani hostility to the ‘Alawi dynasty culminated in ‘Abd al-Hayy’s active collaboration in colonial efforts to discredit Muhammad bin Yusif and support Mulay ‘Arafa, the “puppet” sultan enthroned by the French after Muhammad bin Yusif’s exile to Madagascar in 1953.

[40] ‘Abd ar-Rahman here telescopes a complex series of events. In March 1909, to discourage rebellion during his absence in Marrakesh, Sultan Mulay ‘Abd al-Hafid intended to secure several Fassi notables as hostages. When news of the sultan’s intentions reached Muhammad al-Kittani on March 19, he secretly fled to the Middle Atlas mountains. He was eventually brought back to Fez, where he later died from beatings he received in prison (see Burke 1976: 133–134).

[41] Sidi is an honorific generally reserved for royalty and prominent marabouts. Bu Na‘mani here deliberately uses it to elevate ‘Abd ar-Rahman in status. The ordinary term of address would be Si.

[42] I am grateful to Muhammad Aafif for explaining to me the implications of this style of writing in Morocco.

[43] This account is based upon a narrative written by ‘Abd ar-Rahman dated March 29, 1945, with supplementary verbal commentary provided in July 1976.

[44] Like other men of his generation, ‘Abd ar-Rahman frequently interchanges the terms “sultan” and “king.”

[45] A copy of this document was taken from official files in Casablanca, translated into Arabic by Sa‘id Guessous, a translator-interpreter working with the French administration, and mailed to Qadi Ahmad. Evidently the mails were often regarded as secure. I saw the document preserved in its original envelope. The report was written by Captain “Dulur” [the name is given only in Arabic transcription], Chief of the Bureau des Affaires Indigenes of Ntifa and Azilal, and is dated June 2.5, 1937.

[46] For an excellent general account of the rise and fall of the French native affairs administration in rural Morocco, see Bidwell (1973). Vincent Monteil (1961), himself a onetime Affaires Indigenes officer, provides a thoughtful complementary “insider’s” account.

[47] In July 1941, a secret circular from the office of the Resident-General ordered each local post to draw up contingency plans for the defense of French administrators and settlers in rural areas. Cabinet du Resident-General, circular 422 DM, dated July 4,1941. Copy preserved in the file, “Securite locale,” archives of the Controle Civil, Boujad.

[48] I have been unsuccessful in efforts to identify this officer more precisely. In any case, what is important in the present context is ‘Abd ar-Rahman’s conception of the officer. ‘Abd ar-Rahman thinks that he was transferred to a post near Fez, and that he died in the early 1950s.

[49] Interview, Hajj Ahmad bin ‘Abd as-Salam al-Bu ‘Ayyashi, Tangier, June 23, 1973. Hajj Ahmad, himself a qadi in Spanish Morocco, found himself appointed as a “super-qaid” {qa’id mumtaz} shortly after independence, although like others in his situation, he spent his efforts in securing a transfer back to the Ministry of Justice.

[50] Interview, Mulay Hasan al-Bziwi, Marrakesh, July 26, 1976. From 1949 to 1952, Mulay Hasan was deputy pasha of Marrakesh. His role as a confidential informant for the king went undetected until 1952, when the pasha succeeded in removing him from office.

[51] This discussion is based upon events at the Yusufiya, although procedures at the Qarawiyin appear to have been broadly analogous. 1 am especially indebted to at-Touarti ‘Ali bin al-Mu‘allim, a former member of the Yusu-fiyya’s Scholarly Council, ardent bibliophile, confidant of Mukhtar as-Susi and, in the late 1950s, liquidator of the estate of Hajj Thami al-Glawi, for sharing with me his perceptive comments on the workings of the Yusufiya under the French. Interviews, Skhirat and Marrakesh, June and July 1976.

[52] Thomas Dichter (1976), a former teacher in a Moroccan secondary school in the 1960s who subsequently returned to study it as an anthropologist, provides an excellent “insider” account of schooling and attitudes toward it. The French also maintain a network of private lycees, administered through the Mission Universitaire et Culturelle Fran^aise. These schools ostensibly are for the children of French citizens in Morocco, but most of their students are from the Moroccan elite. In addition, the various military and police services run their own academies for the equivalent of secondary and postsecondary education. Unlike their civilian counterparts, these schools are adequately funded and staffed and have suffered no known disruptions from protests or strikes.

*** Notes on contributors

Julia A. Clancy-Smith is Assistant Professor of Middle Eastern and North African History at the University of Virginia, Charlottesville. She received a PhD from the University of California at Los Angeles in 1988. She also holds a BSFS and an MA from Georgetown University. She is the author of ‘Saints, mahdis and arms: religion and resistance in nineteenth-century North Africa’, in Edmund Burke III and Ira Lapidus (eds)

Islam, Politics and Social Movements (University of California Press, Berkeley, Calif., 1988) and ‘In the eye of the beholder: the North African Sufi orders and colonial production of knowledge, 1830–1900’, African Journal, 16, 1988.

Dale F. Eickelman is the Ralph and Richard Lazarus Professor of Anthropology and Human Relations at Dartmouth College, Hanover. His field research in the Middle East includes extensive studies of religion and politics in Morocco, the Sultanate of Oman, and elsewhere. His publications include: Moroccan Islam (University of Texas Press, Austin and London, 1976; Arabic translation 1988); The Middle East: An Anthropological Approach (Prentice-Hall, Englewood Cliffs and London, 1981; 2nd edn, 1989); Knowledge and Power in Morocco (Princeton University Press, Princeton and London, 1985); and numerous scholarly articles and contributions to edited books. He is currently completing a study on changing perceptions of religious and political authority in the Arabian Gulf.

Sam I. Gellens teaches history at the Ramaz School in New York City. A specialist in Islamic social history, his Columbia University dissertation was awarded the Malcolm H. Kerr Dissertation Prize in Humanities in 1986 by the Middle East Studies Association of North America. He is the author of a forthcoming monograph, Learning and Local Identity in Medieval Islam: Egypt, 218-487/833-1094 (Institut Fracais d’Archeologie Orientate, Cairo).

Kemal H. Karpat is Professor of History at the University of Wisconsin, Madison. He is author of The Gecekondu: Rural Migration and Urbanization in Turkey (Cambridge University Press, Cambridge, 1976); and Turkey’s Politics: the Transition to a Multi-Party System (Princeton University Press, Princeton, 1959), and editor of Political and Social Thought in the Contemporary Middle East (Pall Mall, London, 1968; Praeger, New York, 1982); and The Ottoman State and its Place in World History (Brill, Leiden, 1974).

Robert Launay is Associate Professor of Anthropology at North-western University. He has published an ethnography of the Dyula of the northern Ivory Coast, Traders Without Trade: Responses to Change in Two Dyula Communities (Cambridge University Press, Cambridge, 1982), and is currently completing a second book, Silamaya: Controversy, Change and Identity in Islam Among the Dyula.

Mary Byrne McDonnell is a Program Associate at the Social Science Research Council in New York. She completed her studies at Columbia University in 1986, where she specialized in South-east Asian and Middle Eastern social history. From 1981–4 she conducted fieldwork in Malaysia on the socio-economic impact of the hajj on Malay society over the past century at both the national and the local levels. She was

particularly interested in comparing the role of the hajj in the urban and rural environments.

Ruth Mandel received her PhD in Anthropology from the University of Chicago. She has conducted fieldwork among migrant workers in West Berlin and Paris, and with repatriated workers in Turkey and Greece. She is a Lecturer in Social Anthropology at the University of London, continuing her studies on the Gastarbeiter (guestworker) community. She has contributed to several journals and edited volumes.

Muhammad Khalid Masud is editor of Islamic Studies, a quarterly journal of the Islamic Research Institute, Islamabad. He has taught Islamic Law at the Institute of Administration, Ahmadu Bello University, Zaria, Nigeria, at the Qaid-i-Azam University, Islamabad, and at the International Islamic University, Islamabad. He is author of Islamic Legal Philosophy (Islamic Research Institute, Islamabad, 1977), and Iqbal and the Concept of Ijtihad (in Urdu) and several articles on law and social change in Islam.

Barbara D. Metcalf is Professor of History at the University of California, Davis. She is author of Islamic Revival in British India (Princeton University Press, Princeton, 1982), and editor of Moral

Conduct and Authority: The Place of Adab in South Asian Islam (University of California Press, Berkeley, 1984).

Abderrahmane El Moudden is Assistant Professor of History at Mohammed V University, Rabat, where he received his Doctor at de Troisieme Cycle on ‘The relations between rural society and the central government in 18th and 19th century Morocco’ (1984). He is currently at Princeton University, studying Moroccan-Ottoman relations in the sixteenth through nineteenth centuries.

James Piscatori is Senior Lecturer in Middle East Politics at the University College of Wales, Aberystwyth. Among his publications are Islam in a World of Nation-States (Cambridge University Press, Cambridge, 1986) and an edited book, Islam in the Political Process (Cambridge University Press, Cambridge, 1983).

Nancy Tapper is Lecturer in the Anthropology of the Arab World at the School of Oriental and African Studies, University of London. She has conducted fieldwork among pastoral nomads in Iran and Afghanistan and has published numerous articles on women, marriage, and politics in these societies. Her most recent fieldwork has been on women and religion in a provincial town in Turkey.

Alex Weingrod is Professor of Anthropology at The Ben Gurion University of The Negev. He is author of Reluctant Pioneers: Village Development in Israel (Cornell University Press, Ithaca, 1966) and editor of Studies in Israeli Ethnicity: After the Ingathering (Gordon & Breach, New York, 1985).

*** Note on transliteration

Any book that draws upon materials in Arabic, Persian, Urdu, Malay, Turkish, Dyula, and Hebrew poses considerable problems of transliteration, especially as many contributors stress colloquial rather than literary usages. The system employed here, with as much consistency as possible, has been to use the system adopted by the International Journal of Middle East Studies for Arabic, Persian, Turkish, and Hebrew, with additions to represent other languages as necessary. Diacritics have been omitted, except in the glossary, where they are given in full. As suggested by Judith Butcher's Copy-Editing: The Cambridge Handbook, the plural of words has been formed by the addition of an "s" to the singular, except in such cases as 'ulama' in which the transliterated plural form has become standard.

*** Preface

The subject of Muslim travel is unexpectedly complex. One might assume that religious doctrine prescribes certain kinds of travel, and that the ritual movement of Muslims leads to a heightened identification with Islam and with fellow Muslims. But the chapters of this book question such conventional wisdom. In looking for the answers to the basic questions that underlie this discussion — What does travel mean to Muslims? What are its motivations? What are its effects — we are struck by a pervasive intricacy and even ambiguity.

When the first question on the nature of Muslim travel is considered, it seems judicious to infer that, like all travel, it is principally a journey of the mind. Travel is pre-eminently an act of imagination, and, as our contributors amply demonstrate, a literal reading of hajj (pilgrimage), hijra (emigration), rihla (travel for learning and other purposes), ziyara (visits to shrines), and even labour migration, is inappropriate. These obviously constitute physical movement from one place to another, but, owing to the power of the religious imagination, they involve spiritual or

temporal movement at the same time. Muhammad Khalid Masud indicates that one sense of hijra is movement of the soul from a state of corruption to one of purity, and Julia Clancy-Smith shows that for Rahmaniyya adepts in North Africa, ziyara to the tomb of their founder guarantees movement from unhappiness to happiness in this world, and from damnation to salvation in the next.

There may also be imagined movement across gender or ethnic lines. Nancy Tapper points out that for Turkish women, participation in the hajj, ziyarets to local shrines and religious festivals becomes an act of affirmation that, before God, they are equal to men, and that they too can attain salvation. Referring to a non-Muslim but parallel context, Alex Weingrod shows how visits to saint shrines in Israel are, for Moroccan and Tunisian Jews, a sign of their passage from hesitant, socially and politically distinct

immigrants to self-confident, equal citizens. Finally, Muslims may envision travel across time as a substitute for physical travel, as when, in the case of the pre-twentieth-century Dyula whom Robert Launay describes, travel to the Hijaz was unnecessary to trace one's line of intellectual descent (isnad) back to illustrious Muslims of the early Islamic period.

Yet the very idea of travel, however much it may project the believer across spiritual space and time, and overcome barriers of gender and politics, cannot be separated from the anticipation of return to home. Here, too, travel is an inventive journey. Whether home is the place of departure, as in the case of the hajjis whom Barbara Metcalf and Mary McDonnell describe, or a new place of settlement, as in the case of the Turkish Gastarbeiter in Germany whom Ruth Mandel details, or the Balkan muhajirs on whom Kemal Karpat writes, travel has inevitably invested it with new meanings. Travellers may, as the labour migrants generally do, long for the old home; or, like the children of those migrants, increasingly regard the old as incomprehensible and in any case irrelevant; or, like the Balkan muhajirs to Turkey, believe that they have at last gone home. What seems clear is that travel and home — motion and place — constitute one process, and that in travelling beyond one's local time and space, one enters a mythical realm where home, the "fixed point" of departure and return, is reimagined and further travel inspired. In the Enigma of Arrival, V.S. Naipul (1987: 318) testifies to the power of this process when he speaks of:

Places doubly and trebly sacred to me because far away in England I had lived them imaginatively over many books and had in my fantasy set in those places the very beginning of things, had constructed of them a fantasy of home.

When we turn to the second question — the motivations for travel — we confront head on the role that religion, and specifically Islam, has to play. It is tempting to take the view that religion, as a set of universal and authoritative beliefs and practices, enjoins certain conduct

upon Muslims everywhere. But the contributors to this volume illuminate inherent tensions that belie such a decided view. The presumed constancy of dogma competes with the actual shift in meanings that dogma acquires in differing contexts, and the presumed universality of the Islamic community competes with the local communities in which Muslims actually live. But what also emerges is that the co-existence of these contrasting tendencies, however forced it may seem in the abstract, is largely unremarked upon by Muslims themselves.

Ideas such as hijra and rihla do change over time and in various places, but, as Masud observes, there is also a “semantics of expectation” that makes such key terms instantly recognisable, and valued in themselves, as signposts on a changing landscape. In a similar manner, Muslims seem effortlessly to juggle local and multiple identities — villager, tribesman, woman, citizen — with the broader identity of believer and to legitimise them all by reference to the idiom of the cosmopolitan community of believers (umma). This is not to suggest, however, that the modes of Islamic belief are uniform. Rather, as Launay points out, a greater sensitivity to the tenets of the law among the Dyula — “shari‘a-mindedness”, to use Hodgson’s evocative phrase — is related to economic liberalisation and the rise of a more pronounced social hierarchy. In addition, Tapper notes that the emphasis which Turkish women place upon travel for religious purposes depends to a considerable extent upon their general attitude towards the role of men and women in society.

The image of a flexible Islam in thought and practice thus emerges in this book, and we see that the motives for action in general, as for travel in particular, are inevitably mixed — a combination of holy reason and social, economic, and political concerns. As the introduction points out, ideas are unquestionably important spurs to social action, but they are not the sole determinants. Our contributors show that such factors as status, self-affirmation, and economic interest are equally as important as the sense of obligation, and that such categories as class, ethnicity, gender, and historical memory are as relevant as doctrine.

Sam Gellens, for example, observes that rihla in the tenth and eleventh centuries was often intimately connected with trade and associated with a certain class structure — traders, commercial middle-men, and intellectuals — and both Metcalf and McDonnell demonstrate that the hope of enhanced social standing accounts, in part, for why people of varying social backgrounds undertake the pilgrimage to the holy places. The attractions of the “centre” may be several, therefore, but what also emerges in these pages is a questioning of the received wisdom that there is but one validating centre in Islam. To use Tapper’s expression, a more complex “sacred geography” appears, as does a more subtle sense of location, of where Muslims stand in relationship to each other and to religiously defined space. The need to travel to saintly shrines or, as Mandel shows, the need of Turkish workers in Europe to travel back to Turkey, may be as compelling as the doctrinally enjoined pilgrimage to Mecca and Medina.

In turning to the third basic question, concerning the effects of travel, we find that a heightened identification with Islam may

result. However, as Abderrahmane El Moudden says of Moroccan travellers in the sixteenth to the eighteenth centuries, an ambivalence of identity is also as likely, if not more likely, to result. Cornell Fleischer (personal communication) suggests that the consciousness of locality and difference appears to have intensified in the seventeenth and eighteenth centuries throughout the Middle Eastern Muslim world in general. This intensification allows one to infer that the transition to territorially-based plural communities preceded the advent of western powers in the region, the normally accepted bench-mark for the emergence of the “modern” era.

From this transitional period suggested by Fleischer and El Moudden to the present, the travellers for religious purposes have, as in earlier periods, been aware of the community of faith and goals that ties them to fellow travellers. But at the same time, they have come into direct contact with the real differences of language, sect, race, and customs that unavoidably make up the umma. Contrary to the conventional wisdom of western social scientists, therefore, the encounter with the Muslim “other” has been at least as important for self-definition as the confrontation with the European “other”.

Indeed, even as travellers sense participation in a great enterprise, they become aware of the lack of commonalities and are sometimes overwhelmed by them. Whether it is the sixteenth-century Arab traveller to Istanbul whom El Moudden describes; or Kemal Karpat, the Romanian-born ethnic Turk who migrated to Turkey in the 1940s; or the Europeanised Turkish worker returning to Turkey whom Mandel describes, each has the unsettling experience of feeling different within a Muslim community when only familiarity, even solace, was anticipated. The ironic counterpoint to travel broadening one’s consciouness of the spiritual unity of the umma is that travel may define frontiers between Muslims and thus narrow their horizons.

Travel can also be politically subversive. Launay explains how the Dyula, who travelled to Mecca and Medina for pilgrimage or religious learning, returned to advocate greater orthodoxy — thus undermining the established order based upon local notions of scholarly and political legitimacy. Mandel shows how the Turkish Alevi Gastarbeiter who are marginalised twice over — Turkish in Germany, Alevi in Sunni Turkey — reshape their Islamic and political identities in their new environment and, in the process, seek to reverse the pattern of Sunni domination and even to create an Alevi nationalism. Weingrod demonstrates that travel to saint shrines and proximity to saintly baraka (grace) have served as a focal point for Sephardic Israelis who take pride in their recent

assimilation into the society, and have thus helped to encourage the growth of rightist-nationalist political ideologies among them.

But governments, always mindful of the political potential of Islam, have sought to co-opt religious practice. The Turkish government has promoted the identification of “modern” Islam with republicanism and, as McDonnell documents in the case of Malaysia, the hajj has to a considerable extent been nationalised. Pilgrims travel in national delegations under the auspices of the national bureaucracy and spend the brief time in Arabia in minimal contact with other pilgrims. Popular identification of the nation with Islam is in the government’s interest, and a probable result. Yet political identities, like religious ones, are constantly re-imagined, and the effects of travel are as ambiguous as the motives for it.

In the preparation of this book, we have become acutely aware that the role of travel in Muslim societies and in Islamic doctrine is not a topic which has been systematically explored by historians or social scientists. Moreover, we have tried to encourage thinking on a common topic among scholars concerned with historical periods ranging from the first centuries of Islam to the present, and with Muslims in societies ranging from Malaysia and West Africa to Western Europe, and from different traditions of scholarly enquiry. This has posed particular challenges. As we suggest above, at an abstract level, travel for pilgrimage, scholarly learning, proselytisation, visits to saints’ shrines, commerce and migration, both forced and voluntary, has contributed significantly to shaping the religious imagination in both the past and the present. Moreover, travel for these various purposes is not mutually exclusive. None the less, there appears to have been an implicit scholarly division of labour among disciplines, with historians and scholars in the history of religions focusing upon various aspects of the pilgrimage and the religious imagination, while social scientists have for the most part concentrated upon migration, particularly labour migration, to the exclusion of considering its impact upon religious expression and thought.

As we suggest in the bibliographic essay at the end of this volume, until the mid-1980s, few studies crossed this line. We find it encouraging that this implicit disciplinary division of labour has become increasingly blurred in recent years. Anthropological studies of pilgrimage and other forms of travel have now become much more common. Indeed, some of the most significant recent contributions are studies of Muslims who have migrated to or settled in Europe. Likewise, most of the chapters in this volume

derive from recent field research or historical inquiry, or, as in the case of Masud, represent new directions of research by senior scholars.

As in any collective enterprise intended to represent cross-disciplinary approaches, we have faced a more substantial editorial challenge than would be the case with an endeavour in which most contributors share the same disciplinary training or are at comparable levels in their scholarly careers. Whereas some contributtions represent single-case studies, the comparisons built into many of the papers — across region (e.g. Gellens), time (e.g. El Moudden, McDonnell, and Metcalf), or both (e.g. Masud) — suggest a surprising level of

linkages. Other contributions, including the introductory chapter by the editors, are intended to set a framework for wide-ranging comparison and to elicit the conceptual issues, both implicit and explicit, underlying this book.

Not the least of the challenges in creating this book has been to encourage contributors from varying disciplines and national scholarly traditions to speak to one another in a mutually intelligible language. The conceptual language invoked by participants in one discipline as practised in, say, North America, might adequately convey in shorthand form the lineage of an idea or a particular theoretical orientation, but may appear as impenetrable jargon to other scholars. Indeed, as an anthropologist and a political scientist respectively, we acknowledge that the contributions from social scientists, including ourselves, have often verged upon the semi-private vocabularies of our respective trades, while the early drafts of other contributions often unrealistically assumed prior knowledge of specific historical periods and places. As editors and contributors, we have made an effort in good faith to avoid the private languages of disciplinary specialists.

Chapters 2 and 3 provide complementary discussions of doctrines of travel in Muslim societies. We begin with a discussion of doctrine because it has often been argued that Muslims share more explicit doctrinal tenets enjoining movement than do the followers of other major religious traditions. The originality of Muhammad Khalid Masud's analysis of doctrinal issues is twofold. First, in contrast to many accounts of Muslim jurisprudence, he stresses the necessity of considering the contexts in which doctrines are developed and propagated. Second, he considers how the rise of "new intellectuals" in the Muslim world — i.e. those who have graduated from western-style schools and universities — affects the interpretation and justification of "traditional" doctrine. He argues that one consequence of not being tied to the interpretive styles of the traditional schools of jurisprudence is to create an opening for extremism, although the impact of such radical interpretations is often "partial and ephemeral".

Sam Gellens's chapter complements Masud's in indicating the importance accorded to travel in the hadith literature, and the practical importance of travel in the forms of pilgrimage, trade, and, in particular, scholarship. Gellens argues that doctrines of travel and travel for the sake of religious learning framed issues of locality, universality, and identity in the medieval Muslim world from the ninth through the eleventh centuries. Through comparing three contemporary Muslim societies in communication with one another — Andalusia, Egypt, and Khurasan — Gellens suggests why travel for learning shaped a cosmopolitan sense of identity in all cases, but was particularly important in shaping a sense of local identity for Andalusia, which sought intellectual succor from more secure centres of learning. Indeed, one of Gellens's major points is that the changing military and political conditions — particularly as Andalusia's relations with its Christian neighbours to the north steadily deteriorated — led to shifts in notions of centre and periphery. Although he only briefly considers the importance of scholarly travel in shaping the sense of identity of Jewish communities in the medieval Muslim world, he points out important parallels with Muslim senses of centre. For both communities, Andalusia became increasingly peripheral, and Iraq, Egypt (and, in the Jewish case, Tunisia) became increasingly "central".

Chapters 4 and 5 deal with travel accounts, particularly those related to the hajj, in different historical periods. Abderrahmane El Moudden’s account compares the importance of travel — in particular, for commerce, diplomacy, and learning — to Moroccans from the sixteenth through the eighteenth centuries, the subtle ways in which practice and perceptions varied over time and place, and the importance of travel accounts for those unable to undertake such arduous journeys. If, as with the accounts analysed by Gellens, travel offered the opportunity to imagine the wider, encompassing horizons of Muslim community, it also progressively contributed to an emerging awareness of being at the frontier of the Islamic world and of a sense of distinctive political identity.

Barbara Metcalf similarly deals with differences in travel accounts from the Indian sub-continent from the late eighteenth century to the present. As she points out, the pace at which this genre of narratives is produced accelerates with the onset of British colonial rule, in part because the new technology of the printing press accelerates their dissemination. Indeed, by the late nineteenth century many accounts began to be produced in English. She notes in particular the changing sense of person which emerges over time from these accounts, and the growing importance of individual, internalised experience. Yet even if many of these accounts internalise European notions of governance and some imitate European travel writing, they do not simply mirror European individualism.

The section on pilgrimage and migration emphasises how these experiences complement one another and shape

religious experience. In Chapter 6, Mary McDonnell discusses patterns of pilgrimage from Malaysia over the past century, assessing how changing economic, political, and social contexts have affected its conduct and significance. In the latter part of the nineteenth century, the typical pilgrim was a member of the elite. Increasingly since the 1930s, however, pilgrims have come from the middle classes and, since the 1970s, from the wealthier rural areas. In earlier periods, almost no women participated in the hajj, but their participation has steadily increased since the 1930s to the point where nearly half of all Malaysian pilgrims today are women. Parallel to trends described by Metcalf, McDonnell shows how the pilgrimage has both a communal and an individual importance and how “external” considerations of status blend with “internal” considerations of state of mind. Moreover, she shows that enhanced state supervision of the hajj is one of the most important developments of the post-colonial period. Contrary to the general trend established in this book, however, McDonnell argues that Malaysians have an undifferentiated concept of centre — modern-day Saudi Arabia — and are drawn to it because of the perception of their own “peripheral” position. The result, she argues, is a suffusion of the periphery with the “central” values of a non-revivalist, politically accommodationist Islam that the Saudis espouse and the Malaysian government favours.

In Chapter 7, Kemal Karpat deals primarily with Muslim identity in the Balkans from the mid-nineteenth century to 1914, and the ways in which forced migrations during this period — an all too common occurrence — served as catalysts for re-imagining complex national, ethnic, and religious identities. If, unlike Metcalf, Karpat emphasises changes in collective, communal identities, we find particularly fascinating the juxtaposition of his historical narrative with a postscript in which he describes his personal experience of migration from Romania in the 1940s.

Karpat's argument echoes what might be called the "Turkish-Islamic synthesis". In his view, an apolitical sense of Muslim identity, which obtained in the pre-nineteenth century Ottoman Empire, was transformed into a politicised one largely because of the new immigrants to Turkey. This transformation, in turn, is made to account for the emergence of the Turkish nation-state.

The assumptions underlying the "Turkish-Islamic" synthesis are admittedly controversial. But Karpat's narrative, representing a distinct school of thought, becomes all the more useful because of its admixture of "objective" and "personal" histories, with the one informing the other. Karpat's essay, like all historical representations, may be read as an ethnographic text.

In Chapter 8, Ruth Mandel traces how the sense of centre becomes transformed over time for Turkish workers in Europe, so that West Germany itself becomes "central" for the second generation while Turkey becomes peripheral. Turkish Alevi Muslims, often perceived as a "fifth column" in the Ottoman Empire and identified with the political left by Sunni Muslims in contemporary Turkey, have emerged in West Germany as the dominant group instead of Sunni Muslims. The Alevis consider themselves to be more "democratic, tolerant, and progressive" than their Sunni Turkish counterparts and feel less threatened by German society. In Turkey, Alevi identity is constructed primarily in contrast to that of Sunni Turks; in Germany, both Germans and Sunni Turks become the "other".

The final section, "Saints, Scholars, and Travel", concerns more particularistic forms of travel for religious purposes. In scholarship on Islam and in the history of religions in general, there is often a tendency to assume that the more encompassing formulations of belief and practice shared by the community of believers inevitably overshadow more particularistic and locally oriented ones in importance. In Chapter 9, Robert Launay's account of scholarly credentials among the Dyula indicates the links between travel, commerce, and religious learning, but cautions against the a priori assumption that travel and study in the Arabic-speaking Middle East were more prestigious than access to local knowledge. However, local controls over knowledge were challenged by revivalist movements from the mid-nineteenth century. Their adherents had gone to the Arab East in search of superior knowledge. Upon returning, they questioned the social distinctions of the religious and political status quo, based upon both heredity and a monopoly of Islamic knowledge. This tension between locally derived answers to what is Islam and "being Muslim", and answers

inspired by contact with the wider community of the believers, continues to the present period.

In Chapter 10, Julia Clancy-Smith's essay on the Rahmaniyya religious order in Algeria during the late eighteenth century also concerns the shifting balance between local, regional, and wider bases for religious authority. Her account combines attention to the biography of the movement's founder, regional politics, and

social history to explain why new networks of religious authority arose during the late eighteenth century. She demonstrates the way in which the founder gained adherents during his travels at a time of political uncertainty, and the importance subsequently attached to visits to his shrines. The individual act of self-assertation that such visits represented also enhanced a sense of solidarity which sustained the new brotherhood.

In Chapter 11, Alex Weingrod's study of visits to saints' shrines in Israel since the early 1960s amplifies this connection between individual movement and collective religious experience. For the newly arrived Moroccan and Tunisian Jews, or for those who have long settled but who have not socially or politically "arrived", the hope of acquiring saintly blessings can be comforting, and even transforming. The sense of being part of a great movement results, and in fact the shrine visits often take on institutional form through the establishment of associated educational and social centres and through their explicit politicisation. Although obviously not directly concerned with the Muslim world, Weingrod's essay provides an instructive comparison with it. The Israeli Sephardic experience points to a larger Maghribi culture shared by both Muslims and Jews and which leads to the linking of spiritual fulfilment with periodic visits to saints' shrines and even to the need for "living saints".

In Chapter 12, Nancy Tapper demonstrates that visits to saints' shrines, often thought to be especially pronounced in the Maghrib, are significant in Turkey. She also confirms that travel associated with religious purposes has more to do with spiritual and social compensations than with doctrine, and shows that visits to shrines are officially discouraged, but that women especially undertake them. The opportunity to travel and visit together, without men present on these occasions, provides companionship and a network of support, and when men and women do travel together, as on the hajj or to visit family members at the end of the month of fasting, women are afforded the opportunity to assert their equality.

With these examples of travel provided by Tapper and the other contributors, we have juxtaposed ideas and activities whose generic diversity is vast. Defenders of comparative studies would acknowledge that these studies are difficult to elaborate in cases such as the wider Muslim community in which the existence of a presumed cultural whole may render its independent units virtually indistinguishable. In the search for common elements, it is also

possible that we may force comparisons. Furthermore, to the extent that common elements are found, there is the danger of unintentionally generating an essentialist view of Islam or of being Muslim. We believe, however, that the comparative nature of this volume has its uses. It specifically helps us to avoid what Skocpol (1984: 376) calls “the interpretive tendency to attribute self-contained significance” to each form of travel in the Muslim world that either is initiated for religious purposes or comes to assume religious significance.

Our comparative focus has been facilitated by the collaborative quality of this project. With one exception, the contributions to this book were initially presented in a workshop on “Movement and Exchange in Muslim Societies”, New York, 24–26 April 1986, and in a conference on the same topic held in Princeton, 17–19 September 1987. Both were sponsored by the Joint Committee for the Comparative Study of Muslim Societies of the Social Science Research Council and American Council of Learned Societies, of which the co-editors were members. The committee also generously provided support for the preparation of this volume, the first to result from projects initiated directly by the committee since its formal inception. The editors thank David L. Szanton, Executive Associate, for support rendered at critical stages; Cornell Fleischer, Ladislav Holy, and William R. Roff for reading the typescript in its entirety in an earlier version; Carol Delaney for valuable insights along the way; and Barbara D. Metcalf for ideas towards an appropriate title.

* Introduction

** Chapter One: Social theory in the study of Muslim societies

Dale F. Eickelman and James Piscatori

Pilgrimage and migration in Muslim societies are forms of political and social action. These forms of action, like others, raise basic questions for the contemporary social scientific study of Islam. The most basic issue is how to understand such action — in this case, the actions of Muslims and the thoughts presumed to guide them — in various places and times.

This problem is especially acute because it brings us into the opaque realm, on the one hand, of reasons for action (i.e. why is it undertaken) and, on the other, of the meanings that various actors impute to action (i.e. what impact or change is generated by it). This is to say nothing of the ability of actors to accomplish an action (Giddens 1984: 5–13).

Our argument takes the following course in explaining travel as specific forms of social action within Muslim religious traditions. First, we consider what is meant by “Islam” itself as a social phenomenon in which these actions take place. Second, we indicate the specific importance of travel and its significance as a process of social action in understanding “Islam” and ideas of Muslim community. Third, we consider the idea of motives and “interests”, those culturally and materially informed incentives to travel. In doing so, we seek to clarify key concepts which are relevant in general to social thought in religious contexts and in particular to the issue at hand: doctrine in context; the relationship between centre and periphery; and scale. Fourth, we turn to the complementary issue of effects and identities, those specific social and religious meanings created through travel which inspire changes in how Muslims conceive of and experience “Islam” and the communities in which they live.

*** “Islam” as a social phenomenon

Muslim communities, like all religious communities, are imagined (Anderson 1983: 14–16). They are created — and knowable — through the vision, faith, and practices of their adherents. Faith is accepted and sustained through symbol and metaphor, the very stuff of imagination which not only enlarges adherents’ perceptions but reorders them so that the validity and rationality of religious faith and practice seem only natural (Coulson 1981: 3–8). However, the senses of community which derive from faith and practice are necessarily interpreted and shaped in distinct ways in differing places, times, and societies. Participants may assert that their representations of practice and tradition are stable, uniform, and derive from the distant past, yet an examination of the history of these communities indicates both the diversity of these practices and traditions, and their transformations over time.

The paradoxes encountered by theorists of nationalism apply equally to scholars concerned with religious traditions. Historians, writes Anderson (1983: 14), see ideas of nationalism and nation as “objectively modern”, although nationalists consider these notions to possess a “subjective antiquity”; nationality is formally enshrined in international law but irremediably

particular in its concrete manifestations; nationalisms carry political force yet often reflect a “philosophical poverty or even incoherence Like Gertrude Stein in the face of Oakland, one can rather quickly conclude that there is ‘no there there’”.

In a similar manner, the concept of “religion” is paradoxically consistent and clear to most carriers of particular religious traditions, yet unsettled, and perhaps even inherently ambiguous, in content and form to others — including many committed to these traditions. Religious adherents often assert that their beliefs and practices have been fixed over time, and scholars who have argued for placing religious thought and practice into their different historical contexts have often encountered stiff opposition. In the particular case of Islam, advocates of such studies, including the late Fazlur Rahman (1982, 1985), have often faced criticisms similar to those levied earlier against W. Robertson Smith (1956 [orig. 1889]), who argued for the historical study of biblical texts and institutions. But, as Coulson (1981: 3) says: “When the vital connection between religion and imagination is either overlooked or denied, it is not merely theology or the theologian that suffers. The very life of religion ebbs and becomes infertile”. Indeed, the reality is that religious communities, like all “imagined” communities, change over time. Their boundaries are shifted by, and shift,

the political, economic, and social contexts in which these participants find themselves.

*** Muslim travel as social action

As in other civilisations and traditions, travel is particularly important when considering changes in Muslim imagined communities past and present. Travel creates boundaries and distinctions, even as travellers believe that they are transcending them. In the hope of creating new horizons, travellers set off from home, encounter “others” and return with a sharpened awareness of difference and similarity.

Muslim doctrine explicitly enjoins or encourages certain forms of travel. One is the express obligation to undertake the pilgrimage to Mecca (hajj). Another, hijra, is the obligation to migrate from lands where the practice of Islam is constrained to those where in principle no such constraints exist. Visits to local or regional shrines (ziyaras) and travel in search of knowledge (rihla) provide further examples of religiously inspired travel. Yet other forms of travel unrecognised in doctrine can have equal or even greater significance. For example, Muslims have often mixed travel for trade purposes with religiously motivated travel. Moroccan travellers from the sixteenth through the eighteenth century (see El Moudden, Chapter 4 of this volume) and Dyula ones in the nineteenth and twentieth centuries (see Launay, Chapter 9 of this volume) combined travel and rihla. To take another example, contemporary labour migration within the Muslim world, but also in Europe — called Islam’s new “frontier” in one recent study (Dassetto and Bastenier 1988) and its “suburbs” in another (Kepel 1987) — has facilitated changes in religious institutions and practices at least

as important as those inspired by earlier generations of elite Muslim intellectuals in the Middle East and the Indian sub-continent.

Travel of several kinds is therefore significant for Muslim self-expression, and travel is of course informed by the cultural and social contexts in which Muslims are located. None the less, such phenomena need not be seen as unique to the Muslim world in order for their significance to be affirmed. The argument can be made that pilgrimage as a form of movement is significant in both Hindu and Christian traditions, as it is in Judaism in the Middle East (see Weingrod, Chapter 11 of this volume). Moreover, just as the hijra, the migration of the Prophet and his followers from Mecca to Medina in 622, became a dominant theme in Islamic political thought (see Masud, Chapter 2 of this volume), Walzer

(1985: 142) argues that the biblical story of Exodus has served as a key metaphor — the flight from bondage to freedom — in western political thought over the centuries.

*** Motives and interests

It would be helpful if, with some confidence, we could understand why certain types of persons or social categories in Muslim societies are disposed to undertake pilgrimage, other travel for religious reasons, or economic migration. The difficulty of imputing motives and interests to individuals or peoples is now commonly recognised. The literature of the social sciences offers two suggestive yet incomplete approaches to dealing with this issue.

The first is to examine social status and class position and to presume that the “interests” associated with them inform conduct. It might be assumed, for example, that the educated or intellectual elites are more likely to be influenced by doctrinal considerations, or at least to say that they are. It might also be assumed that those deemed by the upper strata of their own society to constitute the “lower” orders — in terms of birth, gender, ethnicity, education, wealth, or authority — are motivated primarily by social, political, and economic deprivation. The “middle” orders, or the bourgeoisie, would then be assumed to be particularly sensitive to questions of status, both to enhance their image in the eyes of those whom they consider to be above them and to differentiate themselves clearly from those below. Some nineteenth- and twentieth-century pilgrims to Mecca from the Indian sub-continent, for example, wrote accounts of their travels in English (see Metcalf, Chapter 5 of this volume). These accounts were accessible only to the British and British-educated Indian elite. Their authors thereby distanced themselves from both the traditional Muslim elite and other Muslims, and implicitly fulfilled the British image of the good and loyal Muslim.

Tempting though such generalisations may be, however, studies of specific Muslim societies provide contrary interpretations of the relationship between styles of Islamic belief and

social origins. The case of Islamic activism in Egypt is instructive. One observer (Ibrahim 1980: 438–9) suggests that most of the Islamic activists responsible for violent acts against the Egyptian state were from modest, but not poor, backgrounds and were first-generation city dwellers. Another (Kepel 1986: 221) implies that a significant number had professional middle or upper class backgrounds. Still another (Ansari 1984) argues that the most successful activist groups contained persons of varying social backgrounds and that it was this mixture that accounted for their success.

In the case of northern Nigeria, the official report (Federal Government of Nigeria 1981: 79) on the Kano disturbances in 1980 attributed them to rural migrants who had been "brought up in extreme poverty [and] generally had a grudge against privileged people in the society". A recent study (Lubeck 1987) suggests a more complex relationship to social origins. Both industrial workers and marginalised "lumpen" labourers in northern Nigeria are predominantly of rural origin. The industrial workers generally seem to remain active in Qur'anic school networks, and use Islamic symbols and slogans in the effort to negotiate improved working conditions with their employers. The more marginal workers, including seasonal labourers and street peddlers, seem to be more inclined to adhere to itinerant Muslim preachers. It was only this group that was attracted to the millenarian violence of Alhaji Mohammed Marwa, known as Maitatsine ("the one who damns"), instigator of the Kano riots. The distinction between factory and "marginal" workers may partly be explained by the differences in their capability to effect changes in their living conditions.

Yet the specific case of northern Nigeria also suggests that explanations based upon social class or the relationship to specific modes of production cannot in themselves account for motives and interests. It is important, for example, to recall that millenarianism in Africa antedates Islam and that, in present-day northern Nigeria, there is a division between an "establishment" claiming descent from the eighteenth-century religious reformer 'Uthman dan Fodio and those Muslims who, for whatever reason, are not part of it. Thus explanations based upon social class or background must be supplemented by an appreciation of the larger historical circumstances.

The second approach offered by the social sciences focuses upon the rational choice of actors. This approach, in assuming that individuals or groups discern and choose among their interests according to a code of rationality, leaves the disquieting impression that they will reach the same decisions given similar circumstances. In this sense, both interests and rational choice become overly abstract. Apart from the inherent philosophical problem of the relationship between choice and rationality, this kind of conclusion fails to acknowledge that rationality needs to be interpreted and put into context.

The manifestly political example of the 1956 Suez crisis illustrates this. The Shuckburgh diaries (1986: 341) confirm that Anthony Eden, who incidentally had read Persian and Arabic at

Cambridge, thought of ‘Abd al-Nasir as an Arab Mussolini. ‘Abd al-Nasir could proclaim that the time of the Arab nation had come, and that moral power had shifted in favour of the non-aligned movement. Yet in Eden’s view, the Egyptian leader could not fail to see that he still had to accommodate the military and economic might of the great powers. Heikal’s (1986) account of Suez shows that ‘Abd al-Nasir, for his part, believed that Eden could not fail to recognise that the great powers were no longer able to exercise their military options without incurring unacceptable political risks. Both leaders thought that the other was acting irrationally and therefore against his own interests.

This discussion of rationality reminds us of how difficult it is to establish the relationship between motives and social action with precision. None the less, this relationship can be more clearly discerned by elaborating upon its complexity, and that, in turn, suggests, in the case of action in religious contexts — specifically Muslim travel — the need to place doctrine in context, reconsider the centre-periphery dichotomy, and take into account the scale of Muslim societies and communities.

**** Doctrine

Many studies of doctrine imply or assume that it has an independent existence and is invariable across time and place. Committed believers make this assumption, but so do many scholarly observers who may be either sympathetic to Islam or not. Qur’anic injunctions, although almost self-evidently applicable to all Muslims, are none the less necessarily subject to differing social and political interpretations. The injunction to undertake the hajj is not necessarily invested with the same meaning for all Muslims, as those who write devotional literature on the pilgrimage sometimes assert. For Iranian Muslims in recent years, the pilgrimage to Mecca has had a political significance and intent certainly not shared by the keepers of the holy places. Moreover, Muhammad Ilyas, the founder of the transnational reform movement Jama‘ at Tabligh, suggested that tabligh, or proselytisation, is as important as, if not more important than, the hajj itself (Nadwi 1983: 44).

The Islamic notion of almsgiving (zakat) also illustrates the variability of doctrine according to circumstances. Some Muslims contend that zakat is a voluntary act of piety; others maintain that it is obligatory — to be collected and disbursed by the central government. There is also debate as to what percentage of income should be collected and how often. In the particular case of Shi‘i Islam, the relationship between zakat and khums, that portion of income that the Shi‘a give to their leading religious scholars (‘ulama’), is a matter of active debate. The obligatory collection of zakat from bank accounts in Zia’s Pakistan, part of an effort to impose an Islamic order, stimulated Shi‘i opposition. Opposition to the mandatory collection of the zakat also appeared in Saudi Arabia (Piscatori 1986: 179) in the early 1950s and among peasants in Malaysia (Scott 1985).

[[d-f-dale-f-eickelman-james-piscatori-muslim-travel-2.jpg][Figure 1.1 The cover art and title of this book, The Slaughter at Mecca, represent a contemporary, Iranian-influenced attempt to invest the hajj with political significance. Needless to say, the Saudi view of their management of the pilgrimage would be radically different from the one presented here. (Used by permission of the Committee for the Liberation of the Arabian Peninsula, London.)]]

Another example is the interpretation of the well-known Qur'anic phrase referring to the "oppressed" (mustad'afun) of the earth (Sura 4: 97), juxtaposed with the "oppressors" (mustak-barun) (Sura 16: 22–3). These terms have obviously had different meanings throughout history, and possess a special significance for contemporary Iranian Shi'a. The late Ayatollah Khomeini's use of these terms ironically evoked for some of his Iranian audience the secular discourse of the 1950s and 1960s on the dispossessed and the wretched of the earth.

Yet one must do more than acknowledge that the interpretation of doctrine changes according to prevailing economic, social, and political contexts. What is also required is a more nuanced consideration of time. Attempts to distinguish between classical and modern doctrines, for example, inadvertently create crude typologies that obscure the social and political forces which render certain doctrines more acceptable than others at any given time. Take the conventional assumption that the "gate of independent reasoning" (bab al-ijtihad) of Sunni Islamic jurisprudence was effectively closed by the beginning of the tenth century. It is generally accepted that the initial inspiration for this was the decision by the early 'Abbasid court that the interdiction on interpretive licence would support the political status quo. Independent reasoning, so the argument runs, was only re-allowed in the eighteenth and nineteenth centuries with the disruption of Muslim political authority that accompanied growing European hegemony. Liberal reformers such as Jamal al-Din al-Afghani (1893–97) assumed a causal link between the supposed stagnation of Muslim society and the prohibition on independent reasoning. It was presumed that, between the tenth and the eighteenth centuries, legal interpretations somehow went politically unchallenged.

This view belies the reality of both an almost continuous process of interpretation over the centuries and a complex relationship between legal and political authorities (Halleq 1984). Such conventional wisdom is also misleading when applied to the Shi'a. Their supposed continuous reliance on ijtihad, in contrast to Sunni Muslims, simplifies a complex situation in which various factions of Imami Shi'a struggled from the eleventh to the seventeenth

centuries over whether the traditions of the Imams should take precedence over the reasoning of contemporary religious leaders (mujtahids).

A layer-cake form of historical periods, or even the separation of Islamic history into “pre-modern” and “modern” eras, is predicated on a sequential view of history — one authoritative act of domination following another. There are indeed discernible historical shifts in ideas as well as practices — as, for example, in the distinct appearance of rihla texts and their association with the hajj beginning in the twelfth century (see Gellens, Chapter 3 of this volume), and the emergence of an explicit notion of “Morocco” in the sixteenth (see El Moudden, Chapter 4 of this volume). Although less dramatic, generational changes are also important, as testified by the differences between Turkish migrant workers in Germany and their German-born children (see Mandel, Chapter 8 of this volume) or ritual offerings and sacrifices performed by various generations of Pakistani labour migrants in Manchester (Werbner 1988).

The division of history into sharply delineated periods, however, may encourage the assumption that there are dominant doctrines in any given time, unchallenged by competing doctrines and their carriers. An alternative view of time accepts the simultaneity, and the continuity, of ideas which are fundamentally dependent upon the groups, social institutions, and status of those who use and select them.

It is tempting, for example, to make the symmetrical argument that hijra in the classical period meant the obligation to migrate from non-Muslim lands (dar al-kufr) to Muslim ones (dar al-Islam), and that today the notion is principally metaphorical, implying only a spiritual migration. But as this century demonstrates, various ideas of hijra co-exist with each other (see Masud, Chapter 2 of this volume). For some Muslims, hijra means the transition from accommodating state authority to resisting it because of a growing realisation of its illegitimacy. For others, it means the transition from poverty to a better life through affiliation with specific Islamic movements. For the Wahhabiyya of Saudi Arabia, it meant the transition from nomadic to settled life.[1] The Muridiyya of Senegal stand the presumed classical notion on its head. Hijra in their case means emigration from a land where Muslims are in a majority but face poverty, to places such as New York and Paris, where, under the direction of their spiritual leaders and largely perhaps for their benefit, they find economic opportunity (Diop 1985).

**** Centre and periphery

The concept of centre is important in understanding motives and interests because of the appeal the centre, as sacred space, has for Muslims. Proximity to the centre is assumed to invest persons or institutions with greater sanctity and thus, religious or political legitimacy. Muslims pray towards Mecca, and if possible culminate their lives by making the pilgrimage to it. Visits to regional shrines complement the pilgrimage, and such key institutions of learning as al-Azhar in Cairo, the Qarawiyyin in Fez, and the religious colleges of Qum have regularly attracted students and scholars from across the Muslim world.

Sociologists and political scientists who have predicated the success of development upon secularisation find the idea of centre and periphery as the key to their analysis of national and state authority. Indeed, the prevailing orthodoxy of the social sciences from the 1950s through the 1970s was modernisation theory (Binder 1986). It presupposed that a prerequisite of political development, and sometimes of political liberty, was the integration of outlying regions to national and international, political and economic networks through a common educational, economic, and communications system.[2] These ideas have percolated into the study of Islam within both the social sciences and the humanities in such forms as the dichotomy of “great tradition” and “little tradition” (Eickelman 1982: 10–11), the division between “central” and outlying lands, as in the Cambridge History of Islam (Holt et al. 1970), and the idea of I’Islamperipherique among some French scholars.[3]

The first difficulty with such organising schemes is that they presuppose only one centre rather than multiple ones. Can it be said of Shi‘i Muslims that Mecca is more their spiritual centre than Karbala, Najaf, or indeed Qum? Or that Mecca is “central” for an Alevi, for whom the genuine pilgrimage is one of the heart? (See Yalman 1969: 61–2.) Conceptualising the centre in a more institutional or political fashion leads to similar difficulties. When the Turkish Grand National Assembly abolished the caliphate in March 1924, several competitors unhesitatingly claimed the mantle: Egypt’s King Fu’ad, ‘Abd al-‘Aziz ibn Sa‘ud, Sharif Husayn of Mecca, and even the French-dominated Sultan of Morocco.[4] More recently, the elites of Egypt, Saudi Arabia, Pakistan, and, of course, Iran have competed — probably for political reasons — for leadership of the international Islamic movement.

The idea of centrality can be modified to presume an agreed hierarchy (or, indeed, hierarchies) of centres. In this view, the key

to the integration of the community, whether it is the nation-state of modernisation theories or the Islamic community (umma) of pan-Islamic literature, involves the projection of hierarchical order upon the periphery. Yet the problem with this conceptualisation is that it is possible to conceive of forms of integration which do not presuppose such an order. In many parts of the world, and certainly within the Muslim world, there exist multiple linkages among the various ethnic, kinship-based, regional, and religious communities which do not arrange themselves into an agreed ranking or which do not allow the emergence of a code for such ranking. The relations and even alliances among these groups often shift, frequently in ways that block or thwart bureaucracies of the modern state. Terrorist networks in Lebanon and Iran may be extreme examples, but such networks illustrate the fragility of modern state authority and the way in which modern politics may not be so much the struggle of the centre to dominate the periphery, as the struggle of multiple centres to retain their autonomy.

Our basic point is that although there doubtless is a powerful tendency in modern societies towards the establishment and maintenance of central authority, there is a persistence of

other networks of value and authority which are independent, or at least partially independent, of that authority, and do not appear to be on the wane. Thus, the straightforward distinction between centre and periphery is called into question, and the image of the Chinese puzzle may not be entirely inappropriate.[5]

The notion of centrality also becomes problematic if we think in terms of transnational movements. By definition, transnational institutions range across national borders and involve “non-state” actors, although they are not exclusively limited to them. An obvious example is the Catholic Church, and another, clearly, is Islam. But the example of the Catholic Church may be misleading if it leads us to assert that transnational movements require an organisational centre. A specific example in the Muslim world is the Barelwi movement. Although its ideas have spread from the Indian sub-continent, they have done so without the benefit of a clear, authoritative ideological centre such as the Deobandis possessed with their educational institutions (Metcalf 1982; Gaborieau 1986).

Terrorism can be another form of transnational movement. In the context of the contemporary Muslim world, it has become common currency to accuse Tehran, and also Tripoli and Damascus, of masterminding or directing a vast terrorist network whose aim is to intimidate other regimes and eliminate opponents. While these centres have provided political inspiration and material support, it would be incorrect to conclude that local groups committed to violent political action, such as Hizb Allah in southern Lebanon, are merely extensions of these centres. They have agendas, political leadership, and multiple — if shifting — lines of support of their own (Raufer 1987: 213–28).

Finally, in the study of Muslim societies, there has been the almost unquestioned assumption that written texts are more central than oral traditions or other cultural forms of authority. The Qur’an is at the apex of formal sources of jurisprudence, followed by the examples of the Prophet (sunna) and sayings attributed to him (hadith). Legal scholars say that those who practise the subsidiary sources of law, consensus (ijma‘) and independent reasoning (ijtihad), must rely upon the Qur’an, the sunna and the hadith literature to inform their judgement. Yet there are times when the sunna seems to take precedence over the Qur’an in the formation of consensus and the exercise of independent reasoning. In any case, as we have discussed earlier, there is no reason to assume that a standard interpretation of either exists. The significance of texts derives not from their inherent centrality but from the contingent political, social, and

Finally, in the study of Muslim societies, there has been the almost unquestioned assumption that written texts are more central than oral traditions or other cultural forms of authority. The Qur’an is at the apex of formal sources of jurisprudence, followed by the examples of the Prophet (sunna) and sayings attributed to him (hadith). Legal scholars say that those who practise the subsidiary sources of law, consensus (ijma‘) and independent reasoning (ijtihad), must rely upon the

Qur’an, the sunna and the hadith literature to inform their judgement. Yet there are times when the sunna seems to take precedence over the Qur’an in the formation of consensus and the exercise of independent reasoning. In any case, as we have discussed earlier, there is no reason to assume that a standard interpretation of either exists. The significance of texts derives not from their inherent centrality but from the contingent political, social, and economic circumstances of those intepreting them. It is precisely for this reason that a recent re-examination of the origins of the early Muslim caliphate (Crone and Hinds 1986) places as much emphasis, if not more, upon the evidence supplied by coins and Umayyid poetry as upon chronicles and juridical texts.

**** Scale

Most scholars acknowledge the need to place Islamic thought and practice into some sort of context, but do so without sufficient attention to the scale of what they describe. We regard the issue of scale as particularly important (see Eickelman 1987: 23–5). Devout Muslim writers tend to focus upon the universality of the umma, whereas social scientists usually look at less comprehensive entities, whether they are the nations of the political scientists or the local communities of the anthropologists. Each approach has its strengths and drawbacks in examining a phenomenon such as the pilgrimage to Mecca.

Muslim writers emphasise that the pilgrimage is a communal and personal experience shared by Muslims across the world, but overlook many aspects of its impact upon the individual pilgrim returning to his or her local community (see, for example, Esin 1963). Anthropologists have explored its impact at the local level and remind us that in small-scale, face-to-face communities, many facets of religious experience are inherently parochial and intensely personal, deriving their strength from this depth of shared local experience (Appardurai 1986; Turner 1973).[6] They are perhaps less sensitively attuned to pilgrimage as a national event and political act. Political scientists rarely study the pilgrimage — itself a telling commentary — but when they do consider it, it is briefly to make the point that it is an aspect of colonial, national, or international politics (e.g. Piscatori 1983; Kramer 1988). Similarly, studies of contemporary migration focus upon its political and economic implications, but often neglect its important consequences for religious beliefs and practice (e.g. Owen 1985). Colonial scholarship, by way of contrast, took the political potential of the pilgrimage seriously but commonly neglected its local and personal characteristics.[7] Social scientists have until recently tended to downplay the transnational dimensions.

Ideally, analysis of the pilgrimage, and indeed of all travel, requires dealing simultaneously with these several levels of experience and the linkages among them. For the Turkish or Malay hajji, for instance, the pilgrimage is often simultaneously a village, national and international phenomenon (see McDonnell, Chapter 6 of this volume). The problem is all the more challenging because the relationships among these levels are not

necessarily arranged in a nesting order. Nor should they imply a preferred order. There is no reason to presume that the more universal or encompassing community is inherently more attractive than the small-scale particularistic one. Launay (Chapter 9 of this volume) stresses that in the realm of religious learning, locally-oriented regional networks of scholarship in West Africa were for long regarded as superior in authority to those based upon links with the more externally oriented centres of learning such as Mecca. In the later clash between a Wahhabi-influenced vision of Islamic community and the locally inspired vision, the Dyula tended to choose the latter, even as they continued to feel the pull of the former. Of course, the constraints on achieving a sustained awareness of multiple levels and perspectives such as this are substantial: limitations of time and scholarly access, and the continuing hold of disciplinary traditions in spite of the “blurring” of genres that may have occurred.

*** Effects and identities

Up to this point we have been concerned with the complex issue of what motivates social action in the religious environment. We consider now the complementary issue of effect — that is, the specific social and religious meanings that Muslims, or groups of

Muslims, attach to various forms of travel and the changes that travel induces in imagining their communities.

The most perplexing question to ask is whether there is a direct causal relationship between the act of travel and a heightened sense of being Muslim. We initially assumed that there was such a causal relationship in the discussions that led to this book. In time, however, it became clear that the disadvantage of such an assumption is that it implies that Muslim identity is an object whose contours can be specified. As it is impossible to say with certainty at any given moment precisely what Islam is, so is it impossible to specify the contours of Muslim identity. After the Ahmadi riots in Pakistan in 1953, when the Pakistani government asked the Munir Commission to define what a Muslim was, it admitted an inability of religious scholars to agree on such a definition: “[I]f considerable confusion exists in the minds of ‘ulama’ on such a simple matter, one can easily imagine what the differences on more complicated matters will be” (Punjab Government 1954: 215). After twenty years of debate, all that the writers of the Pakistani constitution could agree upon was belief in the oneness of God and the finality of Muhammad’s prophethood (Rahman 1981: 13), but, it should be noted, in the political context of excluding the Ahmadis and thereby making them second-class citizens.

It would also be misleading to assume a uniformity of Muslim identity. The Shi‘a, the Alevis, the Muwahhidun (the Wahhabiyya) of Saudi Arabia, the Ibadiyya, the Isma‘iliyya, the Zaydis, the Sunnis, and so on, all possess — at least on the basis of self-assertion — a Muslim identity. Individual believers or groups of believers may at times more strongly identify, or be

identified, with the concrete sect or rite than with the abstract community of Islam. Indeed, political circumstances often compel individuals and sects to emphasise and act in terms of their more parochial identities. This has been the case with the ‘Alawis in Syria and their Turkish counterparts. The Sunni majority of Syria has, until fairly recently, questioned whether the ‘Alawis are Muslim. The issue has also arisen in Turkey (see Mandel, Chapter 8 of this volume), even as both the questioners and those questioned fervently maintain that there are no divisions within the house of Islam.

In the earlier discussion of centre and periphery, we have seen some of the difficulties in presuming that values and institutional loyalties are hierarchically arranged. The creation of a hierarchy of identities is also misleading. There is an almost infinitely diverse literature on the concept of identities and little agreement on how they are formed and change over time. One way of ordering this complex debate is to distinguish between the “primordialist” and

“instrumentalist” perspectives (Bentley 1987). The primordialist view holds that identity flows from shared cultural or symbolic values; the instrumentalist perspective maintains that individuals or groups assert or emphasise particular identities because they provide a means to maximise their individual or collective interests.

Both views are suggestive but neither is satisfactory. The fundamental difficulty with them is that they predicate the formulation of identity upon a reality that appears abstract and somehow independent of those persons or groups who perceive and participate in it. The specific difficulty with the instrumentalist approach is that it imputes to actors an ordering and clarity of goals, but these goals are necessarily dependent upon ever-shifting cultural and social contexts and are often ambiguous as a consequence (Laitin 1986: 10–11). Moreover, social action, as Weingrod (Chapter 11, this volume) shows, may well generate unforeseen consequences. The growing attachment of Sephardic Israeli Jews to saints and shrines, for example, has reinforced the emergence of radical, right-wing nationalism. As for the primordialist perspective, it leaves the impression that shared cultural and symbolic values are fixed, or at least change only in the long run.[8]

Identities change over time, as studies of migration amply demonstrate. Some migrants continue to regard their land of birth as “home”, while others come to identify primarily with their land of settlement (see Karpat, Chapter 7 of this volume). Others, such as Turkish workers in Germany (see Mandel, Chapter 8 of this volume), or indeed such intellectuals as Salman Rushdie (1988), may feel at home in neither place, at ease in neither their land of settlement nor their land of origin. There may also be multiple, co-existing identities. For instance, Moroccan travel accounts (see Moudden, Chapter 4 of this volume) suggest that travellers identified at various times with their region of origin within Morocco; Morocco itself; the cosmopolitan centres such as Cairo, Medina, or Istanbul to which they journeyed; and (with some ambivalence) the umma. At various times — and perhaps simultaneously — class, ethnicity, nation, and Islam itself have been defining characteristics for Malay pilgrims (see McDonnell, Chapter 6 of this volume).

There is no reason to assume that multiple identities such as those described by McDonnell exist necessarily in a hierarchical order. For instance, Turkish women sometimes identify first with their families and then with other Muslims — men and women — as during the hajj and major religious festivals. At other times, however — as during visits to saint shrines — they identify primarily with other women (see Tapper, Chapter 12 of this volume). That no fixed hierarchical order exists is also demonstrated by another example from South-east Asia. In parts of the Tengger highlands of eastern Java in the nineteenth century, some villages consisted of both Muslim and non-Muslim (Buda) hamlets. The introduction of coffee as a cash crop by the early years of the century led to subtle changes of political and economic balance both between and within these hamlets. In addition, Dutch colonial policies in central Java stimulated

labour migration to the eastern highlands, and links to cities were developed because of the need to market the coffee crop. Questions of identity were intensified and complicated by changes in wealth, status, and regular contact with central Java. Islam was one factor among many, and did not appear to be particularly “central”, as is demonstrated by the example of the first Muslim chief in one of these villages, Besuki.

A wealthy entrepreneur and the first villager ever to make the hajj pilgrimage, he was none the less Javanese and a native son of Besuki, from one of the first local families to break into the coffee industry previously monopolized by the [immigrant] Madurese.

(Hefner 1987: 61–2)

*** Conclusion

We have been concerned with discerning how instances of social action can be understood and illuminated within religious traditions, and, specifically, within Muslim religious traditions. The deliberate use of “traditions” in the plural suggests the view that historical “Islam” does not neatly coincide with doctrinal “Islam” and that the practice and significance of Islamic faith in any given historical setting cannot readily be predicted from first principles of dogma or belief. It is difficult to assess motive and effect in the general realm of social action, but it would seem all the more difficult in the case of religious traditions such as Islam, whose adherents assert that Islamic directives are universal and clear and yet whose manifestations in thought and practice are so varied and indeterminate.

As iconoclastic as it may seem, even the basics of faith are not as luminous or lucid as one might hope for the purpose of eliciting the contours of the religious imagination of the Muslim community past and present. Of the “five” pillars of faith — ritual prayer, pilgrimage

to Mecca, almsgiving, fasting, and the profession of faith — four have been subject to dispute and different interpretation at various times, and continue to be so today (Eickelman 1989: 262–73). Similar difficulties adhere to substituting the search for explicitly shared fixed beliefs transcending time and place with one for authoritative uniform practice, or orthopraxy, since again there are significant divergences among Muslims. Alternatively, it is possible to say, as indeed one Muslim scholar has, that there is no Islam but “islams” (Zein 1977). This approach, intended to displace “essentialist” views, ironically creates a new essentialism by assuming that all the various “islams” are composed of common structural elements. The “islams” approach also underplays the “rather unique” insistence by most Muslims that Islam is “a coherent and closed system” (Smith 1963: 84).

An alternative to the “essentialist” approach of discerning the religious imagination within Muslim traditions is to acknowledge that many Muslims share a common vocabulary of key terms which shape their experience and perceptions of it. These terms, not necessarily Qur’anic or doctrinal, such as the Arabic ‘aql (“reason”) and nafs (“passions” or the “lower” human instincts), appear throughout the non-Arab Muslim world. Such terms were, indeed, often introduced with the spread of Islam. Yet one must exercise caution in assuming that common items of vocabulary constitute a shared language through which ideas of self, society, responsibility, justice and so on shape and express social experience. After all, in any given context there are a number of non-Islamic terms and concepts used by Muslims which equally shape and express ideas such as these. As indicated earlier, the Qur’anic verse referring to the “oppressed of the earth” resonated profoundly in the 1960s with Fanon’s “wretched of the earth” and became consciously (and brilliantly) fused in the speeches and writings of such figures as Ali Shari’ati (d. 1977). For some of the audience for such writings, the Qur’anic language was undoubtedly “central”, but for others it was not. The appeal of the phrase related largely to its bridging of Islamic and non-Islamic concepts. To assume that the concepts and vocabulary identified as “Islamic” carry greater authority than any others may distort how Muslims themselves address these issues.

A more effective first step towards depicting Islam is to acknowledge that there are particular difficulties in understanding action within “religious” fields because, by their very nature, “religions”, or at least world religions, are proposed to various degrees by their adherents to be universal, unaffected by human vicissitudes, and unambiguous. None the less, as Wilfred Cantwell Smith (1963: 85) argues:

the various religious traditions of the world do in fact differ among themselves in the degree to which each presents itself as an organized and systematized entity. If this be so, then one of them may well be the most entity-like. One could suggest that Islam, it so happens, is that one.

We cite Smith at length because, among historians of religion concerned with comparative religious traditions, he recognizes the potential for misleading reification. He argues (1963:

84) that “the various religious traditions are different ... not only in detail but in basic orientation. Each is unique.” If the term “religion” has any utility at all, it is in the family resemblances between and within various world religious traditions. Smith’s caution against reifying religious forms of social action coincides with that of the social sciences. Max Weber (1968: 399) despaired of defining “religion” and confined himself, as we do, to studying “the conditions and effects of a particular type of social action”. Likewise, in characterising religion as a “cultural system”, the anthropologist Clifford Geertz (1973 [orig. 1966]: 90) self-consciously sought to delineate a paradigm for certain types of social action rather than provide a definition. Smith (1963: 194–5) goes so far as to suggest that “religion” as a noun is distractingly ambiguous and is best retained only in its adjectival form.

Even if it is accepted that Islam is the most “entity-like” of the world religions, its internal diversity is compelling. To acknowledge this, however, is not to detract from the claim of transcendental unity. Eternal religious truths, like other beliefs, are perceived, understood, and transmitted by persons historically situated in “imagined” communities, who knowingly or inadvertently contribute to the reconfiguration or reinterpretation of these verities, even as their fixed and unchanging natures are affirmed. In fact, when Muslim discourse and practice are considered in the social contexts in which they are produced, the problem of reification is avoided, as is, at the same time, the inadvertent propensity to render representations of Muslim belief and experience parochial. Islam can be seen as the lives of its adherents at the same time as it is divine revelation; and it can be seen as doctrinally complex and evolutionary at the same time that it is seen as a discernibly unique tradition of discourse.

Some social scientists seek to avoid the problem of how to study Islam altogether by asserting that the very act of studying it creates a spurious “object” of study and deflects attention from underlying social, economic, and political processes. Yet the study of religion remains critically important for the modern social sciences. Even Marxism can be shown to have profound roots in the Judaeo-Christian tradition (West 1987: 240–2). It would make as much sense to avoid studying nationalism and ideas of “nation” because to do so would be to make of them an object, as do carriers of particular senses of national identity. In both cases, the “subjective experiences, ideas, and purposes of the individuals concerned” (Weber 1968: 399) form the necessary point of departure for understanding the underlying senses of imagined community.

The examination of travel in Muslim communities offers the opportunity to address the complexity of issues such as these. Acknowledging a debt to Smith’s writing on religious traditions in general, we suggest that posing smaller questions of religious traditions is in order. Instead of asking “What is Islam?” or “What is Christianity?”, it would be more useful to look at specific kinds of practice and action, such as travel, which constitute religious traditions and inform the religious imagination. The “smaller” questions that we have posed aim at assessing the motives and interests imputed to travel and to its effects and resultant identities. These questions include enquiry into how “authoritative” doctrine emerges, and indeed into how ideas of “authority” and “domination” shift over time and across cultures; a sharper focus upon what is meant by “centre” and “periphery”; and an awareness both that

the idea of Muslim community varies according to scale and that these varying communities interact with one another. As a corollary, clearly what is required is collaborative and cross-disciplinary research of a kind that has been all too rare in the study of Islam and which this volume strives to offer.

[6] In a later book-length study, Turner (1978) was one of the first anthropologists to explore the broader significance of pilgrimage as a general phenomenon. But even this work primarily emphasises the presumed psychological effects upon the individual pilgrims connected to and changed by “the center out there” and their relation to local societies, and pays less attention to their altered sense of “home” when they return to their society of origin. Roff (1985: 86) offers a similar critique.

* Part One: Doctrines of travel

** Chapter Two: The obligation to migrate: the doctrine of hijra in Islamic law

Muhammad Khalid Masud

*** Introduction

On 22 March 1987 three young men approached Allama Ihsan Ilahi Zaheer.[9] They wanted to discuss with him the meaning of a Qur’anic verse about hijra,[10] and argued that the situation in Pakistan was worsening. They specifically argued that the Family Laws Ordinance governed the personal lives of Muslims instead of Shari‘a law,[11] so that the political environment was not conducive to the practice and propagation of Islam. The youths argued that under these circumstances, according to the Qur’anic verse, there were only two options available to Pakistani Muslims: either to declare Pakistan dar al-harb (an enemy territory) and wage jihad against it until it is restored to dar al-Islam; or to leave Pakistan altogether.

The Allama disagreed with them and explained that they held an extremist view. He emphatically refuted their arguments, but the young men kept arguing and departed unsatisfied. The Allama was very much perturbed and expressed his anxiety over rising extremism among the Muslim youth (Najmi 1987: a). On 23 March, a day later, a bomb exploded at a public meeting which Allama Zaheer was addressing. He received serious injuries and later died of his wounds.

There may not be any connection between the bomb explosion and the three youths, and their extremist views are not typical of Pakistani youth. None the less, I cite the incidents to illustrate that some Muslim youth, albeit extremists, still believe that hijra (the physical movement away from unbelief) is an essential expression of Muslim identity. Similar trends are apparent in other parts of the Muslim world: for example, Jama‘at al-Muslimin (The League of Muslims) in Egypt were nicknamed by their opponents Jama‘at al-Takfir wa-l-Hijra (The Society of Excommunication and Emigration) because of their emphasis on hijra (Kepel 1985: 77).

This chapter traces how the doctrine of hijra took shape. Any generalisation about the historical development of this doctrine is difficult because no systematic studies of it exist. Moreover, although references to hijra are quite frequent in the fatawa literature, which consists of responses to specific questions, they are scattered throughout the regular books of Islamic law rather than grouped together under the heading of emigration.

In view of these difficulties I propose first to present an account of context, describing the particular events in the history of Islam which gave rise to thinking on hijra. Next, I deal with doctrinal foundations - i.e. the written texts on which doctrinal discussions about hijra are based. Finally, I consider challenges and responses to the doctrine occasioned by historical developments that have encouraged the doctrine’s reinterpretation or reconstruction by Muslim jurists. These developments include the revolt of the Khawarij (AD 657),[12] the occupation by non-Muslims of Muslim lands and western colonialism, Muslim migration to non-Muslim countries, and the rise of Muslim nation-states.

After an analysis of the period of civil wars (the first fitna, AD 656–61, and the second fitna, AD 683–92), this chapter discusses developments in Indo-Pakistani and Nigerian Muslim societies, two Muslim societies with which the present writer has been professionally concerned. Moreover, this choice provides an opportunity to study the formulation and development of the doctrine of hijra in two different legal contexts and interpretive frameworks — Hanafi in the case of Pakistan and Maliki in the case of Nigeria.

*** Context

Hijra, an Arabic term which literally means “to abandon”, “to break ties with someone” (such as a bond of kinship or other personal association), or “to migrate” (Watt 1971: 366), refers primarily to the Prophet Muhammad’s migration from Mecca to Medina in AD 622. It is also discussed with reference to the migration of a group of Muslims from Mecca to Abyssinia in AD 615–22. Although the hijra to Abyssinia was voluntary and limited in scope, the hijra to Medina was obligatory and involved almost the entire Muslim community. No Muslim was supposed to stay behind in Mecca. Exemption was allowed only to the “weak” — women, children, and the sick — and those who could not afford to migrate. Staying behind in Mecca was also allowed after the pact of Hudaybiyya (AD 628–30). While there was no pact between the king of Abyssinia and Muslims, the migration to Medina was preceded by pacts (bay‘at al-harb/hijra, the pact of war or emigration) between the Prophet and the people of Medina who swore allegiance to protect Muslims and to wage jihad against their enemies (Ibn Hisham 1963: II, 303).

A significant fact in the events of the hijra to Abyssinia in AD 615–22 was that women’s participation in migration was equally prominent. The two group migrations to Abyssinia were family migrations, including both women and children. The migration to Medina was preceded by two pacts concluded in AD 620 and AD 621 between Muslims of Mecca and Medina. As already mentioned, the second pact was called “the pact of war”. The first was named “the pact of women” not only because women took part in this pact, but also because the first person to swear allegiance to this pact was a woman named ‘Afra’ (Ibn Hisham 1963: II, 293). The Qur’an refers to this pact in 60: 12 (sura 60, verse 12).[13]

The second pact was a pact of protection and war and included among its signatories Umm ‘Amara and Umm Mani‘, who participated in it along with men. There are stories of families moving together during the actual migration from Mecca to Medina (Ibn Hisham 1963: II, 319–20). The first person to migrate was Abu Salma, whom the Meccans did not allow to migrate with his family. His wife later travelled alone to join him. The second migrant, ‘Amir b. Rabi‘a, succeeded in migrating to Medina along with his wife (Ibn Hisham 1963: II, 321–4).

After the migration all ties, including “blood” relationships, were broken with both non-Muslims and Muslims who refused to migrate. Instead, a new bond of brotherhood (mu’akhat) between muhajirs (migrants) and ansars (inhabitants of Medina — generally supporters or local hosts) was established, which entitled them even to inherit from one another (al-Tabari 1958: 199). Hijra thus meant to abandon one’s property and relations in order to support the nascent community of Muslims in Medina. Refusal to perform hijra meant to weaken the Muslim cause and to lend support (wala’ or muwalat) to their enemies. Hence in early Islam, non-migrants were not

allowed to inherit from Muslims in Medina, not were they entitled to any share in the spoils of war (ghanima). The right of inheritance between blood relations among Muslims was later restored, although non-Muslim relations were still disallowed from inheritance (Qur’an, 8: 75).

*** Doctrinal foundations

The textual sources, the Qur’an and hadith (pl. ahadith; texts relating to the sayings of the Prophet), abound with references to the events of the original hijra and to injunctions given in its context.

The word hijra has been used in the Qur’an to mean “to reject” (23: 69), “to shun” (74: 5), “to depart” (19: 46) and “to banish” (4: 34). The shared meaning in all these usages may be deduced to be a distancing — physical or otherwise — usually from evil and disbelief. The derivative forms hajara (59: 9; 2: 218; 3: 195) and muhajir (9: 100, 117; 33: 6; 59: 8; 60:10; 8: 72) mean “to migrate”. Most verses employing the derivative form hajaru (“they migrated”) are often paired with jahadu (“they waged war”) and thus imply a close association of hijra with jihad.

It is not possible here to survey the implications of all the Qur’anic passages. For the purpose of our discussion we refer only to the two verses most often cited in debates concerning hijra:

Those who believed and left their homes [hajaru] and strove [jahadu] with their wealth and their lives for the cause of Allah, and those who took them in and helped them [nasaru], these are protecting friends of one another. And those who believed but did not leave their homes, you have no bond [walaya] with them till they leave their homes, but, if they seek help from you in the matter of religion, then it is your duty to help them except against a people with whom you have a treaty [mithaq].

(Qur’an, 8: 72)

Lo! as for those whom the angels take [in death] while they wrong [zalimi] themselves, the angels will ask: “In what were ye engaged?” They will say: “We were oppressed [mustad‘afin] in the land”. [The angels] will say: “Was not Allah’s earth spacious that you could have migrated therein?” As for such, their habitation will be hell, an evil journey’s end. Except the feeble [mustad‘afin] among men, and the women and the children, who are unable to devise a plan and are not shown a way. As

for such, it may be that Allah will pardon them — Who so migrateth for the cause of Allah will find much refuge and abundance [of bounties] in the earth.

(Qur’an, 4: 97–100)

From the Qur’anic texts the following significant points about hijra can be inferred: (1) It was an obligation of physical movement towards self-definition in the nascent Muslim society. Refusal to migrate meant exclusion from the society; (2) hijra was closely associated with jihad; and (3) hijra established a bond of relationship among Muslims, particularly with the ansar.

Among several hadiths on the subject of hijra, the following offers parallels to the famous five pillars of Islam:

I convey the following five commandments given me by God: attention (sam‘), obedience (ta‘a), migration (hijra), struggle (jihad), and organisation (jama‘a).

(Ibn Hanbal, n.d.: 130)

There are numerous hadiths prescribing hijra as an obligation. However, the hadith literature adds a new dimension to the Qur’anic injunction. It also refers to situations where hijra is no longer obligatory. For example, the Prophet is reported to have said: la hijrata ba‘d al-fathi, “no migration was required after the conquest” (al-Bukhari 1971: 190). None the less, there are hadith texts according to which hijra continues to be an obligation (Abu Da’ud 1933: 234).

Abu Sulayman Hamid b. Muhammad Khattabi al-Busti (AD 931-96/8), a scholar of hadith, reconciled this difference of opinion and argued that hijra was actually meant to support and strengthen dar al-Islam in its nascent days. After the conquests dar al-Islam was so strong and established that migration was no longer required. The hijra would be required again only and whenever the conditions so demanded (Ibn Hajar 1959: VI, 378).

Ibn Khaldun (AD 1332–1406) explained these texts by saying that hijra meant migration to join the Prophet Muhammad. Hijra might have continued to be an obligation after the conquest of Mecca, but it was definitely not required after the death of the Prophet (Ibn Khaldun 1958: I, 256).

Abu’l-Fadl Ahmad b. ‘Ali Ibn Hajar [al-‘Asqalani] (d. AD 1449), a later hadith scholar, analysed in detail this debate and showed that a number of the companions of the Prophet, including Ibn ‘Abbas (d. AD 687), and his contemporaries Ta’us, Mujashi‘, Ibn Jurayj, ‘Ata’ and ‘A’isha, perceived hijra only as migration from Mecca to Medina. Hence, after Mecca was conquered no hijra was required (Ibn Hajar 1959: VI, 378).

Thus, even as early as the formative period, we see a refinement in the formulation of the doctrine. During AD 622–8, the hijra from Mecca to Medina was obligatory in terms of expressing one’s Muslim identity. Migration also meant weakening Mecca and strengthening Medina. Only persons unable to migrate (al-mustad‘afin) were allowed to stay in Mecca. The situation changed in AD 630 when Mecca joined dar al-Islam. After AD 630, the statement that hijra was no longer required from Mecca raised the question of whether hijra only meant migration from Mecca to Medina. Could it be generalised to state that migration from the outside to dar al-Islam was obligatory?

The answer is not simple, because the hijra to Abyssinia was not

to dar al-Islam. The Hudaybiyya pact allowed Muslims to stay in Mecca, and the Prophet did not require the bedouin to migrate to Medina. A general rule was therefore derived that even after the conquest of Mecca, such situations as the following could make hijra relevant again: (1) dar al-Islam turns into dar al-kufr; or (2) a resident of a territory outside dar al-Islam embraces Islam.

Is hijra obligatory in these situations? An answer to this question also involves other issues, such as (i) how dar al-Islam turns into dar al’kufr, and (ii) the legal status of a Muslim who does not migrate. Indeed, these and other questions helped refine the doctrine. It should be emphasised that even the early textual formulations of doctrine are closely related to the actual political and social contexts. Subsequent interpretations similarly demonstrate a dynamic interaction between text and social, economic, and political conditions.

*** Challenges and responses

**** The revolt of the Khawarij

Civil wars among Muslims erupted quite early during the period of the first caliphs (AD 632–61). The rebels defined their position within the Islamic framework and hence had to justify their war with opposing Muslim groups — most often the ruling groups in the centre — in terms of jihad. It was therefore necessary to strengthen their camp by asking their followers to migrate from enemy territories.

Foremost among these dissenters were the Khawarij,[14] who considered the commission of major sins as kufr (unbelief). They rebelled against the Caliph ‘Ali and subsequently against the Umayyids (AD 661–750). Their support was largely among the nomads. The Khawarij were probably the first Muslim group to define political dissent in theological terms, thus generating scholarly controversies on different issues.

In order to justify their jihad and hijra, the Khawarij raised the question of the original status of territory. According to them, all territories were dar al-kufr until they were brought into the fold of Islam. A territory could turn again into dar al-kufr if its rulers denied the sovereignty of Allah, or committed a major sin, whereby they became kafirs. In these circumstances, hijra from such a territory and jihad against it become obligatory. The Khawarij, Azariqa,[15] and Sufriyya[16] all held these general views. Yet, whereas most of the Khawarij declared their opponents mushriks (polytheists), the Ibadiyya[17] adopted a more moderate view. They

believed that their enemies among the people who prayed in the same direction were kafirs, and that marriage and inheritance with them were allowed.

The Ibadiyya did not term all the territories outside their own camps as dar al-kufr, but the camp of the sultan was certainly so. According to the Ibadiyya, inability to migrate was not an excuse but a condition that one should strive to remove. The ‘Awniyya[18] explained that when the ruler committed kufr, his subjects also became unbelievers. They believed that hijra and jihad were interrelated, and broke ties with those who migrated in order to avoid jihad (al-Ash‘ari 1950: I, 162–79; al-Shahristani 1899: I, 170–84).

**** The responses

The views of the Mu‘tazila oscillated between the positions of the Khawarij and the Ibadiyya. Jubba’i (d. AD 916), a Mu‘tazili leader, expounded the view that as long as it was possible to stay in a territory without being forced to agree or to commit acts of unbelief, the territory was dar al-iman (the land of faith). However, according to him, this condition did not prevail in Baghdad (al-Ash‘ari 1950: II, 137).

The Shi‘a, who opposed the Umayyid and ‘Abbasid (AD 750–1258) regimes, did not take the extreme position of the Khawarij. Their position varied according to circumstances. Some Shi‘a took a middle position and defined the territory as dar al-hudna (the land of peace), from which migration was not obligatory. Others, particularly the Zaydis, called it dar al-kufr (the land of unbelief) (al-Ash‘ari 1950: II, 137).

The majority of the Muslims who favoured the status quo disagreed with these extreme views of kufr and hijra. They took a moderate position and referred to a hadith which explained the various levels of iman. The hadith recommended that one should strive to remove evil with hand or tongue depending upon his ability. If one is unable to do either, one should at least distance oneself from evil in one’s heart. This, however, was the weakest level of iman (Muslim 1954: I, 69). The majority view was that the higher levels called for jihad and that jihad was a fard kifaya (a collective duty) not required of each and every Muslim, and not to be undertaken individually. Hijra, according to this majority view, was a jihad-related obligation. The only hijra that could be performed individually was withdrawal in the heart. Such interiorisation of hijra in the esoteric sense was popularised by the Sufis.

Abu’l-Qasim al-Qushayri (d. AD 1074) defined hijra as “extracting oneself from the desires of the soul to the shade of His

closeness” (al-Qushayri n.d.: I, 51). He explained that complete hijra meant “abandoning the soul by not attending to its desires and then migrating from the land of rights to the land of submission to God’s will” (al-Qushayri n.d.: II, 335).

The Sufi commentators of the Qur’an usually explain that the obligation of physical migration was repealed. The only hijra required was spiritual. Maybudi (d. AD 1125) pointed out that there were three types of hijra: (1) that of ahl al-dunya, migration of “people of the world” for the purpose of trade; (2) that of the zahidin, the ascetics’ migration towards the hereafter by performing all religious rituals and spiritual contemplations; and (3) that of the ‘arifin, the mystics’ migration from the veils of self to the heart, and from the heart to the soul, and, ultimately, to the Beloved (Maybudi AH 1338: II, 662). The Sufi Najm al-Din Kubra (d. AD 1225) defined hijra as migration from the land of human beings to the presence of Allah (al-Bursawi 1911: II, 272).

The Sufi interiorisation of the doctrine was a reaction to adverse social and political conditions. They faced a stark choice: either support an unjust ruling group or, like the

Khawarij, revolt against it. In these circumstances, the Sufis took the position of withdrawal. The jurists also did not collectively adopt the extreme position. They perceived that the supremacy of the shari‘a could be maintained only if there was less interference by the rulers in the interpretation of law. They were not in favour of the shari‘a being interpreted by governmental institutions.

This view of law developing independently of government started to take shape during the Umayyid period and crystallised during the early ‘Abbasid period when attempts were made by the caliphs to take the right of legislation into their own hands (Schacht 1966: 55). The jurists, however, did not want to challenge the political supremacy of the rulers because that would create disunity and political chaos. Hence, they generally supported the political status quo and favoured allegiance to rulers as long as they did not interfere in their right to interpret the shari‘a.

Jurists therefore defined dar al-kufr as a vague and amorphous category. Usually all the territories bordering dar al-Islam were dar al-kufr, against which the rulers were urged to wage jihad at least once a year (Khalil 1916: 73). Such a definition, however, did not operate during the Prophet’s period.

The bedouin around Medina and Mecca were never obliged to migrate to Medina. Instead of the bay‘at al-hijra (pledge to migrate), they pledged to join jihad against the unbelievers. The Muslim population in this early period was divided into three categories: muhajir, ansar and a‘rab (bedouin) (al-Tabari 1958: 14–78).

In those days the a‘rab and muhajir were opposite terms. The a‘rab were allowed a share in the spoils of war but not in other revenues. Donner (1981: 79) explains that early Muslims adopted hijra as a policy of “sedentarisation” in order to gain dominance by subordinating nomadic groups to a sedentary elite. It is difficult to say if there was a uniform policy for all the nomads, but we do know that it was during the Umayyid period, largely because the Khawarij were supported by nomads, that nomadism was considered the equivalent of returning to the pre-Islamic order. In view of the civil wars during this period, settlement was naturally stressed: the nomads, not under direct control of the centre, could provide refuge and protection to rebels. This Umayyid policy differed from preceding and later policies towards nomadism. [19]

Muhammad Idris al-Shafi‘i (d. AD 820), the founder of the Shafi‘i school of law, particularly referred to the case of the bedouin to argue that hijra was not obligatory for all because the Prophet permitted the bedouin not to migrate if they did not so desire. Shafi‘i argued further that hijra became an obligation only after the declaration of

jihad, and then only upon those who had the ability to do so (al-Shafi‘i 1903: IV, 84). According to al-Shafi‘i, therefore, a Muslim could stay in dar al-kufr, even in dar al-harb, as long as he was free to practise his religion.

**** The Maliki formulation and jihadist challenge

The majority of the Maliki jurists agreed with Shafi‘i that hijra was not an obligation after Mecca was conquered. Al-Maziri (d. AD 1141) argued that staying behind in dar al-kufr with a legitimate excuse generally, or for the propagation of Islam specifically, was allowed and did not affect the rights of a Muslim. Even the judgements by a qadi appointed by a non-Muslim were valid and executable (Wansharisi 1981: I, 100). Abu’l Hasan al-Manufi al-Maliki (d. AD 1531) similarly held that the hijra was not required after Hudaybiyya (al-Maliki n.d.: II, 5). Ibn al-‘Arabi (d. AD 1148) argued for the continuity of obligation but subjected hijra to a detailed analysis none the less. He argued that there were six situations of migration. Hijra was obligatory from territories of unbelief, heresy and injustice, or where unlawfulness prevails. Hijra was allowed but not obligatory from lands of physical persecution, lands of disease, and lands of financial insecurity (Ibn al-‘Arabi 1972: I, 486).

The Jihadist movement in the eighteenth century criticised the popular definition of dar al-Islam as a country ruled by Muslims. Shehu ‘Uthman dan Fodio (AD 1754–1817) was the foremost among

those leaders who developed a detailed restatement of this doctrine. His formulation is discussed elsewhere in detail (Masud 1986), but can be summarised as it relates to the present argument.

Shehu’s restatement of the doctrine of hijra was prompted by the actual historical circumstances in which he was forced to fight against the syncretism, injustice, and corruption of the Hebe Muslim rulers. He had to justify his jihad and migration against the criticism of Muslim jurists who supported the ruling regimes and who challenged Shehu’s jihad against Muslim rulers.

Shehu’s restatement rested on his argument from the original tradition of the Qur’an, hadith, and Maliki fiqh. The main points of his doctrine were the continuity of the obligation of migration, the close relationship of jihad with hijra, and the need for a redefinition of dar al-Islam.

Shehu agreed with the Khawarij on most questions of hijra, but he disagreed with their considering the commission of a major sin as kufr. He did not, however, accept the rulers' nominal adherence to Islam. In fact, he defined kufr as, first, their observance of pagan practices, and, second, their support of pagans against Muslims. Shehu succeeded in establishing a dar al-Islam in Nigeria that continued to flourish until the British occupied it in 1903.

Shehu's formulation had a far-reaching impact on other jihadist movements in West Africa. For example, his doctrine was cited as authority by the amir of Massina in his debate with Shaykh 'Umar al-Futi in 1855–64 (Willis 1979: 179). His doctrine also influenced the formulation of doctrines by Amir 'Abd al-Qadir in Algeria, Ma' al-'Aynayn al-Qalqami in Mauritania and Muhammad 'Abdullah Hasan in Somalia (Martin 1976: 33), and it continued to influence the Nigerian response to British hegemony.

**** Non-Muslim occupation and colonial rule

The questions of dar al-Islam and hijra arose again after the British occupation of India and Nigeria. Attahiru, the last sultan of the Sokoto Caliphate, resorted to Shehu's formulation of hijra when faced with the British invasion from 1900 onward. When Kano was also taken, Attahiru chose to perform hijra in order to rally his forces against the British. He called his followers to hijra and, in the words of a British journalist:

each time he passed through the people were told to follow him to Mecca, otherwise they would become Kaffiri and as a result half of the population of every town tied up their bundles and joined in his train.

(cited in Clarke 1982: 195)

Attahiru finally encamped at Burmi where he and his followers valiantly fought their battle against the British.

Attahiru was killed and thus the British conquest of Nigeria was complete by 1903. After Attahiru's death, Maliki scholars returned to the formulation that hijra was not required. They accepted British rule, arguing that so long as Muslims had freedom to practise their religious duties, the land continued to be dar al-Islam (Savi 1971: II, 291).

The situation was different in India, where the Hanafi formulation prevailed. The Hanafi formulation of the doctrine of hijra differs from the Maliki formulation on two points. First, Hanafis argue that it is not correct to claim that succession among migrants to Medina in AD 622 was practised on the basis of hijra, nor that this Qur'anic injunction was abrogated later in order to restore succession on the basis of "blood" affinity. They maintain that succession was always based on "blood" relationships. Migration was important only to the extent that those "blood" relations who did not migrate did not qualify for succession. Brotherhood between muhajirs and ansars had economic advantages, but it was not the only ground for inheritance (Jassas 1916: II, 241).

Second, Hanafis stress the territorial factor of dar al-Islam. Their disagreement with claims of succession on the basis of migration is in fact also based on consideration of territory. A Muslim who did not migrate to dar al-Islam was disallowed from inheriting property there because it would mean transfer of property from dar al-Islam to dar al-harb. Similarly, even the spoils of war were not granted legal title until they were actually transferred to dar al-Islam.

Thus Hanafi doctrine is largely based on ideas of territory. A person is treated according to the territory where he is ('Alamgiri 1932: III, 423). Consequently, a Muslim who does not migrate from dar al-harb, although a Muslim, is to be governed by the rules of dar al-harb. This is why the Hanafis allow transactions by Muslims in dar al-harb that are not allowed in dar al-Islam.

Due to these considerations, according to Hanafis, dar al-Islam changes into dar al-harb if the following three conditions obtain: (1) the laws of disbelievers gain supremacy and no law of Islam can be executed; (2) the Muslim and non-Muslim populations are no longer governed by the original pacts that they enjoyed before the non-Muslim occupation; and (3) the land in question is adjacent to the territory of dar al-harb such that there is no land of Islam between them ('Alamgiri 1932: III, 415). Analysing these views in detail, Wahba al-Zuhayli, a modern Muslim jurist, concludes that Hanafis believe in the application of law on a territorial basis, while Malikis and others apply it on a personal basis (al-Zuhayli 1962[?]: 175).

Shah 'Abd al-'Aziz (1904: 16–17) was asked frequently whether British India was dar al-harb. He said that it was, but disallowed all of the implications of his declaration. India was dar al-harb because the laws of the shari'a were not supreme. He did not, however, allow the usury transactions that Hanafis allow in dar al-harb. He dismissed as political expediences the freedom allowed by the British to observe Friday services, religious feasts, and the calls to prayer, and the permission to slaughter cows and observe other personal laws. When Shah 'Abd al-'Aziz was asked why he did not call for hijra

from dar al-harb, he replied that the hijra required, as a necessary condition, possession of the means to migrate; it was allowed only if the means were available

(al-Qannuji 1985: 238). Yet Sayyid Ahmad Barelwi organised hijra and jihad to restore India’s status of dar al-Islam. According to William Hunter, the 1857 Muslim revolt against the British was a continuation of Sayyid Ahmad’s movement of hijra (Hunter 1964: 3).

However, the Hanafi majority view has been that if Friday and the religious holidays can be observed, the land is dar al-Islam. The non-Muslim rulers can appoint Muslim governors and judges whose orders would be Islamically valid (Isma’il 1985: 231). Other scholars — such as Karamat ‘Ali Jawnpuri, Sayyid Ahmad Khan, and Nadhir Husayn Muhaddith al-Dihlawi — similarly termed British India dar al-Islam.

An important event was the 1920 hijra from India to Afghanistan after the declaration of India as dar al-harb. From a recent analysis of this movement (Qureshi 1979), it is clear that the movement did not possess a traditional doctrinal basis. It was based on the fatawa of Mawlana ‘Abd al-Bari Farangi Mahli (1828) and Shah ‘Abd al-‘Aziz (1824). As I have explained. Shah ‘Abd al-‘Aziz did not call for hijra, and ‘Abd al-Bari maintained that he did not consider hijra mandatory. Scholars belonging to the Deoband and Barelwi schools — such as Ashraf ‘Ali Thanawi, ‘Abdur Ra‘uf Danapuri, Ahmad Riza Khan Barelwi, and Pir Mihr ‘Ali Shah — advocated the refrain from hijra (Mahmud 1986: 72, 258–69). It was mainly Abu’l Kalam Azad’s writings that provided the theoretical and intellectual basis for this movement (Azad n.d.: 31–2). His was in fact a restatement of the doctrine similar to that made by Shehu ‘Uthman dan Fodio.

Abu’l Kalam Azad was joined by Muhammad and Shawkat ‘Ali, leaders of the Khilafat movement, and many other public leaders. Thousands of Muslims, in fact, responded to the call for hijra and many thousands actually began their journey of migration to Afghanistan. Qureshi points out that the Afghani elite also encouraged the movement but only for their own political ends (Qureshi 1979: 45). The result proved disastrous for Muslims. Afghanistan did not prove to be dar al-Islam for these muhajirin who had volunteered to move there after disposing of all their possessions. Hundreds died on the way to and back from Afghanistan; others returned to India destitute and frustrated.

It is clear that the hijra movement of 1920 was not supported by the established ‘ulama’, who had traditional training. The movement, on the contrary, was led and supported by scholars who were not traditionally trained. In fact, they

were scholars like Abu’l Kalam Azad whom the traditional men of learning never recognised as religious scholars (Mushir 1974: 25). Other scholars in the movement came from the Ahl al-Hadith school, which refused adherence to the traditional four Muslim legal schools. Further, the leaders of the movement came from the western-educated class, such as the Ali brothers. It is important to note that whereas the traditionally trained ‘ulama’, whether in Nigeria, India, Pakistan, or Indonesia (Van Dijk 1981), generally favoured the status quo, self-trained scholars led the new Islamic political movements.

It seems that the people who raised the question of dar al-harb and asked opinions of scholars like Shah ‘Abd al-‘Aziz were probably interested in this issue in order to avail themselves of the exemptions from the application of Islamic law that Hanafis allow to Muslims in dar al-harb. This is probably why the questions referred mainly to money transactions based on riba (usury). Muslims were discouraged from military jihad against the British by the military superiority of the colonial powers, Muslim defeat at their hands in Plessey (1757) and Burmi (1903), and the subsequent ruthless repression. The only form of jihad available to them was tark mawalat (withdrawal or non-cooperation). Jihad and hijra both required means which the Muslims lacked. Moreover, the general British policy of non-interference in religious matters suited the conception of dar al-Islam of traditional ‘ulama’.

During the late nineteenth and twentieth century, the spread of education, growth of political consciousness, and increase in the means of communication made it easier for Muslim religious leaders to learn more about political conditions in developed countries. They compared these conditions with the restrictions prevalent in colonised territories, so that dissatisfaction grew with the status quo. At the same time, leadership came not from traditional scholars and landowners, but from Muslims who had been educated in the west and from reformers.

Traditional scholars and landowners favoured the status quo, however, and the new leadership therefore looked to the masses for support against the British. The most powerful medium against the

colonial power was religion, which could eliminate fear and inspire commitment. Religion was not the only factor that could unite the masses against the colonial rulers, but it was the weakest point of the colonial system. The new leadership, although not deeply entrenched in the traditional religious sciences, revived and invoked such religious issues as hijra as a rallying point for political advantage.

**** Hijra to non-Muslim countries

A new dimension of hijra emerged during the nineteenth century. For reasons of higher education, training, and employment, Muslims travelled to non-Muslim lands and stayed there for longer periods. In some cases they migrated in order to settle. This was altogether a new type of hijra; its motives and objectives were different.

As mentioned earlier, scholars like Ibn al-‘Arabi permitted hijra from a land of disease and financial insecurity to a better place (Ibn al-‘Arabi 1972: I, 486), and based their argument on Qur’anic verse (4: 100). Others allowed hijra to non-Muslim lands for the purpose of propagation of Islam. They based their argument on the legal view that Muslims must remain in dar al-kufr in order to propagate its reconversion. An illustration is the discussion contained in a recent treatise, Hukm al-iqama bi-bilad kufr wa-bayan wujubiha fi-ba‘d al-ahwal [Legal View of Staying in the Lands of Unbelief and the Explanation of Why It Has Been Obligatory in Certain Circumstances], relating the question of whether residence in non-Muslim countries can be said to be obligatory.[20] The author states that in 1985 some Algerian students met him in Mecca and asked whether staying in European countries and America was allowed. The students claimed that the position of scholars was not clear, and they particularly referred to a recent fatwa which prohibited such a stay (‘Abd al-‘Aziz al-Siddiq 1985: 6).

The author of the treatise discusses the problem at length and concludes that remaining in Europe and America for the purposes of education and employment is not only allowed but is often obligatory. His main arguments include the following: education and training in modern science and technology are obligatory for the progress of Muslim societies, since otherwise they would remain dependent on developed countries (‘Abd al-‘Aziz al-Siddiq 1985: 12–13); the Qur’an and hadith enjoin Muslims to seek knowledge and livelihood all over the globe; and the reason for migration from dar al-kufr and for the prohibition from entering it, as given in Islamic law, is the apprehension that the person, property, and/or

religion of a Muslim are not safe in these territories, yet today there is no such fear. Indeed, the conditions for the practice and propagation of one’s religion are better in Europe and America than in most Muslim countries (‘Abd al-‘Aziz al-Siddiq 1985: 30, 45–50). He argues, finally, that western countries which have made pacts and treaties with Muslim ones are no longer dar al-kufr (‘Abd al-‘Aziz al-Siddiq 1985: 51). The most distinguished scholars of Islamic law in the Middle East — such as Muhammad b. Ahmad Abu Zahra (1898–1974), ‘Abd al-Qadir ‘Awda (d. AD 1954), and Wahba al-Zuhayli — have offered similar interpretations of the doctrine of hijra (Abu Zahra n.d.: 55; ‘Awda 1959: I, 275; al-Zuhayli 1962[?]: 149).

**** Nation states

Muslims re-emerged after independence from colonial rule divided into a number of nation-states. During the colonial period Muslim romanticism visualised the Muslim world as a single, monolithic and sovereign polity. Now there are a large number of Muslim communities without sovereignty. Are they part of the Muslim world? Should the Muslim world regard them as distant enclaves in foreign lands and therefore help them? Or should they be considered permanently situated under non-Muslim jurisdiction?

What should these Muslim communities do? Should they migrate to Muslim countries? Should they continue struggling to achieve liberation and sovereignty? Should their objectives be the achievement of civil and cultural rights within a non-Muslim polity?

It is clear that the emerging Muslim world is not the dar al-Islam of medieval times. It consists of nation-states looking after their own national interests. Unlike the situation that prevailed in the medieval dar al-Islam, a Muslim cannot freely travel, migrate, or settle in any Muslim country today. Some of these countries are secular; others have reformed religious and personal laws along western lines. The non-Muslim populations in these Muslim countries have been participating equally in the struggle for freedom, independence, and progress, and thus are not conquered people to be forced to accept the status of a protected minority (dhimmis). The doctrine of hijra consequently faces new challenges.

In early Islamic history, the formulation of the doctrines of hijra was interconnected with the definition of dar al-Islam and kufr. However, the issues posed by the framing of these doctrines varied. In the early period, the question was: from where to where must one migrate? Although this question had a different meaning for dissident political groups, it continued to be asked during the

medieval period about Muslims not living in dar al-Islam. For Muslims living within dar al-Islam the question was: from where must Muslims not migrate? Whereas in the early period dar al-kufr defined hijra, in the medieval period hijra defined dar al-Islam. Any movement of migration from a certain territory meant that it was no longer considered dar al-Islam - at least, not by the migrants.

The question of hijra became prominent again during the thirteenth century when Christians in the west and Tartars in the east occupied Muslim lands. The question was now posed differently: must one migrate from a territory that once was dar al-Islam? Categories between dar al-Islam and dar al-kufr were developed to answer the question, and these

categories proved to be useful during the colonial period between the eighteenth and nineteenth centuries.

With the rise of nation-states and a secular world-view, the definition of dar al-Islam has become increasingly problematic. In this context, the definition of hijra in terms of movement from dar al-kufr becomes irrelevant. One must ask not only from where must one migrate, but also to where? Several modern scholars (e.g. al-Zuhayli 1962: 159; Abu Zahra n.d.: 55) seem to have redefined dar al-Islam and searched for new categories of territory (dar) from the point of view of hijra.

Dar al-Islam and related dar categories are now being defined more frequently with reference to the question: from where does one not need to migrate? Answers to this question have produced categories such as dar al-'ahd (the land of pact), dar al-sulh (the land of truce), and dar al-aman (the land of peace), in which a Muslim's freedom to practise his religion is protected by covenant. It is significant that the frame of reference for this apparently new interpretation is still the early tradition of hijra. This particular movement of hijra - migration to a non-Muslim land — is alluded to as the Abyssinian model, referring to the earliest hijra by Muslims to Abyssinia, a Christian country. It is also justified with reference to the Hudaybiyya model, whereby Muslims were not required to migrate from Mecca — at that time still a non-Muslim land — because of a pact between it and Medina. These interpretations seem appropriate to the world of nation-states because citizens are protected by pacts between them.

*** Conclusion

This discussion is intended to be exploratory rather than definitive, but several points emerge. First, it should be noted that hijra,

which appears as one of the essential obligations in early Islam and is often discussed at length in hadith, tafsir, fiqh, fatawa, and Sufi literature, did not earn sufficient prominence in the later classification of fiqh or kalam subjects to deserve treatment as a subject in itself.

Second there is a distinction, although often blurred, between the Hanafi and other schools in the debates about hijra. While the Hanafis tend to define the status of a person living in dar al-harb and the transformation of dar al-Islam into dar al-harb in terms of territory, the other legal schools do not. It can be argued that among the Hanafis there

was a trend towards a territorial definition of law, in contradistinction to others who adhered to a personal definition. Other legal schools considered a Muslim living in dar al-harb to be still subject to Islamic law, but, in contrast, the Hanafis were not in favour of applying Islamic law to Muslims in enemy territories. This distinction would have developed had it not been for the exemption from the application of certain Islamic laws to non-Muslims living in dar al-Islam - an exception that probably grew out of the principle of freedom of religion.

Third, the formulation of the doctrine at various historical junctures shows the discursive nature of intellectual arguments in the Muslim tradition. Jurists constantly go back to texts — often the same ones — interpreting and reinterpreting them in order to justify the opinions shaped by earlier social, economic, and political conditions. The extreme views, which in the case of hijra invariably rely on Khawarij interpretations, are taken by political dissenters.

Finally, it should be noted that although one might expect a written text as a frame of reference to prove restrictive on subsequent interpretations, the doctrine of hijra has, on the contrary, been quite adaptable to varying political contexts. The same texts have been interpreted to justify widely different views.

The reason for this flexibility lies perhaps in the acceptability of these interpretations more than in the interpretability of the doctrine itself. There is something which we may call a “semantics of expectation” on the part of society. Words acquire new meanings according to these expectations. The shifts of meaning of hijra — from movement itself to settlement, from physical movement to spiritual and mental withdrawal, and from movement to Muslim territory to residence in Western countries for the purpose of propagating Islam — are examples of this semantics of expectation.

The calls for the establishment of dar al-Islam, sometimes without call for physical hijra, have curiously been made not by the traditional scholars, but by a new type of Muslim intellectual,

self-trained and lacking formal education in the traditional schools of jurisprudence. These new intellectuals have either graduated from western-style schools and universities or have been intellectually nourished on western literature. Because of their modern world views, these intellectuals are more acceptable to urban, educated Muslims than their traditional counterparts, who still attract a primarily rural and “superstitious” clientele. These new intellectuals, for the simple reason that they are not hindered by the complexities of traditional legal thought, have the freedom of selecting more eclectically from tradition and justifying their views directly from the Qur’an and hadith. They often earn instant popularity because of reference to the “sources”, but, since their interpretations do not form a continuity with tradition, their impact is often partial and ephemeral. The new

intellectuals are therefore continually compelled to search for dramatic, and often extremist, solutions.

[9] Allama Ihsan Ilahi Zaheer (1940–87), born at Sialkot in a religious family, pursued traditional religious studies at Gujranwala and graduated from Jami‘a Salafiyya in Faisalabad in 1960. After completing his studies at Medina University, he returned to Pakistan where he obtained MA degrees in Urdu, Persian, History, and Philosophy from Punjab University and an LL B from Karachi University. From 1966 he was khatib of Jami‘a Masjid Ahl al-Hadith in Lahore. He edited various religious journals, published his own monthly magazine, Tarjuman Ahl al-Hadith, and wrote about fifteen books, most of them in Arabic. Towards the end of his life he became active in politics. He was the Nazim-i-A‘la of Jam‘iyyat Ahl al-Hadith whose public meeting he was addressing on 23 March 1987, when a bomb exploded and seriously wounded him. He died on 30 March at the Saudi Military Hospital in Riyadh (Islamic Studies 1987: 230).

[10] The news story does not specify the Qur’anic verse. It only states that the young men referred to the verse in sura 4 that bade Prophet Muhammad to migrate. They might be referring to verse 97, which is mentioned in my main discussion.

[11] Reforms such as the registration of marriages and restrictions on polygamy were introduced by the Muslim Family Laws Ordinance of 1962, despite severe protests by the ‘ulama’.

[12] Dates in this chapter have been adopted from Hodgson (1974).

[13] Numbers of the verses of the Qur’an as well as the English translation are from Pickthall (1953).

[14] Khawarij: The earliest sect in Islam which rebelled against ‘Ali (AD 656–61) because of his compromise with the Umayyids after the Battle of Siffin (AD 657). They revolted and fought against both the Umayyids and the ‘Abbasids.

[15] A group of Khawarij named after Nafi‘ b. al-Azraq (d. AD 685).

[16] A group of Khawarij named after Zyad b. Asfar whom they followed. They opposed the Azariqa and Ibadiyya and held more moderate views.

[17] A group of Khawarij who followed ‘Abdullah b. Ibad. They rebelled against Marwan b. Muhammad (d. AD 744), the Umayyad caliph.

[18] A group of Khawarij who, according to al-Shahristani, held that when the Imam committed an act of disbelief, his subjects also became disbelievers.

[19] It appears that Donner has developed the argument restrospectively and explains the situation in early Islam in the perspective of‘Abd al-‘Aziz ibn Sa’ud’s (AD 1880–1953) policy to encourage bedouin to effect hijra from the nomadic to sedentary life in order to create the ikhwan, a para-military force which he used agains the Sharifians of Hijaz. Each settlement was called a hijra.

[20] This author, ‘Abd al-‘Aziz b. Muhammad b. al-Siddiq, belongs to a family of scholars in Tangier. I have not been able to find much information on him. An autobiography of his elder brother (b. 1909), ‘Abdullah b. al-Siddiq, makes occasional references to him as “my brother, the ‘Allama, the Muhaddith” (e.g. ‘Abdullah al-Siddiq 1985: 3). ‘Abd al-‘Aziz is also mentioned as one of his students (‘Abdullah al-Siddiq 1985: 8).

** Chapter Three: The search for knowledge in medieval Muslim societies: a comparative approach

Sam I. Gellens

Anas b. Malik reported that the Prophet said: Those who go out in search of knowledge will be in the path of God until they return.

(al-Tirmidhi, Sunan, 39: 2)

This chapter suggests how three medieval Islamic societies might be studied within a comparative historical framework. To do so, we have selected a prominent feature of everyday life, the rihla or talab al-‘ilm (travel for the sake of acquiring religious knowledge), which was common to medieval Muslims throughout dar al-Islam. Talab al-‘ilm, given its deep roots in the Islamic tradition, its popularity, and its ability to facilitate movement and exchange among Islamic societies, demonstrates the virtues of the comparative method in studying Islamic history. Its study reveals both universally shared sentiments and the strength of local ties as possibly no other societal trait could.

In an essay on the comparative history of European societies. Marc Bloch (1967 [orig. 1928]: 47) wrote that one use of the comparative method is:

to make a parallel study of societies that are at once neighbouring and contemporary, exercising a constant mutual influence, exposed throughout their development to the action of the same broad causes just because they are close and contemporaneous, and owing their existence to a common origin.

Though Bloch restricted his analysis to Europe, his formulation makes eminent sense for several reasons when applied to medieval Islam.[21]

First, there is the vast physical expanse of dar al-Islam, a broad complex of peoples, geographies, and political structures that owes its existence and inspiration, in a fundamental sense, to a specific time and place: seventh-century Arabia. The Prophet Muhammad, the Qur’anic revelation, the Arabic language, and the cities of Mecca and Medina acted then as now as historical referents which bestowed a kinship on all Muslims regardless of birthplace or domicile. No matter how distant from Arabia, all medieval Islamic societies could claim a share in this common origin, this common Muslim heritage focused on the natal centre of Islam.

The dispersal of the Arabs and Arabic into the former Byzantine and Sasanid territories and beyond, the acceleration of the pace of conversion in the late third/ninth century, and the multiple influences and contributions of such newly Islamised peoples as the Iranians, Turks, and Berbers created a world civilisation extending from the Atlantic to the Oxus. Out of this vortex developed a multiplicity of local centres for traditional Muslim learning that did not, however, rob the Islamic world of its essential unity. Indeed, one of the most compelling aspects of Islamic history is the continuing dialogue among Muslims over the relative merits of local attachments versus perceived universal sentiments and obligations.

This civilisation — really a network of variegated societies united by their commitment to the shari‘a — was one which in the fullest sense owed its vibrancy to constant movement. Travel in all its myriad forms — pilgrimage, trade, scholarship, adventure — expanded the mental and physical limits of the Muslim world, and preserved and nourished the various contacts that Muslims perennially maintained with one another. As Ross Dunn (1986: 5–6) has noted in his recent study of the renowned Muslim traveller, Ibn Battuta, Marco Polo visited China as a stranger and alien, whereas his Muslim counterpart compiled a rihla on the basis of distant journeys to lands either wholly or to some degree Muslim. Ibn Battuta may not have known the local languages of the places he visited, but he did know the cultural language of Muslims and hence felt at home.

Travel in its broadest definition ensured the unity of the Muslim community, but likewise encouraged appreciation of one’s home. Spain, Egypt, and Iran were medieval Islamic societies each with a distinct character. Yet each region was part of a larger civilisational whole. These societies, to paraphrase Bloch’s formulation, were neighbouring and contemporary, reciprocally influential, and subject to developments in religious learning, politics, trade, and warfare that were generally common to dar al-Islam. Travel bound them together and simultaneously stimulated the appearance of their local and regional identities. It is within the confines of this dialectic that we find the utility of the travel concept for the comparative study of medieval Muslim societies.

[[d-f-dale-f-eickelman-james-piscatori-muslim-travel-3.jpg][Figure 3.1 Majnun at the Ka‘ba with his father and other pilgrims. This miniature, taken from the Khamseh of Nizami, is later Herat/Timurid work of 898/1492-3. (British Library Ms. ADD.25900F. 114B. Used with permission.)]]

Travel as a meritorious activity is endowed with an ancient pedigree in the Muslim tradition. A rich vocabulary of words related in one way or another to travel is found in the Qur’an and the hadith. Sura Quraysh, 106: 2, refers to the rihla (the sole mention of the term in the Qur’an) in connection with the special accomplishments of the tribe of Quraysh and how much they owe their succes to God’s providence. The Qur’an intends us to understand here that the Quraysh above all, with their talents for “journeys south and north” (presumably meaning to Yemen and Syria), should accept God’s

commands. Thus, embedded deep in Muslim consciousness is an identification of travel with pious activity, an appreciation that achievement in such endeavour is a sign of divine approval and munificence.

As an organising principle for comparative analysis, only travel for the sake of religious scholarship specifically concerns us here. Initially, we must consider the problem of terminology. In the period under consideration in this chapter (four — fifth AH/tenth — eleventh AD centuries), the expressions rihla (travel) and talab al-‘ilm (seeking knowledge) could almost be used interchangeably. Throughout the Spanish tabaqat literature,[22] the two are often linked together, and when they are not they bear the same general meaning (travelling to seek religious knowledge). There are references to the rihla as hajj, but it is the former usage that is dominant. It is not until the late sixth AH/twelfth AD century that the two terms diverge. Rihla becomes identified primarily with the experience of the hajj — the examples of Ibn Jubayr and Ibn Battuta come immediately to mind — while talab al-‘ilm retains its original meaning.[23] This change may reflect the institutionalisation of the madrasa system in place of the formerly more individualised, orally-oriented relationships which prevailed between students and teachers in the early medieval centuries of Islamic history. Thus, Ibn Battuta usually looks for buildings — i.e. colleges of Islamic law and Sufi convents — rather than the solitary but renowned scholar here and there on his itinerary. The bulk of the references in the hadith literature are to talab al-‘ilm and not rihla. It is evident then that talab al-‘ilm, as a concept describing a specific aspect of movement and exchange among Muslims, is the more precise and accurate of the two terms.

The hadith literature reminds the believer that the search for knowledge is intimately tied to the physical act of travel. In this regard, several themes recur in the principal hadith collections: teachers and the learned as the only valuable human beings; the high merit of seeking and spreading knowledge; travelling in order to gather it; and the possession of knowledge as a sign of grace which reduces distinctions of birth and rank among Muslims.

Provided it was done for the right reasons, travel in the classical Muslim conception, to use Paul Fussell’s (1980: 39) words, “was conceived to be like study and its fruits were considered to be the adornment of the mind and the formation of the traveller”.

The best-known hadith on the subject — i.e. “The seeking of knowledge is a fard incumbent upon every Muslim” — is coupled in the collection of Ibn Majah (Sunan, I, no. 224) with the admonition that “He who places knowledge with those with whom it does not belong is like he who gives jewellery, pearls, and gold to pigs”. This report elevates talab al-‘ilm to the status ofa ritual obligation and stresses the care one must take in disseminating knowledge.[24] In his

Muwatta (1951, II: 1002), Malik b. Anas transmits a hadith from the pre-Islamic hero, Luqman, who advises his son: “Oh my boy, sit with the learned (‘ulama’) and mingle with them on your knees. For just as God gives life to people’s hearts with the light of wisdom, so he enlivens the dead earth with the downpour of the heavens”. The ideal company for a Muslim is the learned, for they represent a life-giving (and sustaining) force within the community. If indeed they are the best company, we could assume from this hadith that the believer should seek the presence of the ‘ulama’ wherever they are; hence the importance of travel for the sake of attaining knowledge.

Recognised as a Companion by some, Abu al-Darda’ was a younger contemporary of the Prophet and an authority on the Qur’an who served as a qadi in Damascus and died there in AH 32/AD 652–3 (Jeffery 1960: 113–14). On one occasion, a class he was giving in the mosque of Damascus was interrupted by a man from Medina who had come to ascertain the validity of a Prophetic hadith which Abu al-Darda’ had transmitted. The latter asked the man whether he had brought merchandise or anything else with him. When the man gave a negative reply, Abu al-Darda’ responded with the following:

He who follows a road seeking knowledge, God will make the path to heaven easy for him. And the angels will place their wings so as to aid the seeker of knowledge. And all in heaven and on earth, even the snake in the water, will seek forgiveness from such a person. The merit of the learned man over the worshipper is like the merit of the moon over the rest of the stars. The ‘ulama’ are the heritage of the prophets. The latter did not bequeath dinars and dirhams. Rather they left behind knowledge. He who takes it should do so with an abundance of good fortune.

(Ibn Majah, 1972: I, hadith no. 223)

The message here is obvious: God views with great favour those who pursue talab al-‘ilm to the point that such activity facilitates entry into heaven. Worship (meaning prayer) undoubtedly brings the believer closer to God, but it is the learned one who enjoys an even more special relationship with Allah. It is the man from Medina who travelled to Damascus seeking to verify a hadith who is unstintingly praised, and we may assume that this adulation would apply to all Muslims who would travel for the same or similar reasons.

Given the intense interest in travel for the sake of scholarship in the hadith literature, it is no wonder that it became a normative feature of medieval Muslim education, at least until the sixth AH/twelfth AD century. Though local and regional traditions were always influential in shaping religious and intellectual life, medieval Muslims really knew no boundaries in their desire to master the subjects which comprised the canonical syllabus of learning: among others, they included the Qur’an, hadith, tafsir

(commentary on the Qur’an), and qira’a (correct recitation of the Qur’an). Scholarly peregrinations were frequent and often long, in terms of both time and distance.

A man could study in twenty different cities with as many different teachers in each and return home yearning for yet another trip. A representative example is the Cordoban shaykh who went east in AH 330/AD 941–2 at the age of fourteen (Ibn al-Faradi 1966: biography no. 1360). During his trip, he followed an extensive itinerary that included Mecca, Medina, Jidda, Yemen (Sana‘a, Zabid, Aden), Fustat, Jerusalem, Gaza, Ashkelon, Tiberias, Damascus, Tripoli, Beirut, Caesaria, Ramla, Farama, Alexandria, and Qulzum. This tidal flow of scholars and scholarship across the Islamic lands eventually established the primacy of certain cities and regions as learning centres.

A shifting hierarchy of learning centres emerged. Depending on political and economic conditions, different cities in different periods could vie for pre-eminence in this regard. Whereas, for example, Baghdad set the standard in the third-early fourth AH/ninth-early tenth AD centuries, it was Cairo under the Fatimids and Nishapur in the succeeding two centuries which attracted Muslim scholars. This hierarchy could also depend to a lesser degree merely upon opportunity — for instance, a scholar might opt for one city as opposed to another because it was closer to his place of origin or had a sufficient number of well-known divines residing in it. But it is evident from our sources that travelling scholars were exceedingly well-informed. They knew where the leading scholars lived and acted accordingly. A scholarly traveller of the type discussed

eagerly contacted local ‘ulama’ wherever he went, but he always knew where he would be most rewarded.

Although more research needs to be done on its exact nature, rihla/talab al-‘ilm deserves its status as a unifying theme of medieval Islamic history. For Muslims who undertook it, it was an experience to be relished in a variety of contexts. Yet rihla/talab al-‘ilm also contributed, as already noted, to regionalism and localism. Why is this so? First, the powerful forces that were generated — perhaps as early as the second century after the conquests — blended the ancient traditions of the Near East, transmitted by converts to Islam, with those of the Arab settlers. This blending produced new Muslim communities, each proud of its distinctive heritage, both old and new. The special qualities or merits (fada’il) assigned to Mecca and Medina in the Qur’an and the hadith literature established a precedent and a paradigm for newly-constituted Muslim communities. Mecca, of course, possessed both a privileged pre-Islamic status and a central place in Muslim tradition. This duality of distinction was copied and reproduced — initially perhaps in Egypt — by other Muslim societies, and gave birth to a literary genre called fada’il, which bred cultural competition among cities in particular.

Second, there was the psychology of the traveller himself. For example, a scholar who left Cordoba or Seville to perform the hajj and study with the learned men of North Africa and Egypt did not do so as a peripheral malcontent. He was usually at least a man of solid middle-class background and some local intellectual renown, and one fully imbued with the values of his native land. He marvelled at the sights that he saw in Mecca, cherished the memory of classes that he attended in Fez or Damascus, yet returned home still convinced that the homesickness he experienced was genuine and that no other land surpassed the merits of al-Andalus.

Perhaps all of this conforms to the three stages of Joseph Campbell's myth of the hero (quoted in Fussell 1980: 208): the setting out and separation from the familiar; the trials of initiation and adventure; and the return and re-integration into society. As our hypothetical Spanish scholar passed through these stages, he was reminded of both his citizenship in an international community of Muslims and his ties to his region and city in Spain. Unlike Fussell's British travellers of the modern inter-war period, most Muslim travellers returned home thankful to be there, and their re-integration was often a measure of how successfully the travel-for-study experience reinforced local identity and pride.

Spain, Egypt, and Khurasan are three examples of intellectual centres with strong local identities. Each contributed to and participated in the rihla/talab al-'ilm network. A Muslim in search of religious knowledge could find a warm reception in each region which would cement his ties to the international Muslim community of which he was a member. But he would also encounter that strength of local sentiment which we have described, as the following examples suggest.

Al-Subki (d. AH 771/AD 1369–70), the compiler of the most important biographical collection on the Shafi'i law school, tells us ofa shaykh (d. AH 463/AD 1070–1) from a town near Baghdad who, wavering between a trip to Cairo or Nishapur, received the following advice:

If you go to Cairo, you will go to only one man [Ibn al-Nahhas]. Ifhe escapes you, your trip will be ruined. But if you go to Nishapur, there you will find a group of scholars. If one should elude you, you may obtain the help of one from among the rest.

(al Subki 1964 IV, 30)

Needless to say, the man opted for Nishapur.

Egypt also had its adherents. In the late fourth AH/tenth AD century, the geographer, al-Muqaddasi (1906: 197), extolled the virtues of Fatimid Cairo. He declared it vastly superior

to Baghdad, Damascus, and Nishapur in many respects, his most important comment for our purposes being that it was the habitat or breeding ground (ma‘dan) of the ‘ulama’. Naturally we find echoes of this rivalry between cities and regions in the fada’il literature. Drawing in part on legends surrounding Egypt’s pre-Islamic history, ‘Umar b. Muhammad al-Kindi (1971: 45), the son of the famous Egyptian historian (Abu ‘Umar Muhammad, d. AH 350/AD 961–2), could claim:

Wise people agree that the people of the world strive to travel to Egypt and seek to make a living there. But the people of Egypt do not seek to make a living in any other country, and do not travel anywhere — even if there were a wall separating Egypt and the countries of the world, so much is available in Egypt that its people would have no need of them.

Suffice it to say that on the Egyptian side of that wall was a sufficient and vibrant network of scholars.

Muslim rulers were also drawn into the competition spawned by the rihla. The fourth AH/tenth AD century was the height of Spanish Umayyid power and visits by Spanish Maliki scholars to Egypt. In his invaluable guidebook to Cairo’s tombs and cemeteries, Ibn al-Zayyat (d. AH 814/AD 1411–12) reports that the Caliph ‘Abd al-Rahman

III al-Nasir regularly sent 10,000 dinars for the maintenance of Maliki fuqaha’ in Fustat. Not to be outdone, the Egyptian ruler Abu al-Misk Kafur ordered that 20,000 dinars be distributed among the Shafi‘is (1907: 190–1).

In sum, these examples should remind us of the close links between rihla/talab al-‘ilm and fada’il as key ingredients in medieval Muslim self-definition. As noted, travel for the sake of study was a process which could emphasise universal traits common to all Muslims. For the scholar, it meant the exchange of ideas, books, and even addresses of teachers in distant cities; for the merchant, goods, services, and an awareness of new business methods and perhaps even technological innovations in manufacturing and agriculture; and for everyone, the experience of seeing other lands. If we accept Dunn’s assertion that the rihla was above all “an account of a journey (or journeys) to Mecca”, then the hajj was of course the most supremely universal trait of all (Dunn 1986: 310).

The frequency with which medieval Muslims pursued talab al-‘ilm is an excellent indicator of their self-image and how much the rihla concept owed to the exigencies of time and place. Looking at Egypt first, we find that the term rihla itself rarely appears in biographies of Egyptian ‘ulama’. Primary sources for Egypt in our period (fourth-fifth AH/tenth-eleventh AD centuries) are limited to the abbreviated biographical work of Ibn al-Tahhan (d. AH 416/AD 1025–6) and the

obituary list of Ibn al-Habbal (d. AH 482/AD 1089–90). But even from these materials we have the distinct impression that Egyptians felt that they were self-sufficient with regard to learning. Egypt's most celebrated early historian and first known compiler of a biographical dictionary devoted exclusively to Egyptians, Ibn Yunus al-Sadafi (d. AH 347/AD 957–8), never left Egypt. Yet his reputation as an 'alim was unquestioned and we find his unfortunately lost biographical work frequently quoted by Muslim authors.

As al-Kindi's observation reminds us, the Pharaonic view of Egypt as the centre of the universe became part of the cultural heritage of Islam in Egypt. As a centre for Islamic studies, Egypt did not match the initial rate of development that Iraq enjoyed. But, by the fourth AH/tenth AD century, it was a much-respected regional entrepot of learning. Its capital, Fustat (now Cairo), was a magnet for Muslims from all over the Mediterranean. Egyptians themselves saw little reason to seek knowledge elsewhere. The scarcity of Egyptians in the lists of ghuraba' (foreign scholars) in Spanish, Iraqi, and Persian biographical works underlines this attitude. Fustat was a teeming, sophisticated way-station, reception

centre, and seat of learning for those making rihlas. But the rihla as a self-defining concept in Egyptian Muslim life seems to have played a minor role.

Turning to Spain, we find the exact opposite of Egypt. The rihla was the central feature of Spanish Muslim intellectual life. We are blessed with a rich biographical literature for Spain (Ibn al-Faradi, Ibn Bashkuwal, al-Dabbi, and Ibn al-Abbar) which is both local and primary in nature. The several thousand biographies in these collections trenchantly document the significance of rihla/talab al-'ilm for Spanish Muslims.

Initially, we should note the role of geography. Located at the western limit of the medieval Islamic world, it is very natural that travel for the sake of study would achieve its most impressive development in Spain. With the possible exception of their co-religionists in Sicily, Spanish Muslims had more contact with Christians and Christendom than any other region of dar al-Islam. Muslims, although constituting the dominant culture, ruled a large Christian subject population and, whatever the state of religious and political antagonisms, maintained economic relations with the Christian lands of northern Spain.

Far more crucial is the fact that from the late fifth AH/eleventh AD century, Muslim Spain was increasingly threatened by a militant crusading movement, fervently Spanish Catholic in orientation. Spanish Muslims had every reason to seek spiritual refreshment in areas where Islam was the majority culture. Egyptians could really afford, so to speak, to remain at home, whereas for Spaniards, rihla/talab al-'ilm truly meant the survival of Islam as a coherent, shari'a-based way of life. What began as

“refreshment” conferring social benefit in the third AH/ninth AD century gradually became an unavoidable necessity by the sixth AH/twelfth AD, given the changing political and military conditions in medieval Spain and the increasing emigration of the corps of Maliki ‘ulama’ to North Africa and Egypt. Embattled both physically and mentally, Spanish Muslims looked to other communities, the Maghrib in particular, for intellectual succour.

Our sources do not explicitly indicate that Spanish Muslims clearly perceived themselves as peripheral or marginal. However, given their distance from the early centres of Muslim scholarship, it is reasonable to assume that during the second-early fourth AH/eighth-early tenth AD centuries they would look eastward for appropriate models of learning in hadith. We may find a parallel in the early medieval Jewish communities of Spain, North Africa, Egypt, and the Franco-German region. These communities were initially dependent to one degree or another upon famous yeshivot

(academies) of Iraq. So too were the Muslims of Spain, Tunisia, and Egypt upon their counterpart centres of learning in Iraq. Whereas the study of fiqh developed locally in Spain (inspired no doubt by the development of Maliki fiqh in North Africa) from an early date, hadith did not, hence the relatively substantial percentage of biographies of Muslims who went east to immerse themselves in that field. If a sense of intellectual periphery (Spain) and of centre(s) (Iraq and increasingly Egypt and Tunisia) did exist, it certainly was not something about which Spanish Muslims wrote. However, the biographies provide evidence of a perception of periphery that cannot be denied — at least as far as hadith study is concerned. On the other hand, this attitude was exaggerated and intensified by the political turmoil which prevailed among Spanish Muslims and by the accelerating advance of the Reconquista in the early sixth AH/twelfth AD century.

None the less, we should not assume that talab al-‘ilm achieved acceptance as a fard in al-Andalus, despite the gravity of the situation. We referred earlier to the Prophetic hadith on the subject of talab al-‘ilm as a fard. This hadith was hotly debated throughout the medieval Muslim world. For evidence of this, we need look no further than the Spaniard Ibn ‘Abd al-Barr’s (d. AH 464/AD 1071–2) Jami‘ bayan al-‘ilm wa-fadluhu (The Exposition and Excellence of Knowledge). The author was the most famous hadith specialist of his time in Spain and North Africa and achieved his reputation without every having studied outside of Cordoba!

Ibn ‘Abd al-Barr devotes the first nine pages of his work to the question of whether or not talab al-‘ilm is a fard. As we read his presentation of the opinions of various early scholars, we realise that there was no consensus on the legal status of travel for the sake of study. For example, when asked about the problem, Malik b. Anas says: “How admirable is talab al-‘ilm! As to its being a fard,

no”. And in a different transmission, he answers: “No. But it means seeking from a person that which one can put to good use in his religious faith” (Ibn ‘Abd al-Barr 1975: 5). There is no doubt about the crucial importance of talab al-‘ilm, but every doubt concerning its status as a ritual obligation. At best, the authorities quoted by Ibn ‘Abd al-Barr are ambivalent, their commentary occasionally cryptic.

Talab al-‘ilm may have come to represent a fard in a de facto sense, a way of dealing with an increasingly insecure and disturbing political, social, and intellectual reality for Spanish Muslims. It is likely that it reinforced both communal feeling within Spain and the bonds which Spanish Muslims maintained with their co-religionists in other regions. As such, talab al-‘ilm was the Andalusian method

of expressing how their peripheral Islamic society related to the more central heartlands of the umma, especially after the fall of Toledo (AH 478/AD 1085–6) and the steady progress of the Reconquista.

However, what one brought back, rather than the original motivation for going, could have been a decisive factor here. The physical search for religious knowledge was both an adventure and a religious duty. The ‘ulama’ were, of course, not the only Muslims who undertook journeys, but the overwhelming testimony of the biographical literature shows that they were by far the most likely to do so, given their needs and vocations. The search for religious knowledge also conferred distinction. Those who completed the journey returned home not only with an expanded religious knowledge, but also — and perhaps more importantly — with the experience of other lands and other Muslims, which heightened their appreciation of their native land. The sections specifically set aside for foreign-born scholars in the biographical collections show a “diaspora” of Spanish and other Muslims who never returned home. The majority did return, however, to the merit of both themselves and the cities and regions which they had left. Undoubtedly, their perceptions of centre and periphery changed in the course of their travels; that is to say, the cultural enrichment and expansion of the periphery blurred the distinctions which had of necessity existed formerly between it and the centre.

The Spanish biographies yield a variety of characteristics that enable us to profile rihla/talab al-‘ilm as it was understood in al-Andalus. First, it was the most important aspect of Spanish learning. The concept permeates the language of the Spanish biographical dictionaries. The experience was a multi-faceted intellectual endeavour, with neither hadith nor fiqh always enjoying primacy. It occupied a very special position in Spain in that those who travelled (ahl al-rihla) represented a distinct category of individuals. These men were heavily urbanised, ethnically heterogeneous, and solidly middle class in vocation and social outlook. They were drawn from the corps of Maliki fuqaha’, or jurists, which socially and politically stood between khassa (upper class or elite) and ‘amma

(the “masses” or lower classes) in Muslim Spain (Benaboud 1980–1: 5–45). They were objects of praise but also had advantages of a practical nature in the sense that public offices such as the post of qadi were reserved for them by the ruler and his high officials. A famous teacher’s reputation increased when he made a trip and, in addition, returned with a new or rare text previously unknown in Spain.

People of all ages engaged in rihla/talab al-‘ilm, although those

between the ages of 20 and 50 appear most often in the tabaqat. Trips were often family-oriented. Learning began at home and one’s renown was based on the intellectual foundation initially passed on within the extended family unit. Sons (and occasionally daughters) accompanied fathers and often then made a trip of their own, usually in the company of a brother, cousin, or close friend. We should add here that these customs were not peculiarly Spanish. Muslims the world over pursued study for the same reasons and in the same manner, whether they lived in Cordoba, Cairo, or Nishapur.

In Muslim Spain, many travelled for the sake of study. In Egypt, by contrast, it would appear that a minority among the corps of ‘ulama’ did so. Khurasan, through the example of its great city of Nishapur, occupies a unique intermediate position between al-Andalus and Egypt. In the fourth AH /tenth-eleventh AD centuries, Nishapur was a wealthy and powerful urban entity under the successive rule of the Samanids, Ghaznavids, and Saljuqs. A strategic nexus on the trade routes to China and India, Nishapur was home to an affluent and influential network of ‘ulama’ families who, during our period, controlled political activity within their city. They are known to us through the Ta’rikh Nisabur by al-Hakim al-Nisaburi (d. AH 405/AD 1015–16) and its continuation by ‘Abd al-Ghafir al-Farisi (d. AH 529/AD 1135–6). The several thousand Arabic biographies in these works provide us with a very different perspective on medieval rihla/talab al-‘ilm.

Unlike the Egyptians, people from Nishapur did not stay home. But the nature of their travels seems to have been different from that of their Spanish peers. Spanish Muslims travelled all over al-Andalus. Likewise, Nishapuris journeyed the length and breadth of Khurasan and Iraq and Central Asia too. What is striking is the contrast in linguistic usage between the Spanish and Nishapur biographical notices. Very rare is the phrase lahu rihlatun or the verb rahala itself. Instead, we see the verbs kharaja and qadama frequently. Talab al-‘ilm, of course, is a major concern but not in an explicit manner. For example, there is the following except from the biography of Nasr b. al-Hasan b. al-Qasim al-Shashi (d. AH487/AD 1094–5):

He went to Nishapur as a young man on business ... he went to lands west of Nishapur (bilad al-gharb) ... and God blessed him with his acquisitions and

commercial activities to the point that he had an abundance of wealth ... then he returned to Nishapur and made his home there.

(Frye 1965: 127)

Obviously, there is plenty of movement and exchange here and we should add that this example is not untypical of the Nishapur biographies. We find important information as well in this biography on the man’s training in hadith study. Travel for the purpose of study is present but it somehow does not convey the intensity present in the Spanish sources.

Though subject to periodic political upheaval and economic dislocation, Nishapur and its Perso-Islamic culture area were never even remotely threatened by the likes of a Christian Reconquista (although the initially pagan Mongols devastated Khurasan in a manner that Christian knights never did in Spain). In our period, however, it was almost wholly Muslim — confident, prosperous, and self-assured. Nishapur scholars sought knowledge, particularly in the realm of hadith, as readily as their Spanish counterparts, but perhaps without that urgent sense of “mission”, which may account for the Spanish preoccupation with rihla/talab al-‘ilm. Travel for the sake of knowledge was possibly routine for the ‘ulama’ of Nishapur. It was taken for granted in a way that it was not in Spain, hence its elevation to such a lofty status among Spanish Muslims.

Spain, Egypt, and Khurasan all embraced the ideology, which was the basis of travel for the sake of study. But, for a variety of reasons, they experienced it differently. In Spain, it was a primary aspect of one’s identity as an ‘alim and reflected the country’s peculiar status on the periphery of the Islamic world. For the Egyptians, it was just the opposite. They too respected the concept but felt little obliged to pursue it. With Nishapur and, in general, the Iranian/Central Asian culture region that looked towards not the Mediterranean but China and India, we encounter a corps of scholars who rarely used the “key term” itself but did engage in the process to which it was applied. They circulated within a “local” network and, to a greater degree than their Spanish and Egyptian peers, used the status conferred by their education effectively to influence and sometimes to dictate the political affairs of their cities.

In using this particular comparative approach, we have returned not to an “essentialist” or “reified” view of Islam or being Muslim. Instead, we have utilised rihla/talab al-‘ilm as a means of comprehending how one activity fundamental to early medieval Islamic education was understood in three distinct Islamic societies so distant in time and place from our own.

[21] The periodisation of medieval Islamic history remains a subject of debate. For the purposes of this paper, the approximate chronological boundaries are AH 236-545/AD 850–1150. It was during these centuries that the distinct characteristics of the fluid network of religious learning studied here developed and flourished.

[22] Tabaqat literally means “classes” or “generations”. It is a label for one of the most characteristic genres of historical writing in Arabic, Persian, and Turkish — the biographical dictionary. Usually arranged alphabetically, the tabaqat collections deal with all manner of individuals (such as caliphs, poets, and saints), but here we refer exclusively to those collections devoted to religious scholars (‘ulama’).

[23] It is interesting to note that in Morocco after the tenth/ sixteenth century, the rihla shifts from association with the hajj to travel only within Morocco.

[24] Though the question of talab al-‘ilm as a fard (ritual obligation) is discussed on p. 60, it is worth noting at this point that an ‘alim’s status did not depend on the journeys that he pursued in order to acquire learning. The problems of which characteristics defined an ‘alim has generated substantial debate in recent years. Knowledge of hadith above all was a quality which certainly distinguished an ‘alim. But loyalty, status, reputation, and responsibility figured prominently as well. Making a rihla did of course enhance one’s status and reputation but sanction for it was a local/ regional matter. The need for and value of it depended upon time and place. Thus it is difficult to be precise about the criteria for an ‘alim’s status. As Richard Bulliet (1972) and Roy Mottahedeh (1980) have shown, access to religious learning was largely unrestricted and open to talent. There was an egalitarian sense to the process, yet this did not preclude the influence of inherited distinction and wealth. In the case of Nishapur, what mattered was not who learned but who taught. Moreover, there were identities and affiliations — membership in urban socio-political factions and Sufi brotherhoods, or ethnic bonds — which could co-exist with or even supersede one’s being an ‘alim. These identities varied considerably over time and place. Bulliet’s “patricians of Nishapur” had no counterpa in Egypt, although the Egyptian ‘ulama’ possessed a cohesion which was encouraged by the country’s geographic, economic, and intellectual significance in the fourth-fifth/tenth-eleventh centuries.

* Part Two: Travel accounts

** Chapter Four: The ambivalence of rihla: community integration and self-definition in Moroccan travel accounts, 1300–1800

Abderrahmane El Moudden

Travel (rihla) in Muslim culture is often valued for its integrating effects: the pilgrimage (hajj) leads the pilgrim to Mecca and Medina, and the search for knowledge (talab al‘ilm) leads the student to one of the esteemed places of Islamic teaching, such as Medina, Cairo, or Fez. In all these cases, travel brings individuals and groups to centres and unites them with the wider community of the faithful (umma). This chapter considers the consequences of such travel for developing a sense of locality. Did rihla serve only to unite the faithful or did it

also give to travellers a sense of local consciousness? I suggest that rihla is ambivalent: through it the traveller becomes more closely linked to the idea of the Muslim community as a whole, but at the same time learns what is specific to his own people and culture.

*** Rihla

Rihla, in the form of actual travel and travel accounts, was one of the main features of Muslim culture in the western part of dar al-Islam (realm of Islam). Since the early Islamic centuries, learned people ventured to the eastern lands of Islam, specifically to the Hijaz, seeking advanced learning in religious matters and spiritual fulfilment.[25] Rihla was particularly linked with the pilgrimage to Mecca and Medina, the fifth pillar of Islam. The travel was so long and risky that it was worthwhile for the literate to make written records of it which serve as useful guides for future pilgrims.

Rihla literature flourished in North Africa, especially in Morocco (Turki 1979) from the sixteenth century onwards. Muhammad al-Manuni (1983: 186–92), a leading Moroccan archivist, divides rihla accounts for the sixteenth through eighteenth centuries into three types:

1 Rihla within Morocco, in which the traveller did not go beyond one region or, at the very most, the whole area of what is currently Morocco.

2 Rihla hijaziyya, travel to the Hijaz. This form of rihla resulted in oral or written comprehensive reports on the travel and on the various aspects of the pilgrimage.

3 Rihla sifariyya, including embassies and missions, in which the writer reported on his travels in foreign lands. From the seventeenth century onward, Morocco sent missions to Christian European governments, including France, Spain, and Britain, as well as to Muslim rulers. The most significant embassy travel accounts are those written by ambassadors to the Porte, the Ottoman central government, at Istanbul. These envoys, on their way to accomplish their diplomatic mission or on returning, often performed the hajj — thus explaining why many sifariyya rihlas are also hijaziyya ones. An example is al-Zayyani (d. AH 1249/AD 1834) in the late eighteenth century (al-Zayyani 1967).

Travels to the Hijaz were certainly the most important type of Moroccan movement abroad prior to modern times (Lewis 1971: 37–8). Not only were they the most frequent, but they

were also the most comprehensive: the hijaziyya type could include the two other kinds of movement. Many pilgrims needed to travel within Morocco before starting the “real” travel towards the east. They needed to do so in order to join the pilgrimage caravan, which used to gather in specific cities before proceeding to the Hijaz, or in order to visit some of the more famous saints’ shrines for the sake of safety en route in this world and greater rewards in the next (Brunel 1955: 77, 112). The path of pilgrims was rarely direct; it needed to be circuitous to enable them to visit most of the sacred spots on their way (Raphael 1973: 14). Moreover, journeys to the Hijaz were important because they often brought back new ideas or even initiated broad changes in the Maghrib. Examples include the Almoravid and Almohad revolutions in the eleventh and twelfth centuries AD and the introduction of Wahhabi ideas in the early nineteenth century AD (al-Iraqi 1984: 125–54).

Rihla in both its aspects, hijaziyya and sifariyya, had two elements. By accomplishing rihla, Moroccan travellers shared experiences with various components of the umma. At the same time, they were able to understand their difference through experiencing numerous comparisons. To show this characteristic of rihla, I will rely mostly on hijaziyya accounts because this kind of travel was a more comprehensive undertaking. However, the sifariyya accounts are also relevant to developing a conscious sense of difference. In some cases, the diplomatic and somewhat secular goal of the travel was clearly perceived and expressed, and the sensitivity to differences, especially political ones, may have even been stronger and clearer in these texts than in the hijaziyya ones. However, this distinction should not be overdrawn.

*** Rihla, umma, and consciousness of identity

Taking part in rihla altered consciousness of the umma. There was frequent travel for military, commercial, intellectual, and religious reasons since the early centuries of Islam (see Gellens, Chapter 3 of this volume). Travellers, scholars, and merchants participated in extending the sense of frontiers of the umma through their activities. Rihla accounts illustrated for local readers and listeners the extent of the Islamic community, and thus created “an integrated, growing, self-replenishing network of cultural communication” (Dunn 1986: 10). This network of cultural communication operated, however, in politically fragmented and socially localised contexts. The case of Morocco is significant in this respect.

Three dimensions characterise Moroccan society prior to the colonial era. On the socio-economic level, most Moroccans lived in small- or medium-sized tribal and village communities. Interaction within these local communities was intense and movement outside of them primarily involved a few seasonal workers or itinerant shepherds (Montagne 1930; Berque 1955).

Politically, the rural areas were more or less linked to the central government, the makhzan, which was basically well established in the cities and in the plains surrounding them. In order to function adequately, the central government had to be a travelling institution: the sultans used to settle part of the year in Fez, in the north, and the rest of it in Marrakesh, in the south (Nordman 1980–1: 123–52). Members of the local elites were often ordered to join the sultan in one of these capitals and, in this way, experienced some of the variety of Morocco's lands and people. Rarely, however, did their experiences range beyond the areas of the ruler's peregrinations (El Moudden 1983: 141–5). This

administrative and military movement is noticeable in traditional sources at least since the eleventh century in the time of the Almoravid dynasty. Although the geographical extent of the Almoravid and Almohad states encompassed all North Africa and Muslim Spain, it was not until the sixteenth century, with the rise of the Sa'adi dynasty, that Morocco emerged as a distinct political unit more or less possessing its current political boundaries.

Finally, in intellectual and religious matters, religious intellectuals

(faqihs) constituted a network cross-cutting Morocco's social and economic fragmentation. This elite of religious intellectuals also constituted an important link between Morocco and the rest of the Muslim world. Since they were among those who were likely to have travelled outside their local areas or regions, in their own localities they were the ones possessing a concrete idea of what the umma was like and able to convey this idea to others. A Moroccan from the south-western region of the Sus, Ahmad bin Ali al-Jazuli (d. AH 1197/AD 1782–3), epitomises the different directions of such a network. Al-Jabarti, the late eighteenth century Egyptian historian, wrote in his biography of al-Jazuli:

He studied with us under the direction of my father, with the participation of Sidi Muhammad and Sidi Abu Bakr, the two sons of Shaykh al-Tawdi bin Suda [a leading scholar of eighteenth-century Fez], when they accompanied their father, that year, on the hajj; and with the participation of Shaykh Salim al-Qayrawani [probably from Qayrawan, Tunisia] (al-Jabarti n.d.: I, 571–2)

This example shows that whether sitting at some corner of al-Azhar in Egypt or al-Qarawiyyin in Morocco, taking part in religious learning still provided an important opportunity for Moroccans from different regions in the late eighteenth century to unite. In this case, al-Jazuli, who was from the Sus in the south of Morocco, encountered at al-Azhar students from Fez (the sons of Bin Suda), others from Tunisia (al-Qayrawani) and still others from Egypt (al-Jabarti). Such encounters occurred frequently and symbolised the network of cultural communication linking men of learning throughout the umma. Although al-Jazuli never made it back home, a majority of travellers must have returned to their point of origin with their knowledge and experience, and shared these with their fellow

tribesmen or townsmen. As a consequence, awareness of the areas outside the realm of Islam was often due to them (Dunn 1986).

These three spheres of practice and perception in Moroccan society — the socio-economic, political and intellectual, and religious — are clear in traditional sources at least from the sixteenth century onward (al-Nasiri 1954–6: VI, 100). How were these three spheres interconnected?

Imagine al-Tamgruti, the Moroccan ambassador to Istanbul in the late sixteenth century, first in his local environment of Tamgrut, a famous zawiya (a religious brotherhood or lodge), located south of the High Atlas mountains on the northern fringe of the Sahara. In terms of society and local economy, he might have been taking care of his palm groves between prayer times, negotiating and sharing the costs of repairing a saguia (irrigation canal), or leading a delegation of members of his village to argue with the members of a village downstream about water rights and shares. Politically, on specific occasions, such as major religious feasts, he might have been ordered to come to wherever the sultan’s capital was at that moment. At the intellectual level, he would certainly have met at the capital faqihs from other cities and regions of Morocco. He would undoubtedly have talked with recent hajjs (customary Moroccan form for hajjis, or pilgrims) about their adventures and encounters in the east and about the news from other Muslim lands.

Such an imbrication of the three levels in one personal experience was usual, particularly in the case of learned people, even though the majority of the rest of Moroccans experienced only their immediate environs. In such a socio-cultural environment, travel in its various forms constituted an important means of social, political, and religious integration.

Rihla to the Hijaz was especially important. More than an opportunity for Moroccans to accomplish a long and enriching, though risky, voyage,[26] it also provided a lasting personal experience. This is probably one of the reasons for the flourishing of the hijaziyya accounts in comparison to the other types of rihla accounts.[27]

For many centuries, the pilgrimage caravan was the most important, if not the only means of travel to the Holy Lands.

On their way, Moroccan pilgrims were forced to cross the majority of Arab Muslim lands. This fact alone gives the Moroccan travels a complexity that is reflected in the texts and colours the perception of sacred space and time. Religiously significant dates punctuate the days and months of the journey, as do shrines and important holy centres along the way; they frame the whole narration. The rihla of al-‘Ayyashi substantiates such an

observation: at every stage of his two-year-long travel, he visited shrines and met learned people (al-‘Ayyashi AH 1316: I-II; Kopf 1960: 785).

Two very important annual caravans left Morocco for the Hijaz cities — one from Fez, and the other from Sijilmassa, located in the south-east. Rihla texts indicate that travellers could quit the caravan in northern or south-eastern Morocco and rejoin it at one of its important stops during the journey — Tripoli, Alexandria, Cairo, Mecca, or Medina. Between each of these stages, the travellers recorded the name and condition of numerous stops of lesser importance.

For each of these stopping points, the rihla texts give more or less

detailed descriptions of ecology, wells, sweet or salt water, hot or cold weather, and the ease and safety of the route. The descriptions also focus on some of the economic possibilities of each region and record the kind of trade that the pilgrims may have transacted there. Much attention is paid to the inhabitants’ customs as well as to the religious and educational situation. Of course, throughout his text, the traveller kept close records on the most important men, scholars, and saints whom he met in each region, and on various scholarly or belles-lettres activities in which he happened to participate. It is for this reason that the rihla texts are usually encyclopaedic in character. Among other fields, they cover the religious sciences, history, biographies, and literature. Moreover, for modern scholars, they are a kind of documentary treasure, full of material of geographical, ethnographic, and even technological interest.

The medieval traveller was not, however, an aloof observer, detached from the matter of his depictions. He was often involved in the situation described and the rihla text must also be seen as an autobiography.[28] Yet it is not always constituted only by first-hand experience. When the traveller felt a shortage of interesting records about some point of his journey, he drew upon texts to fill the gap (Dunn 1986: 313; Morsy 1983).[29]

Through these various aspects, rihla texts testify that the journey to the Hijaz was an important means of integration of Moroccan pilgrims with the wider Muslim community. Moroccan travellers never felt completely foreign towards the inhabitants of the various pilgrimage itineraries. There was no great linguistic handicap for them, at least among the Muslim communities of the southern Mediterranean.[30] Indeed, on their way to the hajj, Moroccans sometimes felt so much at home that they considered it quite legitimate to try to impose their views of what they thought to be the right religious behaviour. Al-Jabarti recorded an incident of the sort for the year AH 1110/AD 1696, under the significant heading of “the Maghribi event”:

The Maghribi people of Tunis and Fez, who were accompanying the cloth cover that was to be brought to the Ka‘ba, in a procession through the central area of Cairo, tried to prevent whoever was smoking, along their way, from doing so ... This led to a conflict between them and the people of the bazaar of Cairo. The pasha arrested most of them, and consequently they missed the pilgrimage. Some of them died in prison, the others were released later.

(al-Jabarti n.d.: I, 51)

This incident shows that an exaggerated feeling of being at home was not always without complication. It is nevertheless interesting to note that the pilgrims, and specifically the learned people among them, moved easily throughout large areas of the Muslim world.

The example of Ibn Battuta (d. AH 1368) illustrates this basic point. Departing from his native Tangier in northern Morocco, he covered no less than 73,000 miles during his almost thirty-year career. While of course not constantly on the move — he settled long enough in one locale to marry and have a family (Damascus), or to reach positions of authority in the local ruling establishment (India and China) — he was far from isolated. Rather, in India, for example, he was able to meet old acquaintances from Damascus and even Granada. As Dunn says:

the scholarly class of the Islamic world was an extraordinarily mobile group. In the Maghrib of the later Middle Period the learned, like modern conference hopping academics, circulated incessantly from one city and country to another, studying with renowned professors, leading diplomatic missions, taking up posts in mosques and royal chanceries.

(Dunn 1986: 3, 68; quotation at 24)

As a major factor of individual mobility in pre-modern Muslim societies, the pilgrimage in itself was a complex phenomenon that enabled its participants to share most of everyday life with co-religionists. This journey was not only a religious enterprise, but, because of its length (15–18 months in normal travel, but quite possibly longer as in the cases of al-‘Ayyashi and Ibn Battuta), the pilgrims also observed and experienced common practices. For instance, in most of the important stages of the journey, Moroccan pilgrims converted their merchandise or slaves into cash, and purchased the different commodities that they needed for the journey, such as food and animals for transportation. For this reason, many rihla texts are in the form of market guides, advising future pilgrims about the best way to carry on advantageous trade on the way to the Hijaz (Zemmama 1984: 114–24). These guides, incidentally, show how business and pilgimage were so intimately connected that it is hard to detemine which one inspired the other.

At the main stages of the journey — Tripoli, Cairo, Mecca, and Medina — the pilgrims stopped for longer periods than they did at secondary places. There they were able to go to libraries, buy books, attend classes at al-Azhar in Cairo, or give lectures at the Prophet's mosque and shrine in Medina. They could also participate, as al-'Ayyashi did (Zemmama 1983: 156–68), in the great religious debates of the time.

Some Moroccan travellers or pilgrims preferred to settle permanently at one point of their journey. Al-Jabarti noted in his chronicles many cases of learned Moroccans who, after their return from the Hijaz, decided to stay in Cairo (n.d.: I, 327, 383, 572). One of them deserves particular attention because he could be seen as an example of how Moroccan travellers considered themselves as members of the larger Muslim community, even in the late eighteenth century — by which time Morocco had been an autonomous political unit for at least 200 years. Ahmad bin 'Ali al-Jazuli al-Susi, previously mentioned, first sought religious learning in his country. In AH 1182/AD 1768 he went on the pilgrimage and, on his way back, stayed in Cairo where, for a period, he studied at al-Azhar. Then he resumed his travels, going this time to the Rum, the central part of the Ottoman Empire. He participated there in a jihad (holy war), learned Turkish and was offered a high position in the capital. But, as was expected of a genuine faqih, he declined the invitation and returned to Egypt where he married and settled until he died in AH 1197/AD 1782–3 (al-Jabarti n.d.: I, 571–2). Through this example one can see how, in general, the hajj and the rihla were major ways for Moroccan travellers to realise their connections with other parts of the Muslim world.

One may wonder what impact the rihla accounts had on the rest of the people, who either did not go on the pilgrimage or, if they did, were unable to write a record of it. In fact, the pilgrims found a ready audience among those who could read. Among the illiterate, many listened to their long and frequently repeated oral reports. In effect, these travel accounts gave people who had never had the opportunity of leaving their native locality a chance to imagine a wider horizon. At the same time, however, they may have imparted something of the sense of difference from fellow Muslims that the travellers themselves experienced.

*** Al-'Ayyashi and his travels to the Hijaz: of differences and similarities

Abu Salim 'Abdullah al-'Ayyashi (AH 1037/AD 1628 to AH 1090/AD 1679) was a well-known seventeenth-century Moroccan traveller and scholar. Born in a small village in the eastern High Atlas mountains, his father was the head of the local zawiya. Al-'Ayyashi travelled to Fez to acquire the orthodox religious sciences, then went to Tamgrut to be initiated into one of the most active Sufi orders in Morocco at that time, the Nasiriyya (Hammoudi 1980: 615–41). Like many other Moroccan scholars, he soon felt the need to deepen his knowledge in eastern lands. He travelled three times to the Hijaz — in 1649, 1653, and 1661 — and stayed for long periods in Mecca and Medina, as well as Jerusalem

and Cairo. Everywhere, he participated actively in theological debates, both learning and teaching. His feelings and observations are incorporated into his two-volume rihla text, Ma’ al-Mawa’id [Tables Water].[31]

The title of this text signifies that the author intended it to be useful for the ‘ulama’ in Morocco and elsewhere as well. Although he focused heavily on theological subjects, he was also a keen observer of contemporary life. His text is full of precise comments on many aspects of the social, economic, and political mores of the peoples he met along the way to the Hijaz. Autobiographical information is also scattered throughout the text. Indeed, during his three travel periods, al-‘Ayyashi accumulated experiences and knowledge that helped him to constitute a more relative image of himself and his country. As a consequence, his judgements were neither absolutely negative nor completely positive towards such people of the eastern Muslim world as the Egyptians. While criticising some aspects of their lives, he did not omit, of course, to praise some of the positive sides. What remained constant was his sensitivity to differences.

Many of these differences he found insignificant, and treated them much as a tourist would in viewing an exotic scene. Some of them were of great significance, because he understood through them how his customs and even religious rituals differed from those that he was witnessing. While he felt neutral towards, or was even pleased, by the former, he was sometimes frankly embarrassed by the latter.

In Egypt, for example, al-‘Ayyashi was struck by the enormous population of Cairo as well as the Nile Valley in general. Its crowded markets and people hurrying in the streets contrasted with what he was accustomed to in the High Atlas region (AH 1316/AD 1898–9: I, 121–2). This was more or less the impression of many previous Moroccan travellers, such as al-‘Abdari and Ibn Battuta. Al-‘Ayyashi also noticed differences in food habits: for example, drinking coffee was a general and useful habit in Egypt, and it sufficed to make a guest content, but the same was not true for Morocco, where guests expected large meals (1898–9: I, 132–3). He also noted the great attention shown to mosques in Egypt in comparison to the relative neglect accorded to those of Morocco. In general, through his acquaintance with Egypt, he revealed an acute consciousness of the anarchy of Morocco in the 1660s and 1670s due to rivalries between local principalities (1898–9: I, 152).

However, al-‘Ayyashi could not help commenting on the negative

characteristics of fellow Muslims. The Egyptians, suffering from lack of pride, endured arbitrary government from the Mamluks without reaction or rebellion (1898–9: I, 121–1). He also disapproved of how Islam had been bureaucratised and corruption was tolerated in Ottoman Medina. He generalised:

All judiciary offices in eastern lands, whether in Egypt, Syria or the Hijaz, are acquired in return for money. Governors sell the offices of imam (prayer leader), khatib (sermoniser), muezzin (caller to prayer), qadi Gudge) ... to whoever offers best, without considering whether he has or not any competence for the office. This results in enormous dangers for Muslims and Islam. Concerning the office of judge, we have not heard, in all eastern lands, of a qadi whose judgements rely on the shari'a (sacred law). Their judgements depend on bribery, and a verdict may change many times during the same day in relation to the more or less great amount of the bribe.

(1898–9: I, 128)

Al-'Ayyashi related the case of such a qadi who wanted to apply the shari'a to the affairs of prominent men in Medina, but ended by being assassinated. He concluded: "One can only complain to God" (1898–9: I, 289).

Different ways of organising everyday life were especially disconcerting:

The teachers' custom in Medina is to vacation on Tuesdays and Fridays and classes meet on the other days, contrary to our custom of vacationing on Thursdays and Fridays in Morocco. When I was teaching in the Haram [Medina], they forced me to teach on Thursdays. It was hard for me because it was different from what we were accustomed to ... I asked them and insisted upon replacing Thursdays with Tuesdays, but they obstinately refused. I was forced to follow their custom.

(1898–9: I, 289)

Al-'Ayyashi could only console himself by reciting a verse of poetry: "If you come to a land in which all people are blind/ Close your eye, even if you have only one eye!"

The differences noted by al-'Ayyashi include prayer ritual. In the Maliki school of law, Muslims let their arms down while standing in prayer, whereas, in the other schools, worshippers fold their arms on their chests. But this latter custom soon spread to eastern lands including those where the Maliki school had influence. It widely came to be assumed that only heretical people (rafidi) let their arms down. Al-'Ayyashi noted the ironic case of a western

Maliki accused, in a Syrian village, of being heretical for precisely that reason, even though his accusers were Maliki themselves (1989–9: I, 292).

Often comparisons are realised through a theological challenge. It was customary for western Maliki faqihs to become involved in debates about the hadith (Prophet's traditions), and many of them like to report that they found their antagonists' knowledge weak. True to this tradition, al-'Ayyashi reported how in Jerusalem he outwitted an Egyptian Hanafi scholar, who was believed to be very learned (1898–9: II, 321–2).

In some paragraphs, al-'Ayyashi generalised his comparisons:

Nomads of Darb, Hijaz, Tihama and Najd are the most ignorant and tough people among Arabs. Only few of them care about prayers or Ramadan. Common people, Arabs and Berbers, in our Morocco, are faqihs in comparison to them. In Morocco, no one, however ignorant he might be, and even if illiterate, would be ignorant about how to do his prayers.

(al-'Ayyashi 1898–9: I, 313)

Here we meet the subjective aspect of comparison. When al-'Ayyashi decided to stay in Mecca for a long period, he justified it by saying that Mecca was the homeland for all the faithful. But, in the last pages of his rihla account, he showed just how deeply he was longing to return home: his thirty-month stay abroad seemed as if it had been a whole century (1898–9: II, 418). Within the umma, therefore, al-'Ayyashi felt closer identification to his own country and people, for the things that differentiated him from eastern peoples were exactly those that linked him to his compatriots in Morocco.

*** Al-Tamgruti and his rihla to Istanbul: competition over the umma

If we look at another Moroccan, but of the sixteenth century, we will find similar sentiments. I have avoided choosing the text of another eighteenth-century traveller for two reasons: first, the chronological development of the themes in rihla literature is not my principal concern here; second, by the eighteenth century, Morocco and the Ottoman Empire had reached a kind of modus vivendi and rihla texts were less interested in expressing difference and competition.

The text of Abu'l-Hasan 'Ali al-Tamgruti is one of the earliest accounts of Moroccan-Ottoman relations in the late sixteenth century, when competition over legitimacy within the

umma was still intense. Reading through Kitab al-Nafha al-Miskiyya fi’l-Sifara

al-Turkiyya [The Book of the Musky Breeze of the Embassy to Turkey] serves to indicate his reactions to the numerous aspects and events of his travel to Istanbul in 1589–90. He travelled there as the ambassador of the Sa‘di Sultan Ahmad al-Mansur (ruled 1578–1603) to the Ottoman Sultan Murad III (ruled 1574–95).

H. de Castries stated in his introduction to the French translation of the Nafha that little is known about al-Tamgruti outside of what we can infer from his own rihla account (al-Tamgruti/de Castries 1929: iv). Born about 1560 in Tamgrut, he died in 1594 or 1595 in Marrakesh. He belonged to the region in which the Sa‘di dynasty originated and might thus have been expected to be unconditionally faithful to Sultan al-Mansur.

Al-Tamgruti provided us with an interesting insight into the relations between his family and the Sa‘di dynasty when he wrote (1929: 45) that his late brother, Sidi Muhammad, had been sent as ambassador to the Ottoman lands before him. We can infer from this detail that al-Tamgruti’s family was in charge ofan inherited office that involved diplomacy between Morocco and Istanbul. At any rate, we can safely assume that al-Tamgruti was acquainted with Ottoman affairs well before his mission, especially through his brother’s accounts (1929: 45). The knowledge of the Ottoman provinces, Istanbul, and Ottoman society and state that is contained in his travel account did not therefore depend on first-hand experience alone, but was representative of what was known of the Ottomans among prominent families of the Sa‘di regime.

Al-Tamgruti said nothing of the real purpose of his official mission. Were the contents of the mission top secret? Or were oral reports on such matters more common? We simply do not know why al-Tamgruti’s account is silent here, but on other matters, such as itineraries and cities that he visited, he was prolix. He said of Istanbul: “In this city, there are so many people, craftsmen, properties, commodities, stores, and books that the traveller is struck by their number, which only God could count and know” (al-Tamgruti n.d.: 94; al-Tamgruti/de Castries 1929: 54). The size of the city and the variety of its activities were so unlike what he had known and so fascinated him that his colourful descriptions remind us of modern cartes postales of Istanbul.

The author’s general reaction to the Ottomans alternated between fascination and rejection. Al-Tamgruti was fascinated by the strength and power of the empire; after all, the Ottoman sultan was the most important Muslim ruler, able to oppose and fight the Christians. The same fascination could be noticed in his sensitivity to the language spoken by the Turks: in many places, he made specific comments on the rules of Turkish grammar (al-Tamgruti 1929: 85, 99, 103).

At the same time, al-Tamgruti clearly recognised his difference from the Ottomans, particularly in matters of law. Yet, surprisingly for a faqih, he did not record the name of any scholar during his six-month stay in Istanbul. He only wrote: “we attended the seminars of scholars who were in Istanbul and we learned many things from them” (al-Tamgruti/de Castries 1929: 68). It is possible that, as a Maliki, he was reluctant to detail the Hanafi school and its scholars, as he had done for the Maliki scholars of Tunis.

Speaking of the fiqh (jurisprudence) taught in Istanbul, he merely concluded: “they teach their law” (fiqhuhum).

On the political level, he expressed his rejection of the style of Ottoman rule much more clearly. When he was still on his way to Istanbul, he witnessed a rebellion among the Arab tribes in the countryside of Tripoli (al-Tamgruti/de Castries 1929: 31–4; Hess 1978: 113–14), which afforded him the opportunity to record Ottoman practices:

As a matter of fact, the Turks had oppressed the inhabitants of Tripolitania very much. They had devastated the country with cruelty, depriving people of part of their lands and houses and ransacking their wealth. They had been so unrespectful to Muslim women that, if they liked a girl, be she the daughter of a notable or of a prominent man, no one could have prevented them from [marrying] her. It was impossible to marry her to someone else.

(al-Tamgruti/de Castries 1929: 32–3)

As a consequence, many of the North African Arabs, from Egypt to Ifriqia (Tunisia), were turning their eyes towards the ruling dynasty in Morocco:

We have noticed among them an extraordinary willingness to being ruled by the sharifs, our lords. They want to share peace, equity, mercy and benefits that the Maghribis [Moroccans] enjoy thanks to [the sharifs].

(al-Tamgruti/de Castries 1929: 33)

We should not forget that it was a member of the Sa‘di regime who was speaking; a laudatory style would not have been unexpected. Nevertheless, these paragraphs go further and make a substantial claim for the Moroccan dynasty: because the sharifs were, or proclaimed themselves to be, descendants of the Prophet, they were the true

caliphs. This is clearly shown in the text when al-Tamgruti contrived to speak of the Ottoman sultan and the Sa‘di sultan in the same sentence:

The [Ottoman] sultan gave us his response to the credentials of the caliph, our lord sultan, sharif Ahmad al-Hasani. And in order to thank him, he gave us magnificent presents for him.

(al-Tamgruti/de Castries 1929: 68)

Over many Islamic centuries, travellers, pilgrims, scholars, and ambassadors felt themselves linked to the wider community of Muslims. While this trend continued of course, at the western edge of the umma from the sixteenth century onward, historical trends favoured the more conscious expression of a distinct identity for Morocco: Moroccans became more aware of being at an extreme frontier of the Islamic world and of the need to resist the Iberian offensives. They also became increasingly aware of being the only area outside of Ottoman rule in the south Mediterranean Muslim world. Travellers and travel accounts refer, from then on with greater frequency, to a more precise and self-conscious geographical, socio-cultural, and political homeland. While noting that they shared many characteristics with fellow Muslims throughout the broad community, therefore, writers such as al-‘Ayyashi and al-Tamgruti discovered other characteristics that they did not share and that distanced themselves from the umma. Rihla as text and as actual travel contributed to making both similarities and differences manifest, and left a sense of ambivalence that complicated what might have been assumed to be a natural identification with the umma.

*** Acknowledgements

I would like to thank S. Khalaf, D. Eickelman, and J. Piscatori for their comments and F.Z. Salah and V. Winder for their assistance with the English of this chapter. Remaining imperfections are mine.

[25] There is, often, a chapter on the rihla li-talab al-‘ilm (travel in search of knowledge) in Prophetic traditions. See, for example, Abu Dawud, Sunan, III, 317, tradition no. 3641.

[26] Risks ranged from the danger of being assaulted by bandits, to exposure to plague, desert, and sea.

[27] Al-Manuni gives twenty-two titles of texts concerning the period 1660–1790: two of them are sifariyya texts, three cover travel within the country, and seventeen are hijaziyya texts.

[28] Very often most of the biographical evidence available about the traveller is contained in his rihla account. This was the case of Ibn Battuta and al-Tamgruti.

[29] This vice, however, seems to be common to travel accounts in other cultures. See Morsy (1983).

[30] It is worth noticing that such a feeling is still at work today. In a recent interview, Faqih al-Basri, one of the most radical leaders of the opposition to the Moroccan monarchy during the last twenty-five years, answered a question in these words:

Question: “Le pays a du vous manquer ... ?”

Reponse: “Bien sur le Maroc me manque ... J’etais loin de mon village, de mes racines, mais j’evoluais dans une partie plus vaste que j’ai appris a decouvrir et a aimer ... le croyant est partout chez lui en terre d’Islam.”

(See Jeune Afrique, 15 July 1987, no. 1384, p. 24)

[31] Al-‘Ayyashi’s rihla is only partially translated into French: Berbrugger 1846 and Motylinksi 1900.

** Chapter Five: The pilgrimage remembered: South Asian accounts of the hajj

Barbara D. Metcalf

The pilgrimage to Mecca is unquestionably one of the great phenomena in the history of Muslim peoples. It has largely been studied from the perspectives of medieval travel and learning, of modern administrative issues and of topics in the religious study of rituals.[32] These studies provide a context for yet another approach, that of eliciting meaning in the pilgrimage, examining not only uniformities in the experience of Muslims but differences over time. The accounts written by pilgrims themselves invite an analysis of individual experience against the background of the social and political world in which they were produced. They are accounts of journeys that are at once inner and outer; and they are guides for us, both to changing patterns of religious sensibilities and to a world in technological, social, and political transition.

The South Asian accounts[33] take shape initially in the period of British rule, a period of complex and extensive re-definition of Islam and of community life; they continue, since 1947, in an Islamic republic and in a secular state where Muslims live as a minority. Nowadays, they are written in a world where Islamic values and Muslim identity seem increasingly significant. The hajj accounts produced in all these contexts show us important dimensions of Islam as a modern religion, of modes of self-presentation, and of Muslim social and corporate life as recounted in distinctive individual lives.

*** The scope of the accounts

The accounts of the hajj written by South Asians take many forms: travelogues, journals, letters, and guides.[34] They describe to different degrees and in different ways experiences of travel, judgements of other people and cultures, the meanings of the hajj and other central symbols of Muslim religious life, and — in so doing — offer self-representations of the pilgrim authors themselves. The authors include some well known figures: major religious thinkers like Maulana Siddiq Hassan Khan Bhopali (1872), the poet Shefta (1841), the Begum of Bhopal (1870), and the Nawwab of Rampur (1872), and, in this century, literary figures from ‘Abdu’l-Majid Daryabadi (1929) to Shorish Kashmiri (1967) as well as statesmen like Muhammad Zafrullah Khan (1967). A very substantial number of writers are from families touched by the institutions that emerged under British rule: they are well-born, literate in Urdu, of families with some mix of connections to government service, professions, and land.[35] But some are not from this type of background. Khwaja Hasan Nizami, himself scion of an illustrious Sufi family and a public figure in the first decades of this century, introduced, for example, the memoir of a craftsman, one Mistri Chiraghu‘d-din Pasruri (1926), insisting on its usefulness and telling the reader that it was pointless to object to its Urdu — on the grounds that the author was, after all, from the Punjab! A handful of accounts have been written by women, from the wife of an army captain in Madras (Saba Mustafa 1979) to a former school principal from Lahore (Zainab Kakakhail 1976). Recently the well-known writer

Imdad Sabiri has published the first of what promises to be a multi-volume series of collections of hajj accounts preserved in the records of his family. The accounts thus offer a very concrete and specific subject presented by a relatively wide range of observers over a considerable period of time.

Perhaps surprisingly, however, the accounts are concentrated in the years of British rule and after. Despite the splendid travelogues written in Arabic in the centuries after the ‘Abbasids, there does not seem to be a continuous genre of travel writing in Muslim societies generally. In the Indian sub-continent, even travellers to the holy places of Mecca and Medina did not write about their travels before the late eighteenth century, except in so far as they recorded visions or wrote treatises while there.[36] In 1787, one Maulana Rafi‘u’d-din Muradabadi (1961 edn), a disciple of the great hadith scholar and reformer of Delhi, Shah Wali’u’llah, performed the hajj and later set down a record of his trip; his is generally taken by later Indian writers as the first such account to have been written from the Indian sub-continent. Only a few pilgrims were to do likewise for the next hundred years. Between 1870 and 1950, however, the pace quickens when several dozen published their accounts. Since then, ever more people have written accounts, probably as many in the last four decades as in the eight decades before.[37] Many more, of course, wrote unpublished letters and accounts, known only to family and friends. Written accounts of the hajj thus seem a modern phenomenon. They share the

impulse and context of other writing that emerges in this period, including travel accounts that range as far as Europe.[38]

*** The hajj accounts as a modern genre

The impulse to write is clearly related to the changes engendered by British domination and western technology, including the printing press, which permitted easy dissemination of writings, and new modes of transport, which permitted easier travel. Writers were discovering new worlds as they were discovering, or creating, new ways of thinking about themselves. The first two Indian Muslims to leave accounts of their trips to Europe, for example, were each from areas of intensive contact with the British in the late eighteenth century, Bengal and Oudh respectively. The traveller from Oudh, Mirza Abu Talib Khan, was a revenue official for the East India Company and wrote — at least in part — with a European audience in mind.[39] The hajj accounts share important characteristics with other new forms of modern literature which are, for example, increasingly conceived as occasions for constituting a persona, a representation ofa self that focuses on individual experiences, perceptions, and feelings, much like the autobiographies that began at the same time. Authors began to present themselves not only as observers but as active participants in what they describe: the hajji and not the hajj takes centre stage.

Many accounts take on characteristics, if not the shape, of novels, including dramatic vignettes of episodes with directly quoted conversations. Some abandon what one might call the built-in pattern ofa pilgrimage account — beginning with the departure, climaxing in arrival at the destined goal, and, on occasion, describing the journey home — in order to structure their story by some other principle.[40] In recent decades many of the most popular accounts have been written by literary figures. Thus the novelist Mumtaz Mufti in his opening apologia makes clear that he is writing neither an entertainment nor a religious treatise, but simply the life story (ap biti) of an “unknown, ignorant, but sincere pilgrim” (not a hajji but a za’ir); he opens with a series of compelling vignettes that show what propelled him, as a sometime secular leftist, to undertake the journey (Mumtaz Mufti 1975: 10).

Studies of Persian and South-east Asian travel literature, including hajj literature, suggest, broadly speaking, a similar pattern. Fragner (1979) finds the earliest Persian memoirs for the nineteenth century to be in fact travel accounts; only in the twentieth century does he find autobiography and what he calls attention to one’s “development and fate” (Werdegang und

Schicksal) as characteristic of either travelogues or memoirs. Matheson and Milner (1984) analysing five Malay texts, identify as one theme an increased emphasis on personal experience in the most recent texts.

The hajj accounts turn out not to be an isolated genre, a continuation of a static medieval form, but rather a genre that develops in ways broadly similar to the modern novel and autobiography. The accounts should be read, moreover, in the context of modern biographies, particularly the biographies of the Prophet Muhammad, a subject that has seen a virtual explosion from the late nineteenth century on. The representation of the central personal symbol of the faith has been increasingly emphasized as Muslim cultures have focused more on issues of individuality and personhood. This emphasis is evident not only in biography and poetry, but in a reformist emphasis on the hadith of the Prophet, and in increased celebration of devotional practices related to the Prophet’s birthday (mawlud). Since the hajj to Mecca often included pilgrimage to the Prophet’s grave in Medina, the accounts themselves may include reflections on the Prophet as well.]10] The accounts should be read as part of an enduring yet shifting constellation of three poles: changes in society generally, changes in concepts of individuality, and changes in the interpretation of central religious symbols, of which two, the hajj and the Prophet, are relevant here.[41]

The hajj does not decline in modern times. In contrast to European Christian pilgrimage, it is rarely called into question. It is a canonical duty, an unalloyed good; it is always better to go. Christian pilgrimage to Jerusalem or saints’ shrines is always problematic, even in centuries when such practices flourished. Similarly suspect can be Muslim pilgrimage to saints’ tombs whose devotees, from Morocco to Senegal to

Baluchistan, may even identify a visit to a shrine as equivalent to the hajj.[42] What questioning there has been of the hajj has not been associated with modern change but with some streams of Sufi mysticism that deplore external duties with no focus on inner purification.[43]

There is, not surprisingly, lively cynicism about a practice so revered. The hajj can be seen as a cover for worldly greed — contacts for smuggling — or honour. But far from diminution, modern decades have seen the hajj grow, not only from South Asia but from all Muslim societies, until today the annual pilgrimage numbers up to two million. As McDonnell (this volume) shows, modern currents of reform have in fact encouraged the hajj and modern transportation has facilitated it. Far from being seen as an alternative to ethical duties or piety, Islamic rituals like the hajj have been seen in periods of reform as essential to both.[44]

By the nineteenth century in Europe, however, travel accounts had little to do with pilgrimage. The image remained as metaphor, for pilgrimage had in fact often given way to exploration and quest.[45] The romantic quest, our most persistent mode of literary travel, made of pilgrimage a new image of a journey into the self, with the antagonist neither the exterior temptation of the Middle Ages nor the external nature of writers like Defoe; it was, instead, identity and selfhood that gave the challenge (Howard 1980: 8). We now take for granted that travel, removing a person from local identities and ties, familiar languages and people, and placing him amid different ways of living and thinking will force at least the sensitive and thoughtful to reassess exactly who they are. As S. Naipaul puts it: “All travel is a form of gradual self-extinction” (1984: 65).[46]

The hajj, however, even if it partakes of adventure, practical account, or inner exploration, remains a pilgrimage in the specific sense of the visitation of the Ka‘ba at Mecca under prescribed circumstances as an essential duty of an able Muslim. “Hajj” is not a metaphor as “pilgrimage” is in English; even if used as a vehicle for a personal quest, the hajj in fact remains and is the structure for whatever experience the hajji creates. That experience, filtered by distance and literary conventions, becomes the remembered hajj of the written account and, for its readers, part of a shared understanding of religious symbols, self-expression, and interpretation of peoples and places.

*** Perspectives on the hajj

Travel accounts in general are richly revealing because they at once purport to describe an objective reality yet in fact reveal the cultural world through which the traveller filters what he sees. Sometimes it is possible to identify some central implicit set of issues that shapes an entire account.[47] Perhaps surprisingly in writings on a core religious ritual, many travellers in late nineteenth-century British India, for example, wrote with a range of imperial

issues close to the surface of their perceptions. Thus Mirza ‘Irfan ‘Ali Beg (1895–6) explicitly wrote to provide useful information and describe interesting events for the Anjuman-i Islamiyya, a voluntary association of Muslims — presumably well-born and educated urban professionals, landlords, government servants, and traders — with whom he was associated. Like many hajjis, he wanted, presumably in all sincerity, to pass on the blessings of a journey like his and to make such a journey easier for those who

would follow. At the same time, however, as a deputy collector in the eastern United Provinces, as high a civil servant as any Indian in the imperial bureaucracy, he was clearly a person who had internalised British concerns for governance and had an identity as a British subject and functionary. He knew English, his tastes were English (from cricket to tea) — and he knew how a government ought to behave.

For him, the significant group in his journey was “Indian Muslim”, a category of increasing salience in the social and political context of his day, and one that takes on new meaning for him in the course of his travels. He looks for Indian Muslims and in a foreign context takes pride in what is special about them. He rejoices in their piety, describing, for example, their unceasing circumambulations and barefoot journeys to Medina. He remarks on their generosity in endowing hospices, gardens, and mosques. In the Haramayn and en route, he readily takes on the role of civic leader — whether acting as examiner at the Indian-founded Madrasa-yi Saulatiyya in Mecca or meeting the pilgrim protectors in Bombay and Jidda to ascertain their role. At every point he reflects on the way in which government should act to provide order, protection, comfort, and cleanliness. He speaks to the imperial government of their responsibilities and addresses himself as well, in the Hijaz, to the Turks. The plight of the poor Indian Muslim — vulnerable, abused, and cheated — is his overwhelming concern. Two years after publishing his Urdu account, ‘Irfan ‘Ali personally translated and revised his journal in English, adding a table of each occasion when he found the situation amiss — his main goal being to influence the government of India to act responsibly to project their Muslim subjects on hajj.

There is more in his account than this. There are also his deep bonds with his friends, his kindness to his servant, his ready response to a holy and learned man he comes to know in Mecca, his cosmopolitan interest in touring, and his congenial relationships with non-Muslims as well as Muslims. However, his particular political perspective is central, and it is enhanced and made public by the very act of writing. Other writers in this period have a somewhat similar experience in the hajj and its recording, notably the Begum of Bhopal who so internalised the British ideals of an “improving” ruler — committed to cultivating good character and installing drains — that she urged the Turks to withdraw and leave the running of the holy places to her (Sikander Begum 1870: 140–1)!

Some of the accounts are shaped by a specific religious orientation. Muhammad Ma‘shuq ‘Ali (1909), for example, described his

experience as a disciple of the great Sufi, Maulana Ashraf ‘Ali Thanawi. His hajj followed residence at the hospice of this saint and was part of the training in ritual fidelity and personal formation that was set for him. Other accounts (for example Abu’l-nur Muhammad 1960) argue a sectarian perspective and use the hajj as a platform for asserting its validity. Yet others are essentially scientific — written like government gazetteers to review history, local customs, the educational system, and the organization of the government (for example, Hasanu’d-din 1935). In each case, to present the hajj is to present a certain kind of self.

Many of the accounts in recent decades are explorations of the self in a more specific sense, looking to the great communal ritual as an occasion to test a person’s place in relation to nothing less than Islam itself and to the Muslim umma. Somewhat like the quest for meaning, for authenticity, outside of one’s own culture — such as we know in some forms of modern European or American travel — self-described secularists embark on the hajj to test themselves, to experience faith vicariously, perhaps in some sense to participate in that faith themselves (Cohen 1979). Thus ‘Abdu’llah Malik (late 1970s) explicitly calls himself a tahzibi Muslim — a cultural Muslim — who goes on hajj reluctantly: and sets out looking over his own shoulder as he learns, he says, a new vocabulary. He struggles to find an intellectual equivalence for his Communism and Islam. He finds himself ever more emotionally involved, but thanks to the structure of the travel narrative, in contrast to a more sustained kind of essay writing, he can savour a thought or emotion (“My eyes were moist and I wept — quite apart from what my beliefs were and what they weren’t”), then just move on. Indeed, the formal structure of the travel account, it has been argued, makes it particularly appealing to a certain kind of modern personality which prefers not to resolve but to sample and explore (Bridgeman 1986). Malik calls his account Hadis-i dil, the testimony of the heart and not of the canonical scripture. One characteristic of the self-conscious intellectual, playing off connection and lack of connection, is to find ways to assert his difference from those around him. One sometime secular leftist, for example, whose story I heard orally in 1985, made a point that in contrast to most hajjis who — as they are told over and over is normal — feel fear in Mecca but love in Medina, his experience was the reverse.

Whether as part ofa re-identification with Islamic symbols or not, recent accounts tend to take as their central theme what one writer (Zainab Kakakhail 1976: 6–7), explaining her list of favourite accounts, calls “matters of the heart” and “inner experiences”. The freshness of hajj accounts, she explains, rests not only

in their documenting actual changes to benefit the reader, but in their showing “the singular and unique experiences”, the individual heart and gaze, that refract the beauty of the Ka‘ba — in every case in a distinctive way. For her, given her emphasis on feeling, it is not surprising that she draws her vocabulary for central religious symbols — God, Unity, the Ka‘ba — from Sufism, distinguishing the hajj from other duties which are ethical in purpose and seeing the pilgrimage “alone as a matter of the heart”, “easing the

pain of separation”, its customs those of the world of passionate longing (‘ishq).

Zainab Kakakhail’s account is not alone in using such language. In the past however, the Sufi tradition was expressed by the insertion of couplets into the ongoing prose account. Indeed, to be able to quote aptly the Persian or Persianate Urdu couplets of the Sufi tradition has long been the mark of a refined and educated person in this culture. The recent accounts seem to demonstrate a convergence of what had been two levels of discourse: a prose discourse focused on external events; and a poetic discourse of passion, longing, and separation offered without comment and not claimed as one’s own speech. Now the poetic language is appropriated as one’s own.[48] As the content changes, the rhetoric and forms of the accounts change as well. If we take the accounts from the late eighteenth century on, they clearly become a continuing genre, building on each other, shaping each other. Do they develop in certain directions as possibilities of the form are simply played out?

Howard (1980), in his study of the pre-Chaucerian accounts of the pilgrimage to Jerusalem, shows how certain “built-in” possibilities of the pilgrimage genre — in that case, irony above all — do develop over time. Do the accounts shape their own landscape, so that the traveller sees through lenses honed through literature? Fussell (1980), in the case of British travellers to the continent, has particularly shown how reading creates the experience of travel; Kabbani (1985) has argued the significance of the European discourse of Orientalism, including travel accounts, in precluding a traveller like V.S. Naipaul from even seeing the Muslim countries which he purports to describe. Writers also learn from those who have gone before, at least in part, the form they must give their account, a form that changes over time — for example, from the conventional self-deprecation in Zardar’s account described on p. 93, to the now obligatory trope of denying that one ever intended to write at all.

Much that is in the accounts is, of course, implicit. Some aspects of the world of writers can be elicited by focusing on the audience, explicit or implied, in the accounts. The writers, while telling their stories, pursue conversations whether consciously or not, of which their written words form largely one side. Sometimes they present, in effect, a response to questions they know would be asked, sometimes they assert the kind of person they want to be known to be — in contrast to some alternative kind of person — sometimes they declare by their assessments and emphases a position in ongoing controversies of a religious or political nature. Sometimes they may not even be conscious that they are writing to a range of concerns, expressed in their societies and internalised in their psyches, shaping the experience which they create as they write.

*** Visual representations in the texts

One way to elicit these themes is to look not only at the words but also at the physical presentation of the texts.[49] One need go no further than the title pages, for example, to see the increased tendency to make the author's experience central and to present each account as distinctive. Figure 5.1 juxtaposes two title pages, on the left that of Zardar Khan (1873) published by the great Hindu Kayasth of Lucknow, Nawwal Kishur. Zardar shared with Nawwal Kishur the Persianate culture of the well-born, often, as in Zardar's case, typical of people employed by the government or a prince. Zardar's book was conventionally entitled Safarnama-yi haramain [A Travelogue to the Two Sanctuaries]. Its lack of colour, its floral border, the medallion for the title, and the inscribed panels top and bottom present the immediately familiar cover of innumerable publications of the day. The top panel replicates in words the balance and symmetry of the page, setting out in the elegant calligraphic style, nastaliq, a two-part rhyming invocation, in Persian, that sets the tone of humility common to publications of the day: "With the help of the Maker of the man [makin] and the place [makan] and the aid of the Shaper of the land [zamin] and the age [zaman]". The author's name does not even appear on the cover, but only in the midst of the formulaic phrases of self-described abjection set out on the opening page.

The jacket on the right appeared some hundred years later (Mumtaz Mufti 1975), a three-colour design, with the one-word title, Labaik ("I am here", the call of the hajji in Arabic as he enters Mecca). The background, yellow-green, significantly deepens to dark green, the Islamic colour par excellence, as field for the black Ka'ba centered at the top. The title is written in a swinging free form so that the first letter, lam, points to the shrine and the elongated final kaf encircles it: the calligraphy thus recalls drawings of the plan of the Ka'ba like those in Figure 5.3. The author's name, Mumtaz Mufti, is boldly written in the loop formed by the downward stroke of the same letter; the name is written at an upright angle that identifies it not with Persian but with the Arabic of the Qur'an and the larger Muslim world. The jacket makes the book look like a novel, and indeed the friend who first mentioned this account to me thought that it was just that — a logical assumption given the poetic title and the reputation of the author as a literary figure.

[[d-f-dale-f-eickelman-james-piscatori-muslim-travel-5.jpg][Figure 5.1 Book covers. (Left) Muhammad Zardar Khan (1873) Safarnama-yi Haramain; (right) Mumtaz Mufti (1975) Labaik.][d-f-dale-f-eickelman-james-piscatori-muslim-travel-4.jpg]]

Like a novel, the goal of this account, and many recent ones, is to convey an immediacy of experience. Over and over, the successful accounts written in recent decades are praised for their making the hajj vivid and present before the reader's eye; the reader identifies with the writer and vicariously lives his experience. Readers' letters prefaced to the publication of Muhammad Riza Ansari's account (1965) for example, praise it for being a veritable cinema and avow that the reader feels he has made the hajj himself. The text itself serves as the hajj. Here Labaik, the title, says, "I

am present” and its calligraphy circumambulates the Ka‘ba just as the author’s words will effect the hajj for the person about to read.

Drawings of monuments similarly suggest significant transitions. Early drawings published in the accounts show balance and patterning (reminiscent of Zardar’s title page) and may incorporate miraculous elements presumed visible once or expected to appear in a time to come. Figures 5.2 and 5.3 show drawings published in Zardar’s 1873 account. Figure 5.2, left, shows his drawing of the site of the miracle of the splitting of the moon, with the split moon also visible; Figure 5.3 shows the Aqra mosque in Jerusalem as well as the pool of Kausar, the bridge, the balance, and the throne of God, all associated with the Day of Judgement, which is expected to begin in that place. He thus includes both visible and invisible reality. Figure 5.3, left, is a drawing of the Sacred Mosque (1880) depicted in a characteristic medieval style, seen from above with the side walls flattened out (Wazir Husain Khan 1880–1). Drawings like this are very schematic and patterned, almost mandala-like in their focus on the centre. The drawing on the right eschews formality for realism, drawing an accurate ground plan of the mosque without attention to walls, domes, and doors, and distinguishing by slashed lines what did not seem of interest before: the distinction between the old building and new additions (Sultan Da’ud 1963). The early author shows himself as part of a long historic and aesthetic tradition; the modern author gives us accuracy and new information.

The charming drawing in Figure 5.4 records the climactic event of the hajj, “the standing” at ‘Arafat (‘Abdu’r-rahim 1915). The simple line drawing and design recall the block prints of northern Indian textiles, as do the sketches of the ladies, who all wear saris. The repetitive camels, tents, and mounted pilgrims form a strong line across the bottom, the Turkish artillery in their modern military uniforms balance the two sides, and the hills provide the top frame for the central focus — the gathering, preaching, and prayer on the sacred hill. An account written in more recent decades would probably include an aerial photograph, rather than a balanced and patterned drawing of this sort.

[[d-f-dale-f-eickelman-james-piscatori-muslim-travel-6.jpg][Figure 5.2 Drawings of sacred places and symbols. (Muhammad Zardar Khan (1873) Safarnama-yi Haramain.)]]

[[d-f-dale-f-eickelman-james-piscatori-muslim-travel-7.jpg][Figure 5.3 Floor plans of the Ka‘ba. (Left) Wazir Husain Khan (1880) Wakilu’l-ghuraba; (right) Sultan Da‘ud (1963) Safarnama-yi hijaz.]]

[[d-f-dale-f-eickelman-james-piscatori-muslim-travel-8.jpg][Figure 5.4 Mount ‘Arafat. (‘Abdu’r-rahim (1915) Safarnama-yi rahimi.)]]

[[d-f-dale-f-eickelman-james-piscatori-muslim-travel-9.jpg][Figure 5.5 Photographs of authors. (Left) Ghulamu’l-Husnain (1935) Safarnama; (right) Saba Mustafa (1979) Paharon ke daman men.]]

Finally, Figure 5.5 offers two photographs of authors. Not many authors provide photographs, perhaps fearing to offend the sensibilities of those who find photographs suspect or who might think the author vain. But even from the limited number of photographs available, the contrasts are again suggestive of the increasing tendency to focus on what is individualistic. The photograph on the left shows a venerable figure dressed in ihram (Ghu’lamu’l-husnain 1935); the second, a wonder-struck woman, wife of a Madrasi army officer (Saba Mustafa 1979). Her photograph is meant to communicate the personal emotional quality of the hajj - the theme that her text as a whole is meant to demonstrate. The earlier photograph, in contrast, is as much a generic representation of a hajji as a photograph can possibly be.

*** Conclusion

Travel to Mecca is travel of a very particular kind. To go to Mecca is to go home, to return to one’s ruhani watn.[50] To go to Mecca is to perform an act of unquestioned value. Not only is the goal clear, but the place, in contrast to the destinations of some kinds of travel, is thoroughly known by vast resources of the culture in story and devotional song — now reinforced by techniques of reproduction and communication that make the Holy Places ever present.[51] Moreover, the journey moves on the invisible lines which believers create by every prayer, posture at sleep, and burial in the grave; on the day the hajjis perform the ritual sacrifice, fellow Muslims everywhere perform their sacrifice and all are linked world-wide in celebration of the feast. By undertaking the hajj, the pilgrim in principle affirms his individual responsibility for obedience to God and claims his place among the community of faithful people. However much the pilgrim seeks in his experience and in his writing to explore a unique and self-conscious self — the theme, as suggested, of many of the recent accounts — his undertaking must be in some tension to the normative programme of the hajj, and of all of mainstream Islam, to hone himself to the prophetic model,

the person of the Prophet Muhammad, in whose footsteps on this occasion he can literally walk.

Such a context suggests that we have more than a simple mirroring of European individualism explored in alien settings as we trace changing patterns of self-representation in the hajj accounts. If a person is “finding himself” he is doing so in a crowd, following a ritual programme of dress and behaviour meant precisely to obliterate the markers that make a believer distinct by class, race, or region. The accounts, even if

imitative of European travel writing and made salient by the socio-political change engendered by European technology and domination, are written in the context of interaction with the core tradition of Islam.

All this would be true of any Muslim account. Those from South Asia share their own characteristics — characteristics rooted in the peculiarly plural character of Indian cultures and in the long experience of colonial rule. That rule provided a range of alternative values, so that indigenous cultures became self-conscious and, in Geertz's (1968) phrase, oppositional. At the same time, the very idiom of British rule encouraged religious identities in a plural society. These experiences shape all forms of self-statement by South Asian Muslims, but accounts focused on such central symbols as those represented by the hajj present themes particularly suggestive of the specific issue of how being Muslim has been experienced and conceived. A Muslim identity has not been the only one significant to those we label South Asian Muslims, but it has, assuredly, been an important one. In the accounts we see something of the shifting content of that identity as well as its relation to competing and complementary strands — of occupation, moral formation, spiritual quest, gender, and territoriality. The texts let us hear people speak, telling us, in a wide variety of ways, what kind of people they are and how they think of Islam, the places they go to, and the people they meet.

*** Acknowledgements

I am grateful to the John Simon Guggenheim Foundation for support during 1983–4 as well as to the American Institute of Pakistan Studies and the American Philosophical Society for grants to support travel, all of which enabled me to collect materials and undertake preliminary work on this project. I returned to the project in Autumn 1987, thanks to the Davis Humanities Institute which provided released time from teaching and the company of excellent colleagues.

[32] For an excellent introduction to these topics, see Lewis (1971). On administrative issues, see Long (1979) and Roff (1975, 1982). On the hajj as ritual see Roff (1985); von Grunebaum (1951); and Partin (1967).

[33] As will be clear in the discussion that follows, by South Asian I limit myself primarily to those written mostly in Urdu, a few in Persian, a handful written in or translated into English.

[34] I currently have in hand, or have made use of, almost 150 accounts. I have found these accounts in London (British Library, India Office Library), Lahore (Dayal Singh Trust Library, Oriental College Library, Punjab Public Library, and Punjab University Library), Islamabad

(Islamic Research Institute [IRI]), and the libraries of the University of California. I am grateful to the staffs of all these libraries and to Dr Muhammad Khalid Masud of the IRI for their generous help. I have also acquired books in shops in Lahore and Delhi as well as an excellent collection of accounts from old book shops in Hyderabad, India, thanks to the skilled help of Dr Gail Minault. Dr Michael Fisher kindly provided an account by a Keralite; Dr Francis Robinson, one by a Farangi Mahali. I have not yet had an opportunity to consult libraries in India where many more accounts are presumably to be found.

[35] This “sharif culture” is evoked for the late nineteenth century in Lelyveld (1979), Chapter 2.

[36] See Pearson (1986, 1987a, 1987b). Pearson suggests that as many as 10,000 pilgrims a year may have undertaken the hajj during the period of Mughal rule. The best-known example of early writing about experiences in the Hijaz is that of Shah Wali’u’llah (1730), the Fuyuz al-haramain, a collection of his visions.

[37] This assumes that those I have identified are in proportion to the total written.

[38] I am grateful to Dr J.P.S. Uberoi for reminding me of this and for presiding over a lively session on my work at the Sociological Research Colloquium, University of Delhi, on 11 December 1987.

[39] The writers are Sheikh I‘tisam al-Din from Bengal and Mirza Abu Talib Khan from Lucknow as noted in Lewis (1982).

[40] Howard (1980), analysing the pilgrimage literature of pre-Chaucerian unknown pilgrims to Jerusalem, argues that the inclusion of the return journey — exemplified by a monks account that touchingly ends with his welcome by the monastery dog — specifically points to an account that focuses on personal experience more than on the externals of the journey.

[41] For excellent material on the whole range of expressions related to the Prophet in the modern period, see Schimmel (1985).

[42] See Brown (1975) for a discussion of eleventh- and twelfth-century AD changes in social structure, as communities became less coherent and intense; in relationships; and in conceptions of the supernatural “as an upward extension of the individual”. Colin Morris (1972) delineates a new focus on inwardness in the twelfth century AD as shown in sermons describing personal experience, lyric poetry, ritual injunctions to confession with a focus on

intention, and more personal portraits. New social roles and a new focus on personal relationships were the context for new interpretations of religious symbols, including a focus on the sufferings of Christ and devotion to him and a new conception of the Virgin. See also Bynum (1982). Other periods have, of course, seen this complex interplay in changes in society, religious symbols, and self, but this period is one that has been particularly well studied.

[43] This is the case for the visit to Touba on the part of the Mourides of Senegal as it is for Demah on the part of Javanese. It is apparently the case also for the shrine of the Merinid sultan Abu Yusuf (AD 1258–86) in Rabat where tradition holds that seven circuits of the passageway around the mihrab gives merit equivalent to the trip to Mecca (Ellingham and McVeigh 1985). The contemporary Zikri sect of the Baluch, studied by Dr Akbar S. Ahmed, identify a local pilgrimage shrine in Makran with similar merit.

[44] Thus the eighteenth-century Punjabi poet Bulhe Shah, celebrating the love of Hir for Ranjha, the type of the soul’s love for God, sang:

The hajji go to Mecca, world by world,

My Ranjhu is Mecca for me.....

The hajji is within

The ghazi is within.....

I have become a fool.

The hajjis go to Mecca.

We must go to Takht-i mir [the birthplace of Ranjha].

This is the road to Mecca.

(Provided by Dr Denys Matringe, Ecole des Hautes Etudes en Sciences Sociales, Paris, June 1986)

In his poem, Bulhe Shah recalls themes that go back at least to Junaid (d. AH 298/AD 919) in insisting on an inner component to the external trip.

[45] For the “reformational” quality of Islamic ritual, see Graham (1983).

[46] This was true whether for well-known figures like Byron or a traveller like Mrs Fanny Parks (1850) who travelled in India in the 1820s and 1830s. When Mrs Parks returned to London she concluded her two volumes by hanging up, she wrote, her long staff and stripping the scallop shell from her hat — the medieval emblems of the pilgrim to the shrine of Santiago in Compostella (2: 496).

[47] Naipaul begins his published account of a trip by recalling these opening words of his notebook: “All journeys begin in the same way. All travel is a form of gradual self-extinction.”

[48] In studying European travelogues to Latin America, Roberto Gonzalez-Echevarria (1987) is able to identify what he calls a shifting “hegemonic discourse”, so that travellers in one era, for example, will speak to legalistic concerns and use a legalistic vocabulary, travellers of another period will shape their account by science.

[49] For an analysis of the interplay of these two levels of diction in another context, see Abu-Lughod (1986).

[50] I am grateful to Dr Catherine Asher for pointing this out to me and for ably helping me with her art historian’s eye, to reflect on the visual materials presented here.

[51] This is the phrase used by Gilani Kamran (1978). His is one of the few scholarly works that surveys the Urdu hajj accounts, and I have benefited from it as from the personal helpfulness of Professor Kamran.

[52] Today the climax of the hajj is transmitted by television satellite and watched live throughout the world. Calendars and art of all kinds make the image of the holy shrine the most familiar distant building of many Muslims. Pakistan television, like the television of many countries, transmits special programmes during the hajj season, including a six-part mini-series, which I viewed in 1985, to prepare intending pilgrims for their trip.

*** Scale

Over the past hundred years, dramatic change in the scale, conduct, and composition of the Malay hajj has occurred. Over time, these transformations have modified how Malay pilgrims have experienced the hajj. In the 1880s, an average of 2,500 Muslims from the Malay States performed the hajj annually. This number doubled by the 1920s, and, since the mid-1960s, it has risen to 9,130 — an increase of approximately 400 per cent. The most dramatic increase has been since 1970. In 1982, approximately 25,000 pilgrims from Malaysia participated in the hajj.

Significant dips in this general trend can be attributed to major world events, while minor fluctuations have normally been related to internal economic factors.[52]

The growth in the numbers of pilgrims cannot simply be due to population growth. Although it is impossible to determine the percentage of pilgrims within the Malay Muslim population at any given point, the average numbers of pilgrims in relation to the total Muslim population would appear to indicate that the increase in pilgrimage numbers is due to population growth. However, if we examine Malay pilgrims as a percentage of the Muslim population of hajj age (35+ years), it becomes clear that the percentage performing the hajj is increasing at a faster rate than the hajj-age segment of the Muslim population.

With respect to world-wide pilgrimage attendance, trends in Malaysia appear to be representative. In the early 1900s, 80–90,000 pilgrims annually performed the hajj, with more than 800,000 performing the hajj today. Hajj attendance has steadily increased since the 1950s, when it averaged 100,000, and has made major strides following the 1973 oil embargo, which heightened Saudi Arabian prestige. Indeed, an augmented position in the world of nations has enhanced the Saudi position in the eyes of Muslims. It can be argued that this heightened prestige has enabled Muslims to

feel safer and more secure in the Saudi ability to manage the hajj, and has enhanced the perception that there is a single centre. Funds from oil have also allowed pilgrimage to be better managed at the Saudi end, lending reality to the pilgrims' sense that a more powerful country can afford better protection and facilities.

The number of overseas pilgrims has also increased.[53] It rarely reached 100,000 before the Second World War. Today, more than 300,000 overseas pilgrims perform the hajj yearly. Malaysian pilgrims have formed 7.4 per cent of the total of overseas pilgrims. Indonesians have formed 15.2 per cent, and Indians 20 per cent before the creation of Pakistan, and 10 per cent since 1947. Although real numbers of pilgrims from Indonesia and India and their percentages of the overseas pilgrims are greater than Malaysia's, we know that their Muslim populations are also substantially greater. If we examine the above percentages of overseas pilgrims in relation to the respective Muslim populations of Malaysia, Indonesia, and India, we discover that Malaysia has sent twelve times as many pilgrims from its Muslim population as Indonesia, and ten times as many pilgrims as India before 1947. Since then, Malaysia has sent fourteen times as many pilgrims as has India.

*** Conduct

Since the 1880s, the conduct of the hajj from Malaysia has been completely altered. From initial control by British colonial officials with only a peripheral interest in it, the hajj from Malaysia has come to be the sole concern of large numbers of highly-trained Muslim managers in Saudi Arabia and Malaysia. Because hajj management was previously tied up with the stability of the British Malayan colonial government, its main concerns were with the health of pilgrims and the possibility of their acquiring ideas subversive to the empire while in the Hijaz. Today pilgrimage is managed as a tool of national economic development and nation-building within Malaysia. From an initially haphazard group of directives, pilgrimage management progressed in the colonial period to a system attached to merchant shipping and police intelligence,[54] a system with little impact once British ships docked in Jidda. Today, however, the regulatory system encompasses every aspect — from the decision to perform the hajj, through the entire journey, to return to the point of origin. The Malaysian government agency, Lembaga Urusan dan Tabong Haji (LUTH) [The Pilgrimage Management and Savings Corporation], regulates when Malaysians go, how they may go, and how much money they may take. It organises such practical matters as registration, visas, passports, transportation, and medical and welfare care (LUTH Annual Reports 1971–82).

[[d-f-dale-f-eickelman-james-piscatori-muslim-travel-10.jpg][Figure 6.1 The architects intended the design of the headquarters building for LUTH (the Pilgrims' Management and Savings Corporation), Kuala Lumpur, to suggest that saving for the pilgrimage can also serve to channel funds into local enterprises "lawful of Islam". (Photography courtesy of LUTH, Kuala Lumpur.)]]

Thus, in recent years, the pilgrim's experience in practical terms has been substantially altered. Until the early 1930s, the hajj was a physically unsafe, insecure, unsanitary journey of long duration, in cramped and squalid conditions. By the end of the decade conditions had been upgraded substantially, and the journey was more organised, safer, and easier — especially in those areas amenable to Malayan governmental control such as shipping. However, little could be done to improve medical and sanitation conditions within Saudi Arabia or to mitigate extortions by mutawwifs (shaykhs who act as agents for pilgrims).

Transportation, welfare, and medical facilities have now been vastly improved, and the time and scope of the journey have been greatly reduced. Problems remain but these are relatively minor. The modern pilgrim travels in comfort by air, is supervised by Malay officials throughout the journey, and returned home promptly one month after departure.

In statistical terms, these improvements are mirrored by vast reductions in death and destitution figures. Destitution was never particularly high for Malays, who were long considered an affluent element of the hajj population. In the 1880s, the destitution rate for pilgrims was about 0.85 per cent. Since the Second World War, destitution is claimed to have been completely eradicated through increasingly severe

government measures to restrict pilgrimage to those who are financially able to make the journey without jeopardising their own, or their families', financial security. Death rates have also declined dramatically since statistics first became available in the 1920s. At that time, rates fluctuated widely, peaking at roughly 13 per cent. By the 1950s, highs reached only 8.8 per cent. In the past fifteen years, the highest rate has been 3.7 per cent, and rates more often range between 1.5 per cent and 2 per cent.

Founded in 1969 as a division of the Ministry of National and Rural Development, LUTH has shown marked success in its welfare, financial, and developmental goals. It has particularly mobilised savings in the rural areas. Savings in kind, as opposed to cash, have greatly decreased, and selling land and other items to participate in the hajj has become a thing of the past. In addition, LUTH, through a policy of erecting large and prominent buildings in each district to underscore its solidity and prestige (and that of the hajj), has given visible proof that Muslim Malay needs are being addressed at the national political level. LUTH is thus playing a role in "Islamising" the peasantry and altering their perception of economic change.

*** Composition

An analysis of who participates in the pilgrimage is important for understanding the hajj as an agent of personal social mobility and change within Malay society.

In the past century, the social groups participating in the hajj have varied. In 1900, a typical pilgrim was a wealthy member of the traditional elite,[55] male, and elderly. By the 1920s, newly monied but not financially stable elderly peasants made up the bulk of pilgrims, with the increasing involvement of students and the emerging middle-class intelligentsia and elite. These trends were exaggerated in the next decades as the three groups — the traditional religious and secular elite; petty bureaucrats and their student sons; and elderly pensioners and peasants — became more clearly definable. In addition, women and younger students increasingly made the journey, as did pilgrims from urban centres. Within individual Malay states, rural areas experiencing rapid development appear to have sent the most pilgrims, whereas the poorest areas, least involved in economic and social change, continued to send the fewest pilgrims. There began to be evidence of urban pilgrims. The beginnings of a shift from the predominance of rural pilgrims to that of urban pilgrims reflected the general shift of the middle class from a rural to an urban setting — the son of a penghulu (lesser Malay chief or district level state bureaucrat) or a farmer, for example, who became a teacher or bureaucrat in the capital. In the process, rural middle-class expectations and symbols of legitimacy moved to the cities as well.

After the Second World War, these trends continued, and entire families began to be identified as middle class through the title hajji. As Malay power shifted to an urban setting, the hajj increasingly became urbanised. Indeed, as costs rose,

the hajj became prohibitive for all but those whose participation in the cash economy was already substantial.

Since the 1960s, pilgrims have become equally rural and urban and predominantly middle class, middle aged, and relatively affluent. Most have ancestors who were involved in the hajj, and it is most popular among the new bureaucratic elite. It is a journey undertaken with spare funds and spare time, and, following its completion, there is no return to poverty as in previous years.

Half of the pilgrims today are women. Before the 1920s, there is no reference to women performing the hajj, but in the late 1930s,

the numbers of women began to rise as it became more common for the peasant elite to take their entire families. A few wealthy women, having outlived their husbands, seemed to have performed the hajj on their own. By the mid-1940s, there are far more references to women performing the hajj. Some had undertaken the journey previously, while a number were widows whose husbands had previously gone to Mecca; most were the daughters of hajjis. These women tended to be younger than their male counterparts, and were largely from Kelantan. In the post-war period, as more families undertook the journey, the number of women increased, and it became popular for pregnant women to perform the hajj in the company of their husbands. In 1960, male and female participation drew even. Since then, female participation has markedly increased, exceeding male participation by 5 to 6 per cent. Only in Selangor are there still more male bakal haji (Malay term for an individual preparing to perform hajj).

*** Intellectual change

From the last decades of the nineteenth century until the second decade of the twentieth, the pilgrim spent long months in travel and often years in Arabia. He had a great deal of interaction with the Jawah (members of the Malayo-Polynesian language group resident in Mecca) community, and with teachers from among them and from a variety of Arab countries. He also had time for prayer, study, and induction into Sufism, generally choosing the Naqshbandi tariqa (order or brotherhood).

It is likely that he had been influenced by the Islamic revival then evident in Cairo and Mecca, through direct exposure, friends made on the journey, or literature disseminated from Singapore. Even had he remained for the minimum period in the Hijaz, he would have been exposed to the Islamic revival at work in Arabia — the revolutionary result of pan-Islamic and modernist trends — and to Wahhabi teachings. When combined with exposure to the hundreds of thousands of Muslims gathered together from all over the world and to anti-

imperial propaganda, the Malay pilgrim may well have resolved to engage in further involvement in tariqas,[56] and co-operation with the vernacular-speaking, educated elite once he returned home. In turn, the enhanced status and influence of hajjis within the local community enabled these new ideas to gain wider validity and dissemination at the village level.

By the 1920s, the average stay was about six months and it was becoming more common for pilgrims to reside in Mecca permanently after retirement. Contact with the Jawah was strong,

exposing the pilgrim to much of the political and intellectual turmoil that marked these years. Between 1919 and 1923, the troops of ‘Abd al-‘Aziz ibn Sa‘ud, extending their hold throughout Arabia, left only Mecca and Jidda to their rivals. Yet even in these settings Wahhabi religious influence was gaining ascendance. A pilgrim would have been keenly aware of the new Wahhabi restrictions on his worship and actions in Medina, and to some extent in Mecca, and of the intensifying violence and extortion associated with venturing outside of Jidda.

From the Malay pilgrim’s contacts with the Jawah community, his Malay-speaking mutawwif, and his mosque teachers, he would have learned of the growing anti-colonial and pan-Islamic movements in other Muslim countries and of Islamic modernist and reformist ideas. He may also have heard something of the increasing discontent of the Muslim peoples under western domination and of western ideas of democracy and self-determination (Roff 1974: 32–90).

In the period 1924 to 1945, both the number of Jawah and their contact with Malay pilgrims increased. Annual Pilgrimage Reports by Malayan colonial officers often noted the large number of pilgrims who yearly choose to remain several seasons or to retire permanently in Mecca. The stable Jawah population hovered between 500 and 600. Intellectual trends in the Hijaz, such as anti-colonialism and Wahhabism, were in general an intensification of those evident in earlier years, heightened by newly-won Saudi control of the Hijaz and by Wahhabi dominance.

Pilgrims had different levels of involvement with their surroundings during the hajj. The casual pilgrim would have had far less involvement in the issues of the day than an intellectual or a member of the traditional elite, interested in mixing with the leadership of Saudi society. Someone such as Hajji Abdul Karim,[57] the leader of Kampong Jawa, a village near Klang in the Malay State of Selangor, who remained to study in Mecca for several years, would have become far more involved with these intellectual trends than those remaining for only six months.

Since the end of the Second World War, the length of the hajj journey has shortened. Time and contact have been gradually reduced, so that the pilgrimage is now a controlled, four-week, packaged journey. The Jawah have decreased and cannot be augmented by new arrivals due to modern Saudi immigration restrictions. At the same time, there has been an expanded predisposition among Malay pilgrims to absorb the symbols, feelings, and ideas prevalent in Arabia. Pilgrims have been previously exposed to the beliefs held by the centre through the media and are

re-exposed through such vehicles as the annual pilgrimage address given by the reigning Saudi king and through identification with the larger Muslim community of which they are keenly aware, even if involvement can be only superficial. In the pre-independence period, Malay nationalism was especially important and had certain affinities with Arab nationalism. Today, in Saudi Arabia, the pilgrim is confronted by a powerful Muslim state — conservative, moderate, modern, and opposed to radical tendencies within Islam. Although the bakal haji does not study in Saudi Arabia, he studies before the hajj and already understands a great deal about the centre of the Muslim world through the media. What is transferred now is a predisposition to be a good Muslim by emulating Saudi Arabian orthopraxy and Saudi Arabian political moderation.

*** External change

Before the late 1930s, the length of the journey, the advanced age of the pilgrims, and the extreme physical deprivations and hardships encountered allowed the returned pilgrim to bear little resemblance to the man who had departed. He was physically and financially exhausted and often returned home to a life spent in dependence on family and neighbours — if he returned home at all. This pilgrim had saved all his life for this journey and often accomplished it by selling his land or his home. In expectation of death, or at least of a lengthy absence followed by change significant enough to preclude return to his former life, the pilgrim paid his debts, settled old scores, and put his worldly affairs in order. Pilgrimage was often undertaken at particular life junctures — after finishing school, before marriage, upon retirement, or with the approach of death. Before departure, he consulted a bomoh (traditional Malay medical practitioner or curer) to determine an auspicious day and time for departure, gave a khenduri (communal meal) to bid goodbye to his friends and to pray for a safe journey, and, relatively confident that these would keep him from harm, did not look back as he left his home. A large crowd accompanied him to the wharf.

The returning pilgrim was severely changed. He was likely to be dressed in new Arab garments, and his physical appearance altered by the privations of his lengthy absence. He would have been addressed with the prestigious and respectful title of hajji or even shaykh (if he had purchased a license to recruit pilgrims). As the new hajjis — who had formed powerful bonds through shared experience under

strained circumstances — made their farewells to one another, they would have addressed each other by their new

Arab names, giving the waiting crowd of relatives further reason to wonder whether these were in fact the same people seen off a year earlier. Back in the village, the pilgrim would have been welcomed home by a khenduri and honours. If he had sold his land to finance the journey, he would now have to live on charity or become an itinerant religious wise man, communally supported by virtue of his new status.

In succeeding years, the Saudi Arabian and Malayan governments have worked to reduce the time spent on the hajj, to improve its conditions, to circumscribe movement within Saudi Arabia and contact with non-Malays, and to lessen the financial hardships associated with the journey. Today, the pilgrim leaves his old life only briefly and returns physically and financially unchanged. The physical changes engendered earlier as outward symbols of internal change no longer exist. He saves through LUTH and rarely sells anything to make the journey. He has also received no new concrete knowledge and has little chance to absorb alien experiences or enjoy prolonged contact with Muslims from different backgounds. He is isolated among Malays and significantly buffered from the alien environment.

None the less, his preparations today are more elaborate. He attends pre-hajj classes, and performs extra prayers and fasts. Registration procedures force him to begin thinking about and planning for the journey a year in advance. New and elaborate travel wardrobes are sewn. As departure nears, a khenduri is arranged at which friends and relatives often give monetary gifts, and weeks are spent visiting friends in neighbouring towns. While preparations are lengthy and elaborate, they no longer include putting one’s worldly affairs in order in anticipation of death. Rituals associated with long and unsafe journeys are rarely performed and consultations with a bomoh are less usual for the average pilgrim. However, the mystical associations with Mecca is still evident, even among well-educated, modern, urban-dwellers.[58]

As in the past, a large crowd gathers to see the pilgrim off. On his return, a brief four weeks later, he wears Arab clothing, may have a beard, and often bears a new Arab name. Hajji is today an official form of address and is inevitably adopted as part of the individual’s formal name. A woman’s head is usually covered once she has become a hajja. Although returned pilgrims may later revert to Malay dress, a small beard for men and a head covering for women may be retained. These remain as external signs, although physical, financial, and intellectual changes have greatly lessened in recent times. In a society where it is increasingly important, politically and psychologically, to be identified as a good Muslim, these outward symbols of having been on the hajj and achieved religious status are increasingly desirable. The pilgrim is seen as the dispenser of berkat (blessings) and is feted and visited for several

weeks on return. Although many more persons in a locale have performed the hajj than was previously the case, hajjis still receive great respect, even though outward manifestations of this often depend on the individual pilgrim’s socio-economic status.

*** Internal change

Perhaps the most elusive aspect of this transformation is inner, personal change, which was assumed by others to result from the journey and entailed more than the respect or admiration attributable to association with an elite activity. That it was assumed an individual became internally holy and religious and somehow a better person is clear from his elevation within society, not just as a more worldly person who had travelled beyond the village confines, but as a wise and holy person, sanctified by his experience, and therefore possessed of both the duty and the power to influence the thinking and deeds of other villagers.

Of the period before 1920 we have little indication of how the individual felt as a result of his experience, and no sense of his expectations. There were intimations that a person may have undertaken the hajj in thanksgiving, especially following an illness. Hajj was also associated with atonement, a linkage strong enough to have been transformed into legal precedent and accepted by British courts. To sentence a criminal to perform the hajj was seen to serve the same rehabilitary purposes as a prison term.[59] Moreover, we are told by observers such as Hurgronje (1931) that pilgrims are emotionally affected by such sights as the Masjid al-Haram. Written accounts of the hajj presented the experience in terms of an outward experience and of kerajaan (symbolic nationhood or kingdom), not in terms of personal, inner change. However, unanalysed emotionalism was recorded, as was association with magic and berkat.

By the mid-1920s, there began to be evidence of the internal transformations associated with the hajj that the individual had undergone — partly because this was the first period to produce detailed, first-hand accounts of the pilgrimage process. We learn that the hajj was associated with both real and symbolic death, and real and symbolic rebirth. Hj. Abdul Majid bin Zainuddin, the first Malay Pilgrimage Officer (MPO) who served from 1924 to 1939, attested to the auspiciousness of death in the Holy Land while in a state free from sin as a result of the pilgrimage rituals (see Abdul Majid 1926).

The pilgrim prepared himself as if he expected to die, and performed rituals marking important junctures in the Malay life cycle. His journey cleansed him of the sins of his old life and prepared him for a reformed life — accounting perhaps for his acceptance as wise and holy upon his return.

By the late 1930s, and increasingly following the Second World War, pilgrims seem to have become concerned with the prestige they would gain from the journey. Harun Aminurrashid, a prominent nationalist and teacher at the Sultan Idris College, in his hajj account (Matheson and Milner 1985: 25–6), is clearly concerned “for the status gained within Malay society by undertaking [the] hajj”, and with the title “Hajji” or “al-Haj”. Hajj is seen as a symbol of “Muslimness” and “Malayness”, which were becoming increasingly inseparable, but he also describes it as an interior experience. Internal expectations of change appear to be associated with social mobility, cultural and political identity, prestige, and a sense of belonging.

The analysis of data from a survey, combined with in-depth interviews that I conducted between 1981 and 1984, has allowed internal expectations and transformations to be better apprehended for a wider range of pilgrims.[60] The hajj seems no longer to represent simply an external juncture in a pilgrim’s life. It is not undertaken at any particular time relative to the human life cycle. However, it appears increasingly to be related to an internal spiritual juncture that occurs at a point when a variety of social, political, and personal pressures make the individual susceptible to government encouragement of a journey that would reaffirm cultural identity. Interviews indicate that people have very definite expectations with respect to internal and external changes in their lives as a result of undertaking the hajj. In general, they expect to be closer to Allah, to be more knowledgeable about Islam, to be a better person, and to be honoured within their community upon their return. They feel the journey will free them from vices and negative emotions (impatience, jealousy, hatred), help them to be less materialistic and pray better, and enable them to give a better example to the community. The status that will accrue to them is also important, as evidenced by the high interest that they show in the outward symbols of their inwardly-altered condition, such as: the title “Hajji”; Arab clothing; facial hair; and change of name. In essence, hajjis expect to be perceived by others as better Muslims, to behave as such, and, in fact, to be better Muslims.

Pilgrims also discuss an intense feeling of belonging to a community of Muslims. The communal bond developed during the journey is still strong, although perhaps it is now perceived more in relation to the Malay community. Because the hajj is performed within an almost wholly Malay context, shepherded and buffered by Malay officials, it is seen as a shared national experience as well as a religious one.

*** Personal change: motivation, mobility, and Muslim self-identity

The fact that, in some basic sense, individuals conceive of the notion to perform the hajj because they are enjoined to do so by Qur’anic prescription (22: 91) does not explain why some individuals choose to do so and some do not (see Eickelman and Piscatori, Chapter 1 of this volume). It does not explain why even those not enjoined to perform the hajj (individuals who are financially or physically unable to endure the journey) often feel compelled to embark, or why pilgrimage to Mecca is particularly

popular among the groups described during certain historical periods. It offers few clues as to why individuals choose to perform the hajj at a particular time in their lives. Motivational patterns are involved with both “ability” and “desire”, and increasingly with government manipulation of these factors.

In the decision to perform the hajj, ability must coincide with desire. In the nineteenth century, this desire was fostered by contact with Singapore — the archipelago’s focal point for Islamic intellectual activity and information disseminated from the Middle East — by a growing cultural insecurity in response to increased alien immigration; by the general expansion of colonial domination over Malay life; and by the possibility of upward mobility upon return from the hajj. Desire, economic ability, and increased opportunity would generally have been present in a man who already enjoyed some status in the community and wished now to add religious status to his financial, educational, or political status in order to legitimise it. In effect, the hajj made those already respected and part of the power structure respected in a new way.

As vernacular education increased, Islamic modernism gained a wider audience, including a dissatisfied new elite, which, though having emerged from the upper levels of the peasantry, and newly monied, was unable to put its new skills to work in jobs commensurate with its new status. In these circumstances, the hajj acted as both a step in the search for increased social mobility and a form of rebellion in response to the cultural threat posed by foreign domination and alien immigration. Indeed, the importance of Islam and of the hajj as a symbol of “Muslimness” was growing as a sign of Malay power and Malay cultural identity.

For the traditional elite, the hajj continued to reaffirm traditional

status in the early decades of the twentieth century. For the peasant who undertook the hajj, his status was increased in a rural setting. His short-term economic position may have suffered, however, as he generally sold his land before the journey and returned penniless. For the new intellectuals, whose desire to undertake the hajj and to increase their status was affected by expanded educational opportunities provided by the colonial government without matching opportunity, and by an increasing threat to an intensified Malay-Muslim identity, the hajj was coming to symbolise and affirm middle-class status.

By the mid-1920s, students returned to a new range of jobs as a result of skills acquired abroad and of their newfound aura of Muslim orthodoxy. Many who went to the Middle East for education joined, upon their return, Islamic reformist or modernist groups (Roff 1974: 56–90). They became part of Malaya’s Middle-Eastern-educated intelligentsia, for whom the search for identity was involved with pressures associated with Malay nationalism. Those who, through education and jobs, were already part of the emerging middle class were

legitimised by the hajj experience within an expanding setting as the scope of Malay power broadened. For the first time, elderly pensioners and peasants were able to perform the hajj en masse, the former owing partly to governmental subsidy. These grants were not numerous and were provided on a case-by-case basis to individuals deemed “deserving” via a screening process. Criteria changed over the life of the system, which began in 1921 and seems to have continued through the 1950s. It was initially a state, rather than a national, system and was generally confined to employees of the individual state and, later, of the national government. Beneficiaries of this system, and of the general economic prosperity of the period, returned to an enhanced status within village life, and participated in the formation of a Malay economic middle class.

The post-war, pre-independence years saw a wider scope for personal mobility after performance of the hajj. This was due to the wider involvement of Malays in government, growing nationalist aspirations, and the expansion of both the secular and religious bureaucracies in response to the need for Malays to widen their role within “the Contract” — the multi-party, multi-racial agreement that led to Malaysia’s independence from Britain in 1957. Evolution towards independence increased the power and prestige associated with religion and the role of Islam in society, and of hajjis in particular, as Malay participation in government intensified. The association of wealth and the prestige connected with religion began to take on new importance as a way not only of becoming middle class, but as a means of validating that achievement. It became possible to achieve upper-class status through political and economic power rather than birthright, if that power was validated by its linkage with sources of traditional prestige — religion and the Islamic centre — and thus seemed moral. Pilgrimage legitimised wealth and, while they had been associated for centuries elsewhere (see El Moudden, Chapter 4 of this volume), religion, commerce, industry, and politics now seemed to go hand in hand in Malaysia as well.

Since the 1960s, the hajj has continued to provide traditional rural social mobility. In addition, it provides access to power for the bureaucratic middle-class elite, especially for those whose economic and educational prestige is already intact. While government workers are by no means the majority of bakal haji, pilgrims are well and increasingly represented in the top echelons of the civil service. In the 1980s, not only is it popular for top echelon bureaucrats in government and public corporations to perform the hajj, but it is increasingly popular for their immediate juniors — having seen the Director-General or Minister, on his return from Mecca, placing “Hajji” or “al-Haj” on his office-door nameplate — to perform the hajj themselves. The hajj performance by top government officials during political crises at home is also becoming increasingly common.

While it is difficult to tell whether individuals perform the hajj to achieve power or whether people rise to power who have gone on the hajj, or who are of the type to have the predisposition to go, it is evident that the hajj has become a part of the national power configuration. In recent years, the ruling Malay party, the United Malay Nationalist Organisation (UMNO) has accepted that the hajj, as a symbol

of orthopraxy, must be encouraged if it, and the government, are to succeed within the Malay community. The hajj is particularly encouraged in order to stem dakwah-type fundamentalism, and in begrudging recognition of the powerful pressures and forces at work in modern Malaysian society that have allowed the dakwah movement to prosper (Nagata 1984). As the secular elite that inherited independence a quarter of a century ago is being transformed to meet these new political and personal challenges, seeming to be a better Muslim has become synonymous with being a better Malay and citizen. “Muslimness” and “Malayness” have become intimately connected now, whereas, in the 1880s, Islam was but one element in a traditional Malay prestige system.

Given that the hajj has become fashionable among the secular, urban, middle class — who are coming to see Islam, prestige, and

upward mobility as going hand in hand — we see that an individual can view himself as a member of several groups at once. He can be Malay, Muslim, and a PhD. He can perhaps remain attached to certain concepts associated with his animist past while being a competent, well-educated lawyer or politician. These simultaneous identities may not exist in any hierarchy. Rather, ideas, decisions, and reactions may depend on which identity is predominantly operative in a given situation. The identities appear, moreover, to co-exist without being perceived by the individual as contradictory.

*** Social change: becoming “more” Muslim

In the late nineteenth century, growing numbers of more orthopraxic Muslims, exposed to modernist ideas, and the increasing influence of these prestigious persons over community life, planted the seeds of later political, economic, and religious changes. The vehicles for dissemination of these currents of intellectual change were: the intellectual life of Cairo initially (and of Mecca after 1882); the Jawah community; the pilgrims, students, teachers, and tariqa shaykhs; and the Islamic community of Singapore. The growing desire to perform the hajj led to economic change through the greater involvement of peasants in the colonial cash economy in order to acquire the ready cash for a journey bound up with prestige and upward social mobility.

By the early decades of the twentieth century, the transformation within the traditional elite from a secular to an increasingly Islamic orientation — which was just beginning in the pre-1910 period — continued to be evident. A certain politicisation of this newly orthopraxic elite emerged as secular power was usurped by the colonial government, and, in this context, the hajj became involved in the growth of Malay nationalism. In economic terms, the hajj was involved in the evolution — just discernible in this period — of both a Malay-Muslim middle class and its intellectual leadership. The former rose from the

ranks of the newly cash-conscious peasantry, and the latter from among the newly educated young members of the traditional upper strata of peasant society.

Between the late 1920s and the Second World War, the hajj was involved with legitimising the traditional elite, creating a new economic middle class from among the peasantry, and legitimising the growing and discontented elite of this emerging Malay-Muslim middle class. The hajj also altered the fabric of Malay society by raising its orthopraxic component as increased proportions of the Muslim population performed it in the Wahhabi and reformist atmosphere of this decade. In this climate, the hajj began to create a more uniform Islamic dimension to Malay identity.

As nationalism matured, roughly in the period between the 1920s and independence in 1957, there appeared to be a strong relationship between time spent at the Muslim centre and social and political discontent upon return. Currently, contact with the centre seems to lead, on return, to dissatisfaction with one’s own personal, interior, spiritual life, but not with the larger social and political world. This may be because the Malaysian government encourages interaction with the centre and is perceived (largely through LUTH) as having concern for the well-being and needs of Muslims. Moreover, because the centre is non-revivalist, the centre and the periphery espouse a similar view of Islam at present. The dakwah revivalist movement is thus not viewed by the average Malay hajji as being representative of the view at the centre and deserving of emulation. The political and social discontent manifested in the dakwah movement clearly does not appear to be related to contact with the Hijaz.

The journey to the centre is creating increasing numbers of orthopraxic individuals who are concerned with being better Muslims within the context of a common interpretation of Islam currently acceptable to the guardians of the centre — i.e. the Saudi royal family — and the federal government of Malaysia. A “more” Muslim society is evolving, a society determined to perceive itself as increasingly Muslim and to behave in what is commonly identified as a “good” Muslim manner. In the process, however, this society has become more susceptible to manipulation and control through a commonly approved Islamic idiom.

[53] This chapter is about patterns. The sources from which the patterns have been deduced vary over the hundred year period covered by the inquiry. Materials were collected and analysed over a three-year period using a variety of methodologies including archival research in London and Kuala Lumpur, in-depth interviews in two carefully chosen villages in the Malaysian states of Kelantan and Selangor and survey research. Written sources included both primary and secondary materials such as British and Malaysian government records and files, published memoirs and texts, and unpublished theses and papers.

For the earliest periods discussed, information about pilgrims and pilgrimage can be found primarily in published memoirs and eyewitness accounts, in the records of the British Foreign and Colonial Offices, especially CO273 (1869–1912), FO685 (1859–1887), FO368 (1909–1918), and in the reports of British Consuls stationed at Jidda.

By the late 1920s, indigenous Malayan sources become richer and much information can be found in the reports of the Malayan Pilgrimage Officer; the annual administrative reports for the Federated and Unfederated Malay States (FMS and UFMS); federal and state establishment lists; the ordinances and legal codes of the straits settlements, the FMS, the UFMS, and the individual Malay States; the federal and state census reports; and the state and district level records of Kelantan and Selangor. FO686 (1917–1925), FO905 (1934–1947), FO371 (1906–1950), and CO727 (1922–1923) remain helpful. Written sources for the past twenty years come mostly from the files and records of the Malaysian pilgrimage regulatory organisation, Lembaga Urusan dan Tabung Haji, from articles in the indigenous press and from the annual reports of officials involved with regulating pilgrimage. Personal interviews (1981–4) and a survey conducted in 1981 (see note 9) account for much of the descriptive material in the most recent period and provide the basis for analysis, particularly concerning questions of pilgrimage composition and of personal and social change.

[54] The term “overseas pilgrims” is commonly used to define pilgrims not from the Islamic “heartlands”. It may sometimes have meant pilgrims arriving at Jidda by sea. The term is used throughout the relevant historical literature. In 1981, the figure for overseas pilgrims was 322,621 according to LUTH statistics.

[55] In the late nineteenth and early twentieth centuries, European interest in the conduct of the hajj centred on health concerns. In the decade between 1910 and 1923, some colonial officials viewed sanitation problems in the Hijaz and on shipboard as the main reason for regulating the Muslim pilgrimage. Others were concerned that anti-colonial, nationalist stirrings in the Middle East would be transmitted to the colonies. This tendency to equate pilgrims with anti-colonial subversion was less strong in Malaya than in Indonesia or India. Nevertheless, the first Malay Pilgrimage Officer, assigned in 1924, was under the direction of the Political Intelligence Bureau of the Criminal Investigation Division of the Police Department of the Federated Malay States. Ten duties were outlined for him — with intelligence gathering while in the Hijaz being far down on the list. His appointment called attention to the relationship between the hajj, Islamic orthodoxy, and political discontent.

[56] The term “traditional elite” refers to those who governed Malay society prior to and (under supervision) during the colonial era. Sometimes, although not necessarily, members of this group were involved in the diverse federal bureaucratic structures. The term is still common today. It includes members of the various royal families, their staffs, and retainers, kathis, penghulus, and magistrates. It also includes individuals who have received various royal titles such as “Dato” and “Tan Sri”.

[57] There is strong evidence that tariqa induction was especially popular for pilgrims from the Malay archipelago. A nineteenth-century observer provides lengthy discussion of this and of the complex interconnections between tariqa shaykhs in Mecca, their representatives in the East Indies, Jawah members of the brotherhoods and pilgrims in both Mecca and after their return home (see Hurgronje 1931: 215–92). The emotional bonds established during the pilgrimage journey fostered a feeling of oneness with Islam and of identification with the greater Muslim world. Tariqa induction and participation upon return home provided a means of continued communion with the Muslim centre. In addition it appealed to Malay Muslims whose personal Islam found roots in a syncretic past. There is also much evidence that tariqas played an important role in the development of the Kaum Muda Islamic reformist movement, which in turn played an important role in the early development of Malay nationalism (Roff 1974: 56–60).

[58] Ketua Kampong (village headman), Hajji Abdul Karim bin Hajj M. Noor of Kampong Jawa, Selangor, performed hajj in 1927 and remained to study. While residing at Kampong Jawa, in the home of one of his daughters, I interviewed Hajji Karim on this topic on numerous occasions between August and December 1981.

[59] Evidence of this is generally anecdotal. It is important to understand that modern, sophisticated, educated Malaysians continue to recognise a variety of spiritual and mystical occurrences. Illustrative examples are common in daily life. As noted in note 5, Islam in Malaysia is tied up with both indigenous and Sufi mysticism, the latter often carried directly from Mecca via the hajj. Despite LUTH efforts to eradicate the practice and to divorce the Malay interpretation of Islam from “pre-Islamic, animist” beliefs, both peasants and university lecturers occasionally consult bomohs before departure on the hajj. Previously, consultation with a bomoh was considered normal and acceptable. It is now officially frowned upon and occurs less frequently. Stories of individuals undergoing mystical transformations which produce tangible economic consequences following the hajj are not uncommon. In addition, there is a strong association between Mecca, the hajj as the reference point for entrance into the world of Mecca, and the importation into Malaysia of toyols, a type of spirit believed to come to Malaysia via the hajj. This spirit is thought to produce economic prosperity for its owner. Belief in this spirit is as strong among educated urban dwellers as among villagers.

[60] By the second decade of the twentieth century, requests to proceed to Mecca, in lieu of serving a jail term, were so numerous that they began to be refused on the grounds that too many criminals were avoiding prison punishment, preferring the journey to Mecca to atone for their social transgressions: K473/14; BAK “M” 64/19. BAK refers to the files of the British Advisor to Kelantan which are available at the Arkib Negara, Kuala Lumpur. There are also numerous examples of this association in current daily life. Political figures released from prison will head for Mecca to become reborn in the eyes of their constituencies. The same is

true of individuals who somehow fall from political grace. Some people may perform hajj or ‘umra following an accident or illness or other misfortune. For example, former Foreign Minister Tan Sri Ghazali Shafie undertook the journey following the January 1982 crash of his private plane in which he was the sole survivor. The crash took place amidst rumours of improper behaviour which threatened to ruin the minister’s political career. Public opinion considered his journey to Mecca as an appropriate element in his political rehabilitation and, despite the controversy surrounding the crash, he was renamed to his cabinet position following the April 1982 elections.

[61] The survey was conducted at the Kelantan and Selangor airports as pilgrims departed for the 1981 hajj. My hope was to obtain information on pilgrims’ socio-economic backgrounds, feelings, expectations, fears and desires with respect to the pilgrimage experience. The information was intended to supplement archival and in-depth interview data. Statistically appropriate quantities were chosen, given the numbers of 1981 pilgrims registered for the hajj from these states. The total sample contained approximately 1,400 pilgrims. Kelantan and Selangor were chosen as opposite ends of the rural-urban scale, and as extreme representations of divergent colonial experiences within British Malaya. In addition, Kelantan has historically sent large numbers of pilgrims and has been the centre of Partai Islam politics in Malaysia and of the dakwah Islamic revival in recent decades.

** Chapter Seven: The hijra from Russia and the Balkans: the process of self-definition in the late Ottoman state

Kemal H. Karpat

*** Introduction

This chapter deals with the identity change among those Muslims living in an area that corresponds more or less to the Ottoman territories in the Balkans, Caucasus, Anatolia,

northern Iraq, and Syria. In these regions, the most significant change in social identity in the last decades of the Ottoman empire was defined by the migration, self-defined as hijra, which originated in European areas of the empire and had as its destination the Ottoman provinces of Asia. This migration may be regarded as a continuous process that extended over a period of roughly sixty-five years from approximately 1850 to 1914. Intensive mass movements of the European Muslim population occurred in the period 1862–5 and again in 1878 in the face of coercive measures by Russia and Bulgaria. Both before and after these periods of mass exodus, smaller groups moved steadily from Slavic lands towards Anatolia.

The “Muslim” identity of these populations consisted outwardly of certain objective symbols and acts such as names and rituals, through which an individual related himself to a group or community that called itself Muslim. The actual active practice of the faith did not appear to be necessary for one to consider himself Muslim, nor was it a precondition for his acceptance by his Muslim group. For the average Muslims in the groups I have studied, the besmele (Arabic, bismallah, ritual invocation of God’s name) and kelime-i shehadet (Arabic, shahada, profession of the faith), if seemingly sincere and expressing serious commitment to the faith, were considered sufficient proof of one’s identity as a Muslim. (Of course, fasting during Ramadan and the observance of other Muslim rites were additional proofs.)

It will be my contention, first, that at the place of origin the migrants tended to identify themselves with Islam in terms of social behaviour and ritual rather than in terms of a political system;

second, that the process of migration transformed this relatively passive communal Muslim identity into a more dynamic political consciousness by enlarging its geographic and ideological scope; and, third, that the process of migration not only changed the original communal Muslim identity of the migrants but also helped to politicise the identity of Muslims in the areas to which they went.

*** The historical migrations: a brief sketch

Migrations into the Ottoman state began at the time of Russia’s annexation of Crimea in 1783. Muslims began to leave their ancestral homes largely because they desired to live under the authority of a Muslim ruler rather than under the Russian Orthodox Czar, but there were compelling economic reasons as well. As the Russian presence in Crimea increased, Muslim peasants became the tenants of new Russian landlords, who tried to maximise their income by bearing hard on the cultivators. The peasants and, eventually, the Muslim aristocrats, who had served in the Czar’s administration until their places were taken by Russians, found salvation in emigration. Emigration intensified after the wars of 1806–12 and

1829, especially after the Crimean war of 1853–6, since the Muslims had supported the Ottoman and allied armies in the hope of regaining their old autonomy and independence. After 1812, the Russian authorities, caught in the political-religious fervour of orthodoxy, increasingly sought to rid themselves of the Muslim population by encouraging or forcing emigration (Karpat 1984–5). The last gasp of this policy came as late as 1944, when the entire Muslim population of Crimea, including Communists and partisans who fought the Germans in 1941–3, were forcibly uprooted and sent to central Asia.

A major wave of emigration from the Caucasus — which reached its peak after 1862 — began after the anti-Russian resistance of the Muridists led by Shaykh Shamil was finally crushed in 1859. This Caucasian migration, which continued well into the twentieth century, is sometimes referred to as the Cherkes, or Circassian, migration, but it actually involved a great variety of groups that were ethnically and linguistically unrelated to each other.

The last large wave of migrants came from the Balkans after the Turco-Russian war of 1877–8 and the Balkan war of 1912–13. The Muslim population of the Balkans, which was a majority in many areas, was parcelled among various new non-Muslim nation-states in the area as these were broken off from the empire, and in each case the Muslims were immediately encouraged or forced to emigrate. Serbia had begun expelling the Muslims after it acquired

a degree of autonomy in 1815; Greece, Bulgaria, and Romania followed in 1878, 1892, and 1913 respectively.

Albania declared its independence in 1912 in order to avoid being incorporated into Serbia, which had already seized most of Macedonia and its huge Muslim population, consisting of Albanians in Kosovo and Turks in Uskup (Skopje).

The total number of people immigrating into the Ottoman Empire between 1860 and 1914 was approximately five to seven million. The Ottoman statistics indicate that the total population of the country rose by about 40 per cent in the period 1860–78 and by about 10 per cent to almost the end of the century. As the Ottoman birth rate during this period was barely 1.2 per cent, the conclusion that the growth of population was due chiefly to immigration is inescapable (Karpat 1985).

Behind these migrations, in addition to the political-historical causes already cited, lay another reason: the practice of hijra itself. As Masud shows in Chapter 2 of this volume, the concept of hijra has exercised a profound influence on Muslim thought and practice over the centuries. It is thus not surprising that it became an intrinsic part of the Ottoman intellectual heritage. But the special position of the Ottoman sultan as the caliph of all the Muslims — the idea of a universal caliphate was politically revived in the

nineteenth century — and the insertion of a clause in various treaties signed with Russia and the Hapsburgs, allowing Muslims in those territories to declare allegiance to the caliph in their Friday prayers, greatly enhanced the position of the Ottoman Empire as a centre and a haven open to all Muslims. This principle was given new meaning in the late 1880s, when the sultan was persuaded to declare the empire open to all Muslims who wanted to migrate and settle there. In sum, the Muslims living on the periphery of the empire, who were faced by threats to their cultural existence and material welfare, sought salvation by moving closer to the centre — whose attraction and importance had risen in proportion to the weakness of the periphery.

It should be noted, however, that more than one centre was envisaged. Although Muslims of Russia and the Balkans preferred Ottoman lands for historical, political, and religious reasons, the empire was not always the final destination for all Muslims. The religious elites — notably from central Asia, Afghanistan, and the Caucasus — brought the hijra to its natural conclusion by migrating to, and settling in, Mecca and Medina where many of their descendants, although “Arabised”, survive as a distinct group today. It is essential to point out, however, that for the Muslims of central Asia the hajj was considered somewhat incomplete without

a stop, sometimes for years, in Istanbul. The multi-sided cultural and political significance of this “second-tier hajj” deserves a full study.

*** The migrants

The migrants were extraordinarily diverse in social, ethno-linguistic, and historical background. The Crimeans spoke their own Turkic (Tatar) dialect, as did two or three of the groups from the Caucasus, and this dialect was divided into several sub-dialects. The Caucasian groups — the Cherkes, Chechen, Abkhazians, and Georgians, among others — who were not racially or linguistically related to Turks, spoke a variety of languages. The bulk of the immigrants from the Balkans were ethnic Turks and spoke the Rumilian dialect, but among the Balkan migrants there were also large groups of Slavic-speaking Bosnians, Herzegovinians, Montenegrins, and Pomaks. Many Cretan Muslims spoke Greek, and the Albanians their own tongue.

Most of them, however, shared two characteristics. The first was a tribal background. In their place of origin the Caucasian migrants had lived under the authority of tribal chiefs and feudal lords. Only in Daghestan had the fundamentalist, egalitarian, anti-Russian movement of Gazi Molla and Shaykh Shamil, known as Muridism, created a degree of unity and a sense of Muslim identity that superseded tribal loyalties and identities. This was possible because of the struggle against the common enemy, the Russians. The same sort of tribal affiliation prevailed also in most of the rural areas of Crimea, although here the Khanate had fostered a degree of political awareness and Islam had been accepted much earlier than in the

Caucasus, so that the various groups felt a high degree of religious and, to a lesser extent, political identification. Moreover, the Crimeans included a highly developed merchant group linked to the old aristocracy and inhabiting the coastal areas; with them tribal affiliations were weak, while among the peasants in the interior, tribal loyalties were strong. The Slavic-speaking Bosnians in the rural areas were under the authority of their own feudal lords, who had bitterly fought the Ottoman centralisation policy in the 1840s in order to preserve their autonomy. Many of these feudal lords had, at the time the province was conquered in 1463, accepted Islam as the new faith; it supposedly was close to their native faith of Bogomilism, a mixture of Christianity, paganism, and Manicheism. In doing so, they hoped to preserve their land holdings and ethnic identity. The Albanians and Montenegrins had preserved their old tribal mores,

although these were considerably weakened over the centuries under the joint impact of Islam and Ottoman political culture.

The groups that had developed a degree of political-ethnic consciousness prior to their conversion to Islam tended to maintain it after conversion. This was notably true in the case of the Muslim Slavs, especially the Bosnians, who had their own kingdom prior to its conquest by Mehmet II in 1463. The Albanians, the oldest people in the region, who had lived under various rulers and feudal lords, also maintained a degree of ethnic consciousness. The sense of ethnic identity of the non-Turkic groups in the Balkans was expressed, prior to migration, in a negative manner: they insisted that they were Muslims but not Osmanlis (Turks), but this sense of separateness appeared not to have had any political significance. It is essential to stress the fact that, except for the Crimeans, none of these groups identified itself with a Muslim political state of its own prior to migration. Among the Crimeans, the memory of independent statehood had become blurred during Ottoman rule, despite the fact that their aristocracy and the ruling dynasty preserved a sense of historical continuity. Thus, it may be stated that before their migration into the heartlands of the Ottoman state, most of these Muslims identified themselves with their tribe and ethnic groups, while Islam provided principally a norm for social behaviour and secondarily an identity source.

The situation in sections of the Caucasus was different, however. There, Islam was the most important source of identity change prior to migration — mainly due to particular socio-economic and political forces at work. Initially, the highly diversified tribal society of the north-east, known as Daghistan desired to preserve its traditional social organisation, which ranged from democratically self-governing communities to feudal lordships and slave trading. Muridism, which started late in the eighteenth century, was initially a conservative resistance force against Russian occupation but soon changed its ideological content. It became a Sunni fundamentalist Islamic movement for social justice that called for the liberation of the peasants from feudal servitude and the elimination of old, barbaric traditions. Transformed rapidly into a populist mass movement, it was joined later by the beys of Circassia and other feudal lords, who decided that the Muridists could better serve their interests than the Russian occupiers. The Muridists were instrumental in converting many animist tribes to Islam and in sharpening the Islamic consciousness of the

adherents to a degree hardly known elsewhere in the Islamic world, notably under the leadership of Shaykh Shamil in the period 1834 to 1859.

In the Caucasus, therefore, Islam became a rallying point for political mobilisation and a militant movement that helped it become rooted as a religion. In this, it was immeasurably aided by the Naqshbandi tarikat (Arabic, tariqa, brotherhood or order), the dominant Sufi order in the Caucasus. Its worldly, politically militant attitude was to a great extent conditioned by the events in the Caucasus, for most of the Muridist leaders, including Shaykh Shamil, were Naqshbandis. Indeed, Caucasian migrants were in good measure responsible for strengthening the Naqshbandi movement in the Ottoman state and in Turkey.

For the overwhelming majority of Muslims in the Balkans, despite the fact that most of them were living on the border of the Islamic world facing a hostile European-Christian world, Islam remained apolitical until they were uprooted. Their passive cultural-religious consciousness was easily converted to a dynamic Muslim identity when the circumstances required; however, in general, until the migration occurred, the Islamic identity of these Muslims was reflected largely in non-political rites and social practices.

The second common characteristic shared by the migrants was the Ottoman political culture.[61] This culture was Islamic in origin, but in practice it aimed at creating a social and political order in accordance with the ethnic and religious realities of the entire population of the realm. It began to evolve as early as the fifteenth century when Sultans Mehmed II (AD 1451–81) and Suleyman the Lawgiver (AD 1520–66) laid the foundation for it through a variety of kanunnames, or edicts issued by the ruler and not forming part of the shari‘a or revealed Islamic law, which in fact made up the Ottoman Constitution. Theoretically, the kanunname was bound to conform to Islam; in practice, deviations necessitated by practical consideration were possible. The §eyhulislam (Arabic, Shaykh al-Islam, paramount religious official at court), who was appointed by the sultan, seldom refrained from issuing a fetva (Arabic fatwa, religious-legal opinion) approving the government’s decisions; thus formal conformity to Islam in tradition was achieved. The Ottoman courts and legal system were both Islamic and “secular” — in the sense that they could adapt themselves to social, economic, and political changes outside the realm of religion but without appearing to do so. The Muslim courts were spread throughout the country and generally enforced the rules of the shari‘a, which together with the kanunnames thus produced a degree of uniformity in family affairs, contracts, and other civic matters. This brought about a collective mode of social behaviour among Ottoman Muslims.

The central administrative system also contributed to the development of the Ottoman political culture, with secular overtones as necessitated by local interests. The sultan’s authority was well represented by the officials appointed by and working at the discretion of

the central government in Istanbul. The field administrators, such as the beylerbeys and sanjak beys, were appointed by the central authority and had at their disposal fairly large contingents of Janissaries, whom they used to maintain the authority and enforce the decisions of the central government. The appointment of natives to various local administrative positions and the granting of a degree of de facto administrative autonomy (as was the case in the Arab provinces) was commonplace. But all of these local appointments were formally sanctioned by the central government, although they were often in reality an expression of local interests and preferences.

Most of the migrants were from regions in which the Ottoman central government had enforced a relatively uniform judicial and administrative system and philosophy of state, society, rights, and obligations.[62] The result was a political culture that was in essence a secular political culture legitimised through Islam, but — for that very reason — capable of adaptation to and evolution into new patterns, including territorial statehood. Muslims — especially in the Balkans, the Crimea, the coastal areas of the western Caucasus, northern Iraq, and Syria — reflected this Ottoman political culture in the similarities of their social behaviour patterns, and in the fact that the elites of the migrant groups were predisposed to accept the decisions of the central authority.

*** Conditions favouring a change of identity

The initial Ottoman policy towards immigation was devoid of ideological significance, as indicated by the statutes of the immigration offices. The early Muslim muhajir (migrant) had been accepted as part of a general sense of Islamic duty, but also because of the traditional Ottoman practice of granting asylum to anyone, Muslim or non-Muslim, requesting it.

By 1880, however, the government’s policy towards immigration had taken a definite ideological bias in favour of Muslims. The old policy was officially changed in 1887 after the office of the §eyhulislam wrote to the incumbent Sultan Abdulhamid II that the lives of Muslims under foreign rule had become intolerable and that every Muslim wishing to live in an Islamic country should be allowed to immigrate. Implicit in this recommendation was the suggestion that the Muslims wishing to enter the Ottoman realm be given priority over non-Muslims (Karpat 1981). It is symbolic that the office charged with overseeing immigration matters was renamed at this date the Muhacirin-i Islamiye Komisyonu Alisi (High Islamic Immigration Commission) and was placed directly under the sultan-caliph. One of the consequences of this change of policy was that by 1901 the mass settlement of non-Muslims in Palestine was prohibited. The Jews, in particular, while allowed to immigrate and settle in Ottoman lands, were expressly prohibited from settling en masse in Palestine as they wished to do.[63]

The reforms began chiefly with Sultan Mahmud II (1808–39), entered a new phase in the Tanzimat era (1839–76), and, finally, took an entirely different course after 1876 under Abdulhamid II.[64] Under Abdulhamid II (1876–1909), the reforms became self-consciously Islamic in character, due in good measure to the changes brought about by the migrations. Indeed, it was the migration of the Muslims from the periphery of the Muslim world that forced him to adopt his so-called “Islamic” policy, and to follow a political course different from that of his predecessors. This policy, promoted often as Ottomanism, actually represented a new concept of state, nationhood, territory, and Islamic identity, and had little in common with the classical Islamic ideas of state, government, and territory.[65] That Abdulhamid’s policy of building a unitary Islamic national territorial state was backed by a large part of the ‘ulama’ shows that even the most orthodox Muslim scholars would accept a change of political identity as long as it was carried out within the cultural perimeters of Islam and was enforced in accordance with its methods, especially when the survival of the Muslim society as an independent entity was at stake.

*** The migration process as a catalyst for identity change

The causes that triggered the migration were instrumental in preparing the migrants for a change of identity. Basically, all of the emigres acted because of threats, implied or overt, to their lives and property.

The ill-armed Caucasian rebels resisting the Russian army were mercilessly massacred or uprooted. British consular statistics place the number of Caucasian deaths — many from starvation and disease — at over half a million (Pinson 1972: 71–85; Voennyj Sbornik 1884: 158–96).[66] The Caucasians remaining in their ancestral homes were given the opportunity to convert to Christianity and settle in the easily controllable plains of Kuban; later they were asked to serve in the Czarist army, raising the possibility that they might be forced to fight other Muslims. Many, as a consequence, migrated to Ottoman lands in the period 1862–5.

In 1878, about a million Muslims were forced out of the area which is now known as Bulgaria and Romania, by the Russian army and Bulgarian armed bands, which, according to British embassy reports, also killed some 300,000 Muslims. Russia wanted to establish a national Bulgarian client-state and sought by brutal force to turn the Orthodox Christians into a dominant majority. These migrants lost all their land, houses, and even personal belongings. Very few received any indemnity for these losses, although, in the case of the refugees from Bulgaria, some were allowed to go back and sell part of their property at derisory prices. Thus, the migrants who belonged to the upper classes found themselves as poor and destitute as the humblest citizen of the community.

This forceful action was given wide coverage throughout the Ottoman state by the newly emerging press. The reports in hand indicate that one of the most widely discussed topics

among the pilgrims at Mecca after the 1860s was the fate of Muslims in the European Christian lands. Thus, the citizens in the heartland also were made increasingly aware of their own Muslim identity, and this in turn had an effect on the way they received the immigrants. Following the well-established Qur'anic obligation to provide shelter and help to the muhajirs (see Masud, Chapter 2 of this volume), the migrants were sheltered and fed for months, and even years, in private homes. In many areas the local Muslims helped build homes for the newcomers. Although there were unpleasant clashes, caused by the warlike attitude of the Cherkes tribes as much as by negative reaction towards the migrants, these were the exception. The manner in which they were welcomed by the Muslim population of their new home further solidified the migrants' Muslim consciousness and eventually facilitated their integration into the society.

In itself, the act of mass migration, which was experienced in common by both the lowest- and the highest-ranking Muslims of the communities, helped to increase the sense of Muslim communal solidarity and to bring down those social barriers that had separated the migrants in their original homes. Not only did attitudes of mind undergo transformation; concrete changes in their economic and social conditions resulted in greater equality as well. The leadership position of the traditional chiefs was eroded when migration deprived them of the economic and political power that had bolstered alignments in the old hierarchies. Occasionally, the attempt was made to re-establish the traditional social system in the new home, but, as will be explained later, the settlement policies of the Ottoman government made the re-establishment of the migrants' traditional power structure difficult, if not impossible. For individuals with latent leadership ability, the migration was to some extent a liberation from the constraints of the social and cultural mores and from the hierarchy of authority prevailing at the place of origin. For individuals with personality characteristics conducive to innovation and the easy acceptance of socio-political change, the migration provided an opportunity for self-affirmation. The overwhelming need to survive and adapt to new places and conditions of settlement called for vision and initiative, and the individuals with those personality characteristics rose to positions of leadership.

This argument is supported by data showing changes in social structure and leadership cadres among the Crimean migrants established in Dobruca following the Crimean war of 1853–6. At the bottom of the social scale among these Crimeans were the Nogay, who had maintained a tribal form of organisation and leadership and were involved in agriculture on the Crimean plateau. The upper class, which had lived in the cities along the Crimean coast and were better educated, continued after migration to regard the Nogay as inferior and attempted to monopolise the positions of power in Dobruca. However, the Nogay, who were no longer willing to remain a permanent under-class, protested vehemently (in protest a group of them even returned to Russia), forcing the Ottoman government to accord at least symbolic recognition of their equality by giving them medals and salaries as it did to other Crimean leaders (Karpat 1984–5). After Dobruca was ceded to Romania in 1878, the social differences among the Nogay, Yaliboy, Kerish, and other Crimean groups vanished as they all amalgamated into one single Muslim-Tartar group in an effort to preserve their Muslim identity. To this day Romania classifies its 60,000 Muslims as Turks and Tartars.

Ifa tribe or village emigrated en masse and then was resettled as such in a geographical, cultural, economic, and political environment very similar to the place of origin, it was possible that the old social structure, including the leadership, might survive to hinder identity change. However, the Ottoman government took steps to prevent this. It already had long experience with the settlement of tribes in the fifteenth through the eighteenth centuries, and had established a pattern designed to facilitate integration. The tribal confederations, notably the Caucasians, were divided into several groups and settled in different places. Many tribal and communal chiefs were given special incentives to encourage them not to continue to assert their leadership: some were enrolled in the army with officer ranking, while others, along with the religious heads, were encouraged to settle in cities. The leaders of the settled and well-established communities from the Caucasus and the Balkans preferred, in any case, to settle in the cities.

The effect of this policy was that the immigrant elites were rapidly incorporated into the body of the Ottoman elites and thus became part of the establishment, while their former constituents, free of the burden of loyalty and obedience to the old leaders, could adapt themselves to their new environments as they saw fit. The immigrant elites and their offspring played a major role not only in helping to define and shape the emerging Muslim-Ottoman identity but also in promoting successfully the acceptance of this new identity among those they formerly led. Furthermore, the new leadership cadres that arose in the settled communities also came to play a major part in this transformation, as they sought in a conscious fashion to identify themselves and their communities with the values and the political goals and aspirations of their new motherland.

Those of the old leadership who did not settle so easily into new roles as integrated members of the Ottoman establishment found that despite their best efforts they were, in the new conditions, unable to maintain themselves in their traditional positions of power vis-a-vis their fellow migrants. Many of those who, in former times, would have placed the interests of themselves and their own social group above those of the community as a whole, now became the advocates for the entire community. They hoped by identifying themselves more intimately with the larger group to maintain their leadership positions, and to gain influence in government circles by virtue of their position. However, as it seemed obvious that these former chiefs, now far away in the urban areas, were bent mainly on perpetuating the old order and their own ascriptive privileges, they were soon replaced by new leaders who were better able to articulate the needs and aspirations of a people seeking to cope with a changed geographic and social environment. The first generation of these new communal leaders maintained contact with the old chiefs, but the second and succeeding generations defined their position and role in accordance with the conditions prevailing in the community rather than in accordance with the advice of the elders. They soon began to define their identity in terms of the new Ottoman-Muslim constituency promoted by the sultan-caliph.

*** Pan-Islamism and identity change

Pan-Islamism, actually Islamism (islamcilik) in the Ottoman state can be considered as a grass-roots fundamentalist movement seeking socio-political accommodation in Islamic terms.[67] It was, to a rather large extent, a by-product of the mass nineteenth-century immigration, which brought with it into the Ottoman realm many of the different religious ideologies of Muslims on the fringes of the disintegrating empire. The movement played a vital role in the change of identity of both newcomers and old residents of the Asian provinces of the Ottoman state.

The press of the 1860s and, especially, of the 1870s expressed a deep dissatisfaction with the condition of economic and political affairs in the Ottoman state. Thousands of workers in the traditional textile industry had been left unemployed when cheap cloth from England and France flooded Ottoman markets after 1840: unemployment among craftsmen rose to approximately 70 per cent. Muslim merchants and small landowners in the countryside, dominated and exploited by the European economic interests via the local Christian commercial intermediaries, shared the discontent of the peasants and workers (Issawi 1966; Pamuk 1987). The government was accused of being unable to stop the country’s territorial disintegration or uphold Muslim rights. These accusations became far more widespread and vehement — encompassing now the discontent of the upper classes and religious establishment — after the debacle of the 1877–8 war with Russia. The millions of destitute Muslim immigrants pouring in from the Balkans and the Caucasus (Istanbul alone received about 200,000 refugees in 1878) further increased the general apprehension. It was about this time, moreover, that various obscure princes and sultans from Asia and Africa, threatened with occupation by the European powers, wrote to Sultans Abdulaziz (AD 1861–76) and Abdulhamid II asking for protection and offering allegiance in exchange. These factors appeared to foreshadow the development of pan-Islamism as an international movement, but despite European fears, this kind of movement failed to materialise.

The Islamic current that did emerge manifested itself in the form of grassroots demands — from both low-level religious leaders and laymen — for Islamic unity and action to assure the survival of the state as a Muslim entity and to better the lives of the faithful. The existing administration was considered to be both incompetent and so corrupted by the European-style reforms of the Tanzimat that it was unwilling to follow a truly Islamic path. The refugees gave their full support to this movement, in the hope that a revitalised Ottoman government would reconquer the European territories and they would be able to return to their homes. This hope was soon dashed, however, as Sultan Abdulhamid refused outright to enter on a policy of reconquest.

The central idea of the Islamic populist-fundamentalist movement was that the Ottoman Muslims were a millet — a nation — deserving ofa land of their own where a Muslim way of life under Muslim rule would prevail (Lewis and Braude 1982). Whereas in the past the term millet was applied only to non-Muslim communities, now even the sultan began to refer to the Muslims as “my nation” (benim milletim). The fundamentalists regarded the remaining Ottoman territory as the land wherein the expectations of this Muslim nation could be fulfilled; territory therefore appeared as an indispensable condition for Muslim survival. The literati of the movement

attempted to prove that Anatolia was the predestined homeland of the Muslim Turks by associating it with such mythical heroes as Ayub al-Ansari (who died at the Arab siege of Constantinople), Mehmet II (the conqueror of Istanbul), and the present sultan himself. Thus the idea of a multi-religious, multiethnic nation unified under the doctrine of “Ottomanism” (as enunciated by the Tanzimat reformers), was turned back on itself by the fundamentalists and became a concept of a homogeneous Muslim nation occupying its own territory — i.e. the “motherland”. Although the Islamists, principally the high ‘ulama’, theoretically rejected this concept as undermining the unity of, and allegiance to, the umma, it was adopted as basic to the preservation of their Muslim culture and religion.

The fundamentalist movement included a large number of immigrants, among whom were the leaders and members of both Sunni and non-Sunni tarikats. These tarikats had strong popular bases, and many were instrumental in the perpetuation of egalitarian populist ideas: e.g. the Bedreddinis of Serres; the Qizilbash of Deliorman and Dobruca; and the Naqshbandis and Muridists of the north Caucasus. Traumatised by their experiences as refugees, they were anxious to know how such a fate could befall them, and they found the answer in the incompetence of their top leaders. What was needed was an uncorrupted, authentic Muslim leader who would dedicate himself to the fulfilment of Islamic ideals.

Some appear to have been willing to take violent action against the government. In 1878, for example, Ali Suavi, the publisher of the journal, Ulum (Sciences), together with about a hundred followers — mostly refugees from the Balkans — landed on the pier of the palace of Sultan Murat V at Ciragan with the intention of bringing him back to the throne, then occupied by Abdulhamid II.

Suavi was associated with many dervishes, or popular preachers. He had studied in Europe, was married to an Englishwoman, and, for a period, was the head of the Galatasray, the French school established in Istanbul in 1868. But he was also known to preach in the mosques against European imperialism and the deterioration of the Islamic way of life, and was thus an outstanding forerunner of contemporary Muslim fundamentalism. He apparently wanted to replace Abdulhamid because of his authoritarian policies, his failure to back the Muslim guerrillas fighting the Russians and Bulgarians in the Rodoppe mountains, and his readiness to cede Muslim lands to the infidel. Although Suavi was killed in the action, his followers arrested, and 178,000 refugees living in Istanbul exiled to Anatolia ostensibly to preclude further trouble, the event was extraordinary in that it marked the first time that a group of civilians, rather than a military cabal, had attempted to overthrow a ruling sultan.

The migrants generally accelerated social differentiation in the fundamentalist movement and gave it a class dimension. After the forced mass emigrations from the Caucasus and the Balkans, during which both rich and poor were uprooted from their homes, there still remained large Muslim groups: in the north-eastern section of what is now Bulgaria; in

Dobruca; in Bosnia; in parts of the Caucasus; and in Crimea. After the Balkan war of 1912–13, these Muslims also began gradually to migrate in order to avoid the fate of their co-religionists, and were encouraged to do so by the national states of Bulgaria and Romania, which allowed them to sell their properties and carry part of the proceeds with them to Turkey. Consequently, a large number of beys and other notables, many of whom had owned large tracts of land, carried considerable capital with them to Istanbul. These relatively well-to-do immigrants bought properties, mostly in cities, and became part of the Ottoman urban elite. Many of them invested their capital in commercial and small industrial enterprises, and thus enlarged the emerging urban entrepreneurial class by adding to it a Muslim dimension.

Included among the new Muslim commercial class were aristocratic families and learned ‘ulama’ — from the Balkans, the Caucasus, and Crimea — as well as military officers, some of whom had served in the Czarist armies. Some of these had received a European type of education in their original homes or had studied in European universities, but also joined the Islamist movement. Islam had become, in fact, the chief identity symbol and focus of political allegiance. Two examples illustrate this point. A Muslim member of the ruling dynasty of Montenegro, who enjoyed great popularity at the royal court and owned extensive tracts of land, abandoned all of these and came to live in Istanbul on a small pension provided by the government. The English consul, who reported the incident in great detail, but who of course must not be regarded as an unimpeachable source, observed that, to this Slav aristocrat, the upholding of his faith was dearer than all his riches and titles.[68] The second example is that of General Musa (Kondukov), a Chechen who had reached a very high position in the Czarist army. Eventually, under the pretext of joining a survey commission, he came into the Ottoman state, where he stayed and assumed the command of an army corps. He then fought the Russians in the Caucasus. There are hundreds of similar examples of Muslims from Russia and the Balkans who preferred, even at the cost of privilege and rank, to live as citizens of a Muslim state.

*** Abdulhamid’s synthesis: the change of identity

Sultan Abdulhamid’s first priority, when he came to the throne in 1876, was the maintenance of the six-centuries-old dynasty, and his second was the maintenance of the Ottoman state and territory. His third priority was to strengthen the Islamic creed in whatever way was necessary to assure the mutual survival of dynasty, state, and faith.[69] Through trial and error, an “Islamic policy” gradually emerged.

Proroguing the Parliament and the Constitution in 1878, he sought to silence opposition to the administration at a time when popular dissatisfaction with the government and support for the populist-fundamentalist movement were growing. The populist-fundamentalists did not in fact pose a direct challenge to the throne because they were too heterogeneous and lacked a well-articulated ideology and strong leadership. But Ottoman sultans had always harboured fears of the popular tarikats, and tried to neutralise them by bribes

or even imprisonment. Abdulhamid rather hoped to win the support of the Muslim masses by co-opting leaders of the Sunni orthodox fraternities, or tarikats, of Syria and Iraq — such as the Qadiri and Rafai, which had a mass following.

Although Abdulhamid espoused the Islamist views prevailing initially among the upper classes — which placed emphasis on orthodox Islam and established institutions such as the caliphate, and which were at variance with the views of the populist-fundamentalists — the French occupation of Tunisia (1881) and the British seizure of Egypt (1882) inspired a general change of opinion. Now, after 1882, the leaders of orthodox Islam came closer to adopting the militant, radical anti-European spirit

prevailing among the fundamentalists, and the ideological differences between grassroots Islamic fundamentalism and the state-supported Islamic orthodoxy of the upper-class groups seems to have declined. The two streams converged, in fact, into a distinct consciousness that both sides were part of a single Muslim nation. The sultan, becoming the active champion of this consolidated Islamic nationality, eventually emphasised his role as caliph, although not before the issue had been extensively debated in the press and several religious leaders had urged him to do so for the sake of Muslim unity and survival.

A perfunctory look at the textbooks used in Ottoman primary schools after 1880 shows that these were written primarily to foster a sense of Ottoman-Muslim identity in the pupils. It is not surprising that the Greek Orthodox and Armenian patriarchs in 1897 protested against the obligatory use of these textbooks, which extolled the virtues of Ottoman history and glorified its achievements. The two Christian prelates wished to teach only the history of their own ethnic groups, but their protest went unheeded. In order to develop the concept of the Ottoman-Muslim nation, the government was willing to use all the devices at its disposal — many borrowed from Europe. The elementary schools, which expanded rapidly though not extensively into the countryside during the reign of Abdulhamid, assiduously cultivated the idea of a Muslim-Ottoman citizen. That this was bound to develop in these pupils a political identity different from that of their predecessors was evident.

Abdulhamid was soon to incur the opposition of westernised intellectuals, and even some religious officials, for his timid foreign policy and autocratic manner of governing, and was eventually overthrown in 1908–9. But his Islamic policy produced lasting results. Indeed, it is symbolic that many of the founders of the secret association that came to be known as the “Young Turks” and that produced the revolution of 1908 were medical students who were ethnically non-Turks from the peripheral regions of the state. The founder of modern Turkey, Ataturk himself, who was instrumental in the abolition of the sultanate and the caliphate, was an immigrant from Salonica, as were some of the parents of his two successors as president. Moreover, in the rise of Turkish nationalism, Yusuf Akcura and Huseyinzade Ali (from Kazan and Azerbaijan in Russia respectively) and other immigrants, played key roles. Because Abdulhamid managed for most of his reign not to become embroiled in international wars (except for the short but victorious war of 1897 against Greece), he was

able to devote himself to the promotion of this Islamic policy and to amalgamate the various elements of the population into a synthesis that was the new Ottoman-Muslim nation, existing on its own territory and demanding impersonal bonds of loyalty.

*** Conclusion

The migrations and the circumstances that produced them have been shown to be the catalyst for the transformation of the religious and cultural identity of the immigrants into a dynamic new political identity linked to the new concept of a Muslim territorial state. The migrations also triggered changes in the social and occupational structure, demography, settlement patterns, and land tenure system of the Ottoman state. The migrants were well integrated throughout Muslim-Ottoman society — from the lower classes to the elite classes — and were active participants in its affairs at a time when constitutional changes were being made and a European-type market economy adopted.

In order to achieve internal cohesion, Sultan Abdulhamid II used his position as caliph to contain and control populist fundamentalism, and to integrate it with the more orthodox Islamist ideology of the elites. Eventually, this policy also achieved the ideological and cultural amalgamation of the migrants and large segments of the Muslim middle and upper classes — including the Arabs of the urban areas of Syria and northern Iraq — into a relatively cohesive political and social unit that was the new Ottoman Muslim nation.

The individual Muslim citizens gradually came to identify themselves with the new entity, formed of different tribes and ethnic groups but having Islam as its binding ideology and Turkish as its language of administration and communication. This was the territorial state, the motherland, the vatan, to which, ideally, all Muslims would pledge allegiance and loyalty. The survival and welfare of the motherland took precedence over those of the sultan. Moreover, the idea that certain conditions within the motherland could be improved so as to strengthen the nation and make life better for the Muslims gained acceptance. Thus, the Muslims now looked upon the vatan not only as an arena in which to cultivate virtue and prepare himself for the next world, but also as a place in which to fulfil worldly aspirations. The idea of active participation in political and social affairs espoused by the Naqshbandis was, in fact, an outgrowth of this new worldly outlook. This acceptance of change and material improvement in one’s existence — or “modernisation”, as it was often called — was implicit in Abdulhamid’s Islamic policy.

This new Ottoman-Muslim nation, the results of a dialectical process to which the various elements of the society contributed, had an inner strength that vigorously resisted the forces which, after 1908, pulled it apart: new ethnic nationalisms; the anti-imperial nationalism promoted by the Young Turks; and the threatening military might of the west. Modern Turkey inherited the vital core of this state, and its transformation from a monarchical regime to a

republic was but the logical and ultimate result of the interplay of the forces that had earlier transformed the traditional Ottoman state itself.

*** A personal postscript

Many of the themes that have emerged in this discussion are reflected in my own personal experience of a later period. I was born in Dobruca — a province located between the lower Danube and the Black Sea — in a Muslim-Turkish community that had been part of the Ottoman state from the fourteenth century until 1878, when it was incorporated into Romania. The community, adapting well to the non-Muslim regime, maintained its Islamic communal socio-cultural identity. Although the community consisted of Turks, Tartars, Lazzes, and Kurds, among others, the ethnic differences among the members of these groups were generally superseded by their overall consciousness of themselves as Muslims. Yet there was a striking lack of political consciousness within the Muslim community, which appeared interested mainly in maintaining its cultural, religious, and social customs and mores rather than in securing a distinct legal-political or constitutional recognition of its religious status.

The notables and the religious leaders — the efendis, qadis, and muftis — were even more lacking in Muslim political consciousness than the ordinary members of the community. Most of these rose to prominence during Romanian rule after 1878 as the representatives of the community. They clung tenaciously to their Muslim denomination (which had secured them their position) while also serving the Romanian administration (whose policies often worked to the detriment of the basic principles of their faith). Individuals in the community — usually younger people with some education, the very poor (who felt stifled as a minority with low class status), or the old ‘ulama’ (who did not want to compromise their faith) — looked upon emigration as the only logical way out of their predicament. Those with education had limited opportunity for career advancement, while the poor felt that they were discriminated against and exploited economically by the Romanian officials and the elites of their own community.

Turkey was regarded by both groups as the only country in the world with which they had a cultural affiliation and historical ties, and which offered them hope for social advancement and material betterment. The stories of the secularism and anti-Islamic policies of Ataturk were dismissed by Muslims of all ranks because of the expectation that the basic Islamic identity of the country could not be abandoned, and that the material progress and increased well-being attributed partly to his reforms would compensate for the loss of religious zeal. This was the situation that prevailed in the 1930s, the days of my childhood in Dobruca.

I grew up as a Turkish-speaking Muslim in a community consisting of Muslims of various ethnic origins, and non-Muslim Romanians and Bulgarians. I spoke perfect Romanian and many assumed it likely that I would be assimilated sooner or later into the culture of the dominant Romanian majority. However, I found that my early Islamic education within the family had instilled values that distinguished me from both the Romanians and the subservient Muslim communal leaders: my sense of loyalty to family and friends set me apart from the former and my sense of equality from the latter. It was in these circumstances that my Turkish identity acquired a new meaning, since it provided me with a solution to my personal problems, which had been created by the encounter of different cultures and political systems. The Turkey of Ataturk, cleansed of religious bigotry, appeared as a haven where my aspirations to attend a university (the graduates ofmy school in Romania were deprived of this right) could be fulfilled and my identity would no longer excite the derision of my compatriots. From then onwards, even as my interest in Romanian literature and social life remained alive, I began to feel a keenness in being Turkish in addition to being a Muslim, and began to defend and identify myself with everything I considered Turkish. I finally came to the conclusion that it is not possible to live in two worlds with two cultures and decided, on my own, at the age of 18, to emigrate to my “real” country — only to discover that my Turkish identity was different from that of the natives.

I went to Turkey in the 1940s, and, from the very beginning, I was struck by unsuspected differences of identity, that separated both my Muslim community in Dobruca from that in Turkey, and from me as an individual (coming from a different Turkish-Muslim environment) from the natives. I did not feel these differences in the observance of Islamic rites or in any lack of Islamic self-consciousness (which, despite secularism, paradoxically enough was far more intense in Turkey than in Dobruca). Only years later did I realise that what had struck me as being different was the predominance among the Turks of Turkey ofa special type of political-national consciousness that stemmed basically from Islam — different opinions notwithstanding — while the consciousness of the Muslims of Dobruca was communal and apolitical, or passive. Living in a state of their own that was Muslim in character but also national, the Turks of Turkey had a political consciousness that derived its strength from the fact that they identified themselves with a national territory. In my community in Dobruca, by way of contrast, the territorial identification was conspicuously absent from the Muslim identity. The community had only limited historical memory, possessed no consciousness of its territorial dimensions, and had no political aspirations as Muslims.

Almost all of the Dobrucan immigrants living in Turkey, while fondly remembering their birthplace and often expressing a profound nostalgia for it, became politically identified with Turkey and what it stood for. To the best of my knowledge, out of the 45,000 to 50,000 Dobrucans who went to Turkey in the period 1934–8, only two or three families returned to Romania. In Ottoman times, peregrination between Anatolia, Thrace, and Dobruca was common, and amounted to a mere change of place rather than of identity. But the migrants of the 1930s remained in Turkey because it gave them a political future and because the Kemalist regime began an intensive programme of Turkification. The overwhelming majority of destitute immigrants also knew that they would not be welcome if they returned to their old country. But, above all, the immigrants felt that their traditional cultural and religious identity was no longer in danger, even though some were aware that the government’s view

of Islam in the 1930s was substantially different from that of the populace. Perhaps unsurprisingly, it was only when I migrated for the second time — from Turkey to America — that I was able to put my experiences in Dobruca and in Turkey into perspective.

[62] The term “Ottoman” as it appears in the western and Turkish literature originated in the nineteenth century despite the state’s official title — Devlet-i Ali-i Osmani, “the exalted state of Osman”. For five centuries this title was patrimonial, whereas the term in the nineteenth century came to mean a territorial state and body of citizens inhabiting the Ottoman homeland.

[63] A great variety of books was issued by Ottoman statesmen and thinkers from the fifteenth century onwards on the subjects of the social order, authority, and the duties of subjects. One can cite among them, for instance, Tursun Bey and Kinalizade Ala’i (AD 1510–72). None of their works is translated into English. Kinalizade’s work, Ahlak-i Ala’i was translated into modern Turkish in the Tercuman collection, Istanbul c. 1970-. Kogibey’s famous risale of the seventeenth century also belongs to this category of books.

[64] See the proceedings of a conference on the “Jews in the Ottoman Empire”, to be published by Brandeis University. See also Karpat 1985.

[65] Migration matters were placed initially under the General Commission for Migration Administration (Idare-i Umumiye-i Muhacirun Komisyonu) established in 1860. Later in the 1880s, as mentioned, the new enlarged commission was headed by the sultan.

[66] Although the only land border recognised by medieval jurisprudence was between dar al-Islam and dar al-harb, as early as the fifteenth century the Ottoman thinker Kinalizade Ala’i pointed out in his Ahlak-i Ala’i that the “order of the world” (nizam-i alem) was an arena surrounded by the “walls of state” as part of the cycle necessary for the existence of justice — the key ingredient in the “order of the world”. The area between the “walls of state” would be considered the territory of the state.

[67] These reports are scattered in various collections found in the Public Record Office, London. The FO 78 and 424 collections, covering the period from 1860 and 1880, are particularly relevant. The British government also published several reports on the

Circassians. See, for instance, the report presented to the House of Commons, Accounts and Papers (1864), vol. 63. See also Karpat 1985.

[68] This section draws on my paper presented to the biennial conference on Ottoman and pre-Ottoman Studies, Cuenca, Spain, July 1981, and material obtained from various archival sources which is being amalgamated into a monograph.

[69] On Montenegrins and Bosnians, see FO 424, vol. 72, no. 333 and vol. 89, no. 52; see also dispatches in the Archives of the Turkish Foreign Ministry, Idare, vol. 269.

[70] There is a rich literature in Turkish and European languages on Abdulhamid II, much of which is subjective. The best insight into his thinking is offered by his memoirs published in French and Turkish. The first memoirs, found initially by Ibnulemin Mahmut Kemal in the sultan's private collection in the Ildiz Palace, consist of brief notes related to various issues which came up during his reign. These were published along with new found notes as Abdulhamit'in Hatira Defteri [Abdulhamid's Notebook of Memoirs]. The second series of memoirs was written after Abdulhamid was ousted in 1909 and, though defensive in tone, appears to represent a reasonable general view of his opinion on a number of key issues, including Islamism: Siyasi Hatiratim [My Political Memoirs]. The 5th edition (1987) comprises new additions which do not significantly alter the content of previous editions. The memoirs were also published in French.

** Chapter Eight: Shifting centres and emergent identities: Turkey and Germany in the lives of Turkish Gastarbeiter

Ruth Mandel

<quote>

“For the expatriot, reality is always someplace else”

(Ariel Dorfman, Chilean writer and sometime expatriot)

</quote>

*** Introduction

This chapter addresses the cultural expressions of movement in the migration of Turkish workers to West Germany. It suggests that physical movement entails a variety of types of exchange, which in turn contribute to the dynamics of social mobility. Making these relationships explicit sheds light on the dynamics informing social and cultural transformations.[70]

The particular transformations dealt with here bear on the formation and reformulation of migrant identity in the light of concepts and orientations towards centres and peripheries. The centre dealt with in this chapter in some ways follows the notion of centre discussed by Edward Shils. Shils's centre is ideological in nature, and can be understood as representing the institutions of a dominant order. The centre that I am concerned with is geographically located, but also finds salience in the realm of individual perception. This centredness is articulated in terms of a geographic core which becomes, in effect, a metaphor for an ideological core around which one's identity revolves. Eickelman and Piscatori (see Chapter 1 of this volume) discuss the notion of centres in relation to the complexity of Islamic symbols and affiliations. They make the important observation that the notion of centre must be understood in the plural, in order fully to grasp the complexity of a hierarchy of centres. Furthermore, alternate hierarchies not only exist simultaneously, but, as with all social and ideological structures, remain subject to historical change. The introductory chapter of this volume also calls into question "the straightforward distinction between centre and periphery". The material presented here echoes these concerns by illustrating how the relevant centre

and periphery of the migrants undergo fundamental transformations in relation to each other.

The past quarter-century has witnessed a migratory movement unprecedented in Turkish history and irreversible in its consequences. Close to two million Turks currently reside in the Federal Republic of Germany and West Berlin, with significant numbers scattered throughout the rest of western Europe. West Germany, commonly joked about as Turkey's sixty-eighth province — Turkey has sixty-seven administrative provinces — has entered into the consciousness even of non-migrant Turks in Turkey. An awareness of the Turkish experience in Germany has penetrated the modern-day folklore, popular songs, literature, television, film, popular newspapers, and the daily and annual life-cycles of many Turks. In some respects, the diaspora has ironically assumed the authority of a legitimate and even desirable "centre" in contrast to an increasingly "peripheral" Turkey. This chapter proposes, first, to explore how the central point of reference is shifting by examining the types of

personal encounters between Turkish migrants and Turks who stayed at home; and second, to understand how the relations between the past and present identities of the migrants are shaping a new, emergent identity — one no longer oriented towards a concrete centre, but increasingly towards a necessarily elusive “other place”.

To understand the historical, political, and emotional resonance of this migration, we must first analyse such categories as gurbet and gurbetqi. The gurbetqi — one who lives in exile, diaspora, or away from the homeland — lives in a state of gurbet. It is a relative term, one that might describe the state of those living in Frankfurt, as well as Turks living in Istanbul, who feel that their primary identification is with their natal village rather than the city. The emergent literature and musical genres produced by Turkish artists in western Europe, although addressing this relatively recent phenomenon, actually draw upon a long tradition of exile and gurbet experiences. Throughout history, Turks have known many types of exile and migration. Thus, there is an established paradigm for the cultural structuring of contemporary labour migration. Under current conditions, however, the concentric circles marking distance or proximity from the original centre have expanded, encompassing a new dimension: Alamanya, or Germany.

Despite the Turks’ familiarity with migration and life in gurbet in the past, the German episode marks both a greater distance from the original centre and a transformation of the relationship to the centre itself. Moreover, West Germany, as a “centre” for Turks, threatens to break away from earlier Turkish centres and to establish itself

as a rival, alternative one. This seems to be particularly true for Turks of the so-called “second generation” in West Germany.

The changing relations between core and periphery are highlighted in several contexts. One context is the annual summer izin, the holiday in Turkey undertaken by the gurbetci. Another context is the experience of the “second generation” (German: die zweite Generation; Turkish: ikinci kugik), which can be seen as the repository, or even the creator, of the inherent contradiction between centre and periphery. This generation, often described in melodramatic terms as “caught between two cultures but part of neither”, constructs its identity in a social field where the “myth of the final return” serves as a guiding orientation, to be negotiated amidst a host of contradictions.

A third and final consideration is the effect which migration to Germany has had upon explicitly religious beliefs and practices, both for the dominant Sunni majority and the Alevi minority — which in Turkey comprise perhaps 20 per cent of the total population. In particular, the Alevis have significantly changed their modes of self-expression. I look at how Alevi identity and community is differentially constructed in the West German “diaspora”

and in Turkey; and how, as a by-product of this particular migration and specific social context, Alevi identity has come to be redefined in relation to the dominant Sunni majority.

*** Izin and izinli (taking leave)

Turkey looms large in the social life of Turks who work in West Germany. For example, Turkish politics not only are discussed, but are often engaged in more actively than in Turkey. At home, Turks prefer to watch Turkish video films on their VCRs rather than the German television programmes which they must struggle to understand because of language barriers.[71] Most socialising is carried out with other Turks[72] in private homes, mosques, public restaurants, and coffee houses (the exclusive domain of men), and on structured occasions such as the large parties frequently held in rented halls to celebrate engagements, weddings, and circumcisions. In nice weather, picnics in several parks in particular are so popular that Germans have nicknamed a couple of parks “Turkish meadow”. At many of these gatherings the theme of travel to Turkey dominates the conversation. Both the kesin donu§ (permanent return, repatriation) and the izin (return, the summer vacation) provide grist for endless discussion. Past trips are compared and future trips are the subject of speculation. The discussions focus on both the actual trip itself and on the state of things in Turkey. The

topics discussed include the following: whose car did not make the trip; who was turned back at the Turkish border for what infraction; which side roads are best for avoiding the worst traffic; which alternate frontier crossings have the shortest lines or the most easily bribed customs agents; the European goods most desired by relatives back in Turkey, and how unschooled these relatives are in the real costs of such items; and which travel agents can be trusted to arrange legitimate charter flights. Conversations also include: horror stories of departures from obscure airports, train stations, and bus depots; experiences of those who have recently returned as well as whose investment went bankrupt; who took back his German wife to the village; possible real estate investments; how Turkish compatriots back home try to cheat vacationing migrants; how to smuggle valuable contraband; the devaluation of the Turkish lira; and comparative stories about the relative strengths of different sorts of patronage invoked to weed through the endless, Kafkaesque Turkish bureaucracy.

A great deal of thought, planning, shopping, and arrangements go into the extensive preparations for the trips to Turkey. Much of the preparation is grounded in past experience — what was and was not efficacious on the last trip. Yet the impending journey is also idealised: fantasies are spun, elaborately weaving the texture of the summer to come. Migrants discuss what they will do, eat, see, to whom they will give gifts, which seaside resort they will visit, at what local shrine they will sacrifice a lamb, how they envisage the parties where they will sing, dance, and drink, and how they will add to their new house. Clearly, the ideas of past and future trips to Turkey motivate the physical and psychological energies of migrants while they are gurbetgi in Germany. This focus upon trips

to Turkey should not be surprising, since the sorrow, isolation, and difficulties associated with the state of gurbet cry out to be assuaged. Although the migrants live and work in Europe for eleven months of the year, they do so in order to be able to “really live” during the twelfth month. This attitude is a critical aspect of the Turkish guestworkers’ identity as migrants rather than immigrants: they believe that they are temporary residents and not permanent immigrants, even when appearances seem to indicate the contrary.

The status of Gastarbeiter in Germany contrasts with that of foreign workers in other European countries. In Sweden, foreign workers are called “immigrants” and are granted many more rights of political participation; for example, they are allowed to vote in local elections. Moreover, the processes and criteria for naturalisation differ from country to country.

This migrant identity is highlighted in both subjective and objective definitions. The vast majority of Turks in Europe see themselves as temporary denizens who came for a few years and were unfortunately waylaid by any number of things (such as indebtedness or family problems) but who “will soon be returning to Turkey — for good”. The migrants’ self-definition is consistent overall with the appellation bewstowed on them by Germans — Gastarbeiter. Germans and Turks know that to be a guest is to be temporary, and to be a worker is to fulfil, acknowledge, and legitimise only one dimension of “personness”. The Turks know painfully well their narrowly delimited status which is shaped daily in colloquial language and behaviour. Therefore, an “immigrant Gastarbeiter” would be an oxymoron. Negotiating this paradox on a daily basis surely increases the desire to identify with a place other than the one that refuses legally and socially to accept them, even if it has long since managed to do so while turning a blind eye. Thus the image of Turkey in Gastarbeiter consciousness is a bright one; now distant, now fleetingly close, but always the legitimising, defining referent of their absence.

This idealised view of Turkey infuses the preparations for the annual holiday return trip with a mystique. As migrants prepare for the return to Turkey, they often complain about the huge expenditure that they feel obliged to make. A relatively secure worker’s family, only moderately in debt, might spend up to DM 5,000 (equivalent to US$3,000 in 1987) for summer preparations, including replenishing the family’s wardrobe and filling requests of all sorts — from sports shoes to electronic appliances and silk headscarves. In fact, it has become so costly to return for a summer vacation that some families I met claimed that they could not afford it more frequently than once every several years. They went instead to Spain or elsewhere in Europe where they could ultimately spend far less than they would by returning to their own houses in Turkey.

The long, hot, and uncomfortable trip to Turkey by car is fraught with difficulties, hassles, and often day-long delays at international frontiers. In addition, it becomes an aggressive,

competitive race amongst the tens of thousands of Turkish drivers. In spite of this, as they leave western Europe behind and approach the Balkans — signalling the proximity to Turkey — the travellers' spirits lift and expectations mount. The stresses associated with driving worsen as they go along the roads through the Balkans, but moods lighten in direct proportion to the distance from western Europe. Yugoslavia and Bulgaria feel familiar to Turks, who are aware of the close historical connections between these countries

and their own.[73] The travellers note the similarity of the Balkans — people, food, architecture, ambience, and landscape — to Turkey. They also express great pleasure each time they manage to speak a bit of Turkish with Serbs, Albanians, or Bulgarians along the way, while being amused by the accents.[74]

The marked difference that can be discerned once the Turks leave German-speaking lands behind them is felt and expressed in terms of a burden having been lifted — in their words "nihayet, Almanya'dan kurtulduk!" (at last, we're rid of, freed from, Germany!). Sometimes "Gavuristan" is substituted for Almanya, Germany becoming the "land of the infidels". In addition, Turks feel a comfortable ease and relaxation with the local people, something that rarely occurs when they are Gastarbeiter. Here, in the Balkans, they are foreigners, but not as foreign as they are in Germany; they still are "other" vis-a-vis the Balkan populations, but, to apply Arjun Appadurai's phrase slightly out of context, "it has always been true that some others are more other than others" (Appadurai 1986: 357).

The emotional pitch heightens as the returnees approach Kapikule, Europe's largest international frontier station, at the Bulgarian-Turkish border. Inevitably, a long line awaits the weary, anxious returnees. It is the first shock of many to come; the next will most certainly be the obstacle course at the checkpoints, manned by a series of surly civil servants who provide a baffling set of foils and hurdles which seem to be designed to impede a smooth homecoming. Some of the returnees find themselves caught in a bureaucratic nightmare. They may be informed that their car's papers are out of order, they might be found with contraband (perhaps unknown to them), or they may have neglected to update a visa. Finally, assuming a family of returnees passes relatively unhindered through the checkpoints, they still may face another 24 hours of driving before setting sight on their natal village, for many of the migrants come from south-east Anatolia, not far from the Syrian border.

Once the initial excitement of homecoming begins to wane, the izinli returnees find that the privileged treatment which they have received — as esteemed, long-lost relatives — evolves into something quite different: they have become, willy-nilly, Alamancilar — German-ish, or German-like. Implicitly derogatory in its markedness, in its explicit differentiation from a non-emigrant Turk, the label bears witness to a combination of difference, lack of acceptance, and rejection. It is a distancing mechanism, expressing the ambivalence contained in the same outstretched arms which

greet the returning vacationers, and accept the prestigious gifts, but which also keep them at a socially safe distance. A poem, written by an anonymous Turk in Germany, succinctly expresses this identity conundrum:

Yabancilar derler bize burada

Alamancilar derler bize orada

Anadolum biz kalmigiz arada

Bagrimiza hanger vurma ne olur

Here they call us strangers, foreigners,

There, they call us German-like.

Oh, my Anatolia, we’re caught in between,

Just don’t stab us through the heart.

Their stay in Germany is thought to have fundamentally changed the Gastarbeiter, rendering them unlike the compatriots left behind. Exposure to luxuries is believed to have spoiled them and they might now have become accustomed to running water, bathing facilities, automobiles, punctuality, business-like relations with people, efficiency, and cleanliness of a western sort. These attributes are expected of the returnees, and the relatives and neighbours back in the village often respond with defensively apologetic tones. Eventually the novelty of returning and being home wears thin. As frequent comparisons are made with Germany (e.g. “in Germany it’s cleaner; more efficient; more modern; the civil servants actually work and are honest”), annoyance and tensions rise in the daily interactions with friends and relatives. Hierarchically, the izinli often find themselves having advanced a notch upwards. By virtue of their extended residence in the “First World”,[75] the returnees are expected to take on the role of providers, patrons, and philanthropists, as well as to be exhibitionists, financially successful, and “Europeanised”. As such, they are effectively barred from returning to their former identities and relationships.

The symbolic efficacy of objects in the process of constructing and reconstructing personal relations is of paramount importance during the izin vacation return. The awareness of the expectations of their compatriots back in Turkey exerts a strong pressure on the migrants, and, accordingly, there are many ways in which the Gastarbeiter attempt to fulfil these expectations. For example, they might drive to Turkey in a new car every summer, thus reinforcing the image of the foreign, rich uncle. The poor relations back in the Anatolian village, or in the gecekondu shanty town, sufficiently impressed with the great wealth, only see what is conspicuously consumable. They have no idea about debts, bank loans, hours worked

overtime, unhealthy living conditions, or the social stigma shading the lives of the supposedly wealthy relatives abroad. The demands placed upon the returnees have undergone a rapid and steep inflation.

In the village house of one izinli returnee family, I watched a steady stream of neighbours trickle in, ostensibly to pay their respects and welcome them back to the village. Elderly widows seemed especially eager to stop by for tea; a few came back to read the Qur'an to the family. In each case the visitors left with a gift of some sort, either a German trinket, a scarf, or some cash in Deutschmarks. On the day of the emotionally charged festival of Kurban Bayrami (Feast of the Sacrifice), this family sacrificed three lambs: one for the elderly, sickly grandmother; one for her returned daughter, who was guilt-ridden for "abandoning" an invalid parent; and one for the car and the journey. Blood from this latter sacrifice was smeared on the front of the car. Some of the meat from this animal was brought back illegally to Berlin for neighbours and friends unable to make the journey.

As Alamancilar (i.e. German-like) the izinli returnees suffer from disorientation. Some are convinced that the physical ailments that afflict them in northern Europe can be cured with a trip to Turkey.[76] They have returned home to drink the water, feel the sun, and breathe the air. They have come home to reaffirm their Turkishness, yet they find themselves unaccepted as "normal" Turks. They have become irrevocably marked by virtue of their extended absence from Turkey. Feeling misunderstood and less than appreciated by their compatriots in Turkey, they seek others like themselves. On quite a few occasions in Turkey, I saw individuals and families travel considerable distances to visit friends whom they had made in Germany. With each other they were able to relax, tell jokes in German, and compare experiences. They could relate to one another without the constraints of material and social expectations and obligations demanded by an uncomfortable hierarchy.

The social asymmetry to which the Alamancilar return is a newly forged structure, one not yet free of burdensome scaffolding. The returnees enter a defined set of social relations in which extensive expectations, primarily financial, are foisted upon them. In order to maintain the prestige that they feel is rightfully theirs by virtue of long, arduous years lived in gurbet, toiling to improve the family's lot, they must live up to

the role of spendthrifts and benefactors. This is clearly not without serious consequences, essentially reproducing the necessary conditions for extended residence in gurbet. On the one hand, their “Turkishness” marginalises the migrants in the German context; on the other, the markedness of being Alamancilar in Turkey, the inability to merge back into the Turkish

mainstream, entraps Turkish Gastarbeiter in a circular quest for an increasingly elusive identity. More and more often, the returnees look northward, turning to the symbols, persons, and identifications associated with their lives in Germany in order to find comfort and meaning.

*** The second generation: disorientations

The disorientation of returning migrants proves disillusioning and disappointing because their expectations based on past, often romanticised memories remain unrealised. Their children’s experience of Turkey is slightly different, however, since many of the children, although born in Turkey, have lived there only as small children and are unschooled in its history and norms, geography and civics, military and civil servants, and codes of gender segregation. Though many of them grow up in closed, ghetto-like enclaves in West German cities, they still are often unprepared for what they find when they return. For example, a girl who in Stuttgart is accustomed to travel alone to school or work on public transportation may suddenly find herself shamed and embarrassed for leaving her family’s village house without a male relative to escort her. Alternatively, parents who are protective of their daughters in Germany, and unwilling to allow them much liberty, may give them free rein to socialise with other young people once they are in the safety of their natal village. In one Anatolian village where the Turkoman population was sedentarised two generations ago and approximately 25 per cent of the population now lives in Germany, it is common to see teenage girls and boys openly socialising in the streets, riding motorcycles together, and holding unchaperoned dances until early morning hours. This situation — which is admittedly rather exceptional — contrasted sharply with a town not ten kilometres away, where even a middle-aged, respected, married woman (to say nothing of an unmarried girl), reluctant to expose herself to any unnecessary public scrutiny, will send a 6-year-old neighbour boy to the local oven to buy her bread.

Predictably, young people who return experience painful and disturbing cognitive and behavioural dissonance. For instance, a 15-year-old boy related how shocked he was when he was beaten by male relatives of female schoolmates with whom he had been seen chatting. Teenagers have a particularly difficult time adapting to the mores and rigid hierarchical system prevalent in Turkish schools. They are punished for infractions unknowingly committed — such as not wearing their prescribed uniform properly, leaving a hand in a pocket when a teacher walks into the room instead of standing to attention, or using the informal sen (“tu”) form of address with a teacher instead of the mandatory siz (“vous”). Older girls complain of being ostracised, since their

peers assume they are not virgins by virtue of their connections with Germany — a land associated with infidels, immorality, and promiscuity.

Whereas their parents have many and specific expectations of Turkey, the children's notions are few and vague. Most of the second-generation children in Germany can recite by rote: "We are in gurbet; we will soon be returning to Turkey, things are better for us in Turkey, we are foreigners here, and it is always best to live in the father/motherland, the vatan". Even children whose concrete memories of the vatan are hazy at best, grow up hearing these collocations constantly, and repeat them. Yet despite the lip service acknowledging their exiled existence, they have been socialised in Germany, albeit as Turks. For them, Turkey is a distant memory, almost a myth. Increasingly, Turkey is acquiring the status of a vacation land for them, the holiday spot which it is for the thousands of Germans who travel there each year.

In the past several years, many izinli returnees have altered the itineraries of their summer visits, and now include holiday villages and resorts on Turkey's spectacular Aegean and Mediterranean coasts. Some of the financially more secure Gastarbeiter, after completing retirement homes for themselves in villages, towns, or cities, have invested in holiday homes. Therefore, migrants — and their children — come to see an added dimension of Turkey, and see it now as a spot for amusement, fun, vacationing, and spending money. Many have never travelled within Turkey before, for the concept of izin only meant seeing and spending time with relatives. A vacation in the European sense has until recently been an alien concept for them. With the advent of their new European- or German-style vacations, they are in effect beginning to appropriate the German concepts of time, work, place, and leisure. Since vacation time is peripheral to the work year, it follows that the place of vacation is marginal to the work-place, which assumes centrality in the lives of workers.

*** Migration and Islam

In recent years, the so-called "Islamic revival" has come under scrutiny in western Europe. Public and private monies are being allocated in order to identify the extent, types, and nature of what is commonly misperceived as a monolithic, nascent, European Islam. For the Turks, well-entrenched networks sustain and regulate the international movement of personnel through whom

often competing Turkish and Islamic identities are fostered and kept alive abroad. A bilateral agreement permits the Turkish Ministry of Education to send Turkish teachers to the Federal Republic of Germany to teach public-school courses in Turkish history, culture, and civics. (Turks already living abroad also teach.) These teachers have generally tended to be staunch supporters of the military regime and Kemalism. By definition, they are laicists.[77] A lively competition for control of the indoctrination and education processes of the second

generation has thus ensued, compounded in 1987 by a major scandal that broke in Turkey. Saudi Arabian money was linked to key officials in the Turkish government, specifically intended to support the export of religious education to West Germany.[78]

Indeed, many Turks in West Germany were already observant Muslims in Turkey prior to their migration. For many, however, it is the foreign, Christian, and German context that provides the initial catalyst for active involvement in religious organisations and worship. One interpretation of this increased identification with Muslim symbols and organisations is that the popularity of Islamic groups and identifications is a form of resistance against prevailing norms of an alien society, a society commonly perceived of as dangerous, infidel, and immoral. In this view, the migrants' distance from Turkey and their feeling of marginality — not only with regard to Turkey but also to mainstream German society — provide the context for these newfound religious sentiments, which might not have been relevant had the migrants remained with the mainstream in Turkey.

Questions of legality, power, and authority also enter into the picture, if we consider that a great deal of the organisational, preaching, and educational modes that are widespread in West Germany would be clearly illegal in Turkey.[79] For Turkish Sunnis in West Germany, the distance from Turkey ensures freedom from legal constraints, while Turkish Alevis also find in the diaspora an environment conducive to expressing their Alevi identity free from what they perceive as the pressures of a Sunni-dominant, repressive, hegemonic order in Turkey. Thus, embedded in the process of the dual marginalisation — both from Turkish and German societies — of migrant Turkish Alevis and Sunnis are the seeds from which may be observed the blooming of alternative expressions of "reimagined" (Anderson 1983) Islamic identities.

Turks in western Europe take great care to prevent the moral contamination that they believe threatens them, particularly in the form of haram (forbidden) meat — i.e. pork. The Islamic dietary laws, nearly forgotten in Turkey, have moved to the forefront of concerns in gurbet. Clever entrepreneurs have used the fear of haram to their advantage, and have had great success with their helal industries, which sell everything from helal sausage to helal bread. The explicit association which many Turks make between pork consumption and promiscuity lends still greater fervour to the conspicuous avoidance of German food, restaurants, grocery stores, and butchers.[80] In a country such as Germany, where pork products are an important dietary staple, the adamant Turkish avoidance of pork is sometimes interpreted negatively by German natives as a type of social and cultural rejection, a refusal to integrate and to accept prevailing norms.

Moreover, the overt anti-Muslim sentiment prevalent among Germans is, naturally, resented by religiously observant Turks. This sentiment is manifested in a variety of ways — from the forcible removal of girls' headscarves by public-school teachers, to public mockery or ridicule, to the various strategies employed to oppose and undermine Qur'anic schools. The kopftuch (headscarf) debate continues as a heated issue, more among

Germans than Turks. Many Germans feel offended by seeing Turkish women and girls with their heads covered. Ironically, the left (particularly feminists) and the right have united in their categorical opposition to the wearing of scarves. Though articulated and rationalised differently — it is variously described as “ugly”, “backward”, “un-German”, “sticking out”, or symbolic of sexist, patriarchal dominance and repression — the message is the same. In a self-consciously blatant Christian society, albeit dually denominational, it is not surprising that non-Christians may react by feeling unaccepted and marginalised (see Mandel, 1989). [81]

Although Turkish parents (particularly Sunni) commonly feel threatened by the encompassing Christian, permissive society and its potentially corrupting influence on their children, the reactions of the second-generation children can take different forms. For some, years of intensive indoctrination at Qur’an schools and the mosque outweigh other forces and influences. But teenage girls in particular often respond to the religious resistance of their parents with a counter-resistance of their own. For instance, as soon as they are out of sight of their own homes, they may shed the “Islamic” garments that their fathers force them to wear, and adorn themselves at school with make-up, fashionable mini-skirts, and the like.

In interviews with repatriated migrants in Turkey, I was told a number of times by informants that it was in Germany that they became religious; only there did they begin wearing ba§ ortusu (the headscarf) and attending mosque. Many Sunni informants also

related how they met their first Alevi in Germany. Anti-Alevi prejudices migrate along with the Sunni Gastarbeiter, and although in some instances these prejudices may be overcome by direct contact, these are generally thought of as exceptions and are not applicable to the general group. The deeply ingrained Sunni beliefs about the alleged immorality, ritualised incestuous practices, and impure nature of the Alevis determine a significant dimension of patterns of differentiation and affiliation within the Turkish community. This is most evident in the marriage partners chosen by second-generation young people, who rarely marry outside sectarian boundaries.

For centuries in Turkey the Alevis have been the underdogs, often perceived as a fifth column in the Ottoman Empire, as they occasionally sided with the Shi‘i Safavis.[82] In Republican times, Alevis have had more than their share of massacres, oppression, and deportations. This extends to the present day, when to identify oneself as an Alevi is an unambiguous identification with the political left — a difficult and dangerous position since the 1980 military coup d’etat. The problems that the Alevis face in Turkey are reflected in their disproportionate over-representation in the migrant diaspora. Moreover, the tense, repressive state of martial law in several largely Alevi and Kurdish provinces in eastern Anatolia makes itself felt in the lower incidence of repatriation of Alevis to Turkey compared with Sunni migrants.

Within and between Alevi communities various patterns of movement among members of holy lineages have long been an expected way of life. The itinerant holy man, the pir or dede (spiritual leader, descended from a holy lineage) typically wandered much of the year, travelling from one group of his talip followers to the next, and leading ayin-i cems (the secret communal AleviBektasi ritual of solidarity and “collective effervescence”, involving song, music, and dervish trance dancing, as well as a reenactment of the martyrdoms of ‘Ali and Huseyin [Arabic, Husayn]). In addition, the pir can legitimately demand tribute from the talip, which may assume many forms. Historically, we know that the pir served as the locus of intra- and inter-regional communication and was at key times a crucial link in political networks. Often a central figure in opposition movements, he was able to rally followers due to his legitimacy and success as a pir, and to convey information.

In the context of contemporary migration, this practice of the itinerant priest, travelling to Alevi communities to conduct the ayin-i cem and collect tributes, is maintained, transformed, and might even become the locus of serious intra-Alevi tension and controversy. Elsewhere I have written about an Alevi-Bekta§i cem in West Berlin that fell apart in its final moments (Mandel 1986). In that case, the schism ostensibly stemmed from a disagreement between most of the participants and the officiating dede over the appropriateness of a particular song’s inclusion at the end of the cem. The dede, who had been flown in from Ankara, wanted to forbid the song, written by Pir Sultan Abdal, on the grounds that it was “political”.[83] For the majority of the Alevis there, already alienated from the dede for what they felt to be other offensive behaviour, this was the final, backbreaking straw, inciting the minor rebellion that followed.

Migrant Alevis have in many ways successfully reversed their hierarchically subordinate position to the Sunni Turks. They point to what they see as their more “democratic, tolerant, and progressive” stance. While steadfast in their “Aleviness”, they identify with and admire many aspects of West German society that the Sunnis interpret as threatening. Modelling themselves on certain German, western modes, they pride themselves on how modern they are, as opposed to the “backward” Sunnis. They point to the village clothing which many Sunni women wear, such as their flowing §alvar pants and headscarves. Also, the Alevi practice of not attending mosque, perhaps along with some of the aspects of the practice of taqiyya (dissimulation) which characterise them, together serve to raise their status in the eyes of Germans. Finally, Alevis tend to be more politically engaged in leftist politics than Sunnis, and through such activities have greater contact with Germans. Though still peripheral with respect to Sunnis, the Alevis might be slightly less marginal (i.e. more integrated) than Sunnis with respect to mainstream German society.

The Alevis, in their consistently heterodox (from the Sunni perspective) stance, have always been inherently “political”, even though it was not until the 1970s that the Alevis consciously began to identify themselves as a group, and organise themselves as a formal political party — now outlawed (Mardin 1980: 186–7). Today in western Europe several Alevi groups conceive of themselves in explicitly political — and national — terms. Perhaps the most extreme, a group calling itself “Kizil Yol” (or Red Path), advocates the founding of “Alevistan” (or a nation of Alevis). Taking its model from the struggles of Kurdish separatists for the establishment ofan independent Kurdistan, these followers of the Red Path are criticised by some on the grounds that Alevilik (Aleviness) is a religion, not a nationality. Most Alevis would surely not support this nationalist expression of Alevilik, and Kizil Yol is far from representative. None the less, the notion of “Alevistan” is compelling, for it suggests the emergence in the diaspora of a

consciously discrete identity (here influenced by the discourse of western nationalisms) which gravitates around a fantastic centre.

While the Alevis abroad are doubly marginal with respect to both Germans and Sunni Turks, their relative position vis-a-vis Sunnis has undergone a transformation. In West Germany, the reference point of Sunni dominance becomes less and less relevant. Alevis, who had defined themselves primarily in opposition to Sunnis, and always in reference to them, have in some respects gradually replaced the latter with Germans in the process of identity construction. Furthermore, Alevis in Germany have the freedom to adopt a more inward, communal orientation, unfettered by past political and social constraints.

*** Displaced centres, emerging identities

Among other things, this chapter has shown how the experience of migration affects different articulations of Islam among expatriate Turks. Not only do Alevis and Sunnis confront the foreign context in very different ways, but their relations to each other are undergoing a transformation in the light of their respective interactions with German society. To a large extent, the separate Sunni and Alevi value systems and histories are reproduced in the second generation, reflecting the different patterns of socialisation in each group. These different patterns of socialisation influence the overall future orientations of Sunni and Alevi youth towards Turkey and Germany.

Migrant parents soften the daily blows of gurbet by telling stories to their children, painting for them the contours and shades of a land that they will never see since it does not exist apart from in their stories. They sweeten the bitter present with the elusive saccharin future, which is, to be sure, a revisionist, romanticised projection of a past. A vicious circle of sorts reflects the migratory cycle itself and eventually results in a situation in which the centre finds itself wherever the migrant is not, be it Turkey or Germany. No given locus can be the totalising centre for long. The migrant’s marginality in both Turkey

and Germany precludes his or her full identification with either place. This displacement is exacerbated by the fact that in either place migrants partially define themselves in relation to the values and symbols of the other locale, which are ubiquitous even in its absence.

The izin vacation trip to Turkey is the event that crystallises this conundrum. In the idealisation of Turkey and in the drive there, the crescendo of a southward identification builds up, only to be foiled by the anti-climatic reception in the homeland. From the

vantage point of Turkey, Germany then becomes the salient place of reference — that is, until the trip back. Thus, an undercurrent of disaffection and dissatisfaction informs the migrant's experience.

Ultimately, the annual izin trip home neither provides an opportunity for collective solidarity with compatriots, nor offers an infusion of the stuff that reinforces identity. Rather, it furthers the alienation resulting from the absence of an attainable centre in the lives of Gastarbeiter. In a twist to Benedict Anderson's call for a rethinking of our tendency to reify nations and nationalisms in our act of imagining them (Anderson 1985), here it seems that the Alamancilar have been imagined by their compatriots back home, objectified and distanced by the latters' expectations and projections. Yet the annual circular choreography that patterns the migrants' lives contributes to reproducing the Alamanci identity of marginality. Thus, as Gastarbeiter in Germany they cannot escape their Turkishness, and, conversely, they become Alamancilar ("German-like") in Turkey, where they had hoped to be Turks.

*** Acknowledgements

I would like to acknowledge the valuable suggestions and editing generously offered by Mariane Ferme during the writing of this chapter. Also I would like to thank Robert Dankoff for his advice in the Turkish translations. The remaining faults or errors remain, of course, my responsibility.

[71] This chapter is based on research data gathered in Turkey, West Germany, and West Berlin. Between the years 1980 and 1986, I spent over two years in Turkey and eighteen months in the Federal Republic of Germany, conducting research as a participant observer on several aspects of the migration cycle.

[72] With the exception of one forty-minute programme, called “Turkiye Mektubu” (“Turkey Letter”), broadcast each fortnight as part of a Second-Channel weekly programme, “Nachbarn in Europa” (“Neighbours in Europe”), there have been no Turkish television programmes in West Germany. On the rare occasions when Turkish movies are shown on television, they, too, are out of linguistic reach of most Turks, since they are dubbed into German rather than sub-titled. It is the exceptional Turkish migrant family that does not have a VCR, and the Turkish video industry abroad is booming; West Berlin boasts perhaps seventy Turkish video shops. However, the recent introduction of cable television may change the viewing habits of Turkish families, and there is now a nightly Turkish cable-radio broadcast from Cologne.

Not only is most socialising carried out with other Turks, but preferably with Turks who, if not relatives, identify with the same region of the country, speak the same language (many of the migrants speak one of two Kurdish languages), and affiliate with the same expression of Islam — be it Sunni, Alevi, or one of the many tarikats (religious orders) active in Germany.

[73] Due to recent unfortunate incidents affecting the Turkish minority in Bulgaria (ostensibly of an anti-Muslim nature), some Turks have felt apprehensive about driving through the country. However, the apprehension was not serious enough to warrant any change of plans. No one with whom I spoke was willing to opt for the alternate route through Turkey’s adversarial NATO ally, Greece, despite the fact that the road through northern Greek Macedonia and Thrace passes through the heartland of Greece’s Turkish minority.

[74] Turkish still serves as a lingua franca in many parts of the Balkans that were under Ottoman rule.

[75] I use this term with reservations, following Carl Pletch’s criticism of the three-world theory. However, in the present case the informants themselves perceive Turkey as backward and underdeveloped in contrast with the west, which is always the point of reference. Their perception of the hierarchical relations is expressed as an unambiguous Eurocentricity.

[76] A new field of medicine, Gastarbeiterkrankheit, has emerged in West Germany. In western Europe, Turks claim to experience physical and emotional ailments never known before migration — a complex series of what we would call psychosomatic and psychological illnesses (see, for example, Edinsel 1984).

[77] Not all European host countries follow West Germany’s example. The Netherlands, for instance, has had altercations with Turkey over this issue, since Holland refuses to admit Turkish textbooks and teachers into its school system. Instead, in an effort to address the

migrant situation, Holland has commissioned its own, custom-tailored texts, which are taught by resident Turks. The Dutch object to the pedagogic content and level in the material from Turkey, and claim that through the official books and teachers sent from Milli Egitim (the Ministry of Education), Turkey is merely exporting political propaganda with which the Dutch government does not wish to be associated. West Berlin commissioned and has recently instituted a new, controversial set of Turkish textbooks for grades 1 through 8. They were written and illustrated by Turkish intellectuals residing in West Berlin and contain a great deal of literature and references that are banned in Turkey.

[78] Not unrelated are findings that trace massive amounts of presumed Saudi money entering Turkey via Germany to support popular religious orders in Turkey whose social, economic, and educational networks operate by means of an elaborate patronage system. Some sociologists in Turkey have been conducting research on the links and functioning of this sophisticated and highly efficacious patronage system.

[79] For example, the maps and pictures decorating the walls of a well-established Qur’anic school in West Berlin are of the Ottoman Empire and the Ottoman sultans; none represents the Turkish Republic or Mustafa Kemal Ataturk. Much of the preaching that takes place in mosques in Germany is of an explicitly political nature, prohibited in Turkey.

[80] I became aware of this after having been asked by Turks on numerous occasions if I ate pork. The intensity of their concern led me to pursue the issue, and in many cases the act of eating pork or abstinence therefrom served as the demarcation line between acceptance as one of “us” and rejection of “them”. The way it is often phrased, “domuz kiskanmaz” (“pigs are not jealous”) euphemistically signifies that pigs are promiscuous animals, not monogamous, and that therefore those who partake of pork also become promiscuous, shameful, lacking in honour and virtue. It is the moral extension of “you are what you eat”.

[81] A parallel battle is raging in Turkey conducted by Muslims who would like to see the wearing of the headscarf legalised in the schools (it has been banned since the time of Ataturk). This issue has become highly politicised and has been the source of intense strife, strikes, and protests. A scandal involving the former prime minister’s brother revolved around bribe money paid to women university students if they agreed to wear the scarf.

[82] The Alevis are not a homogeneous, monolithic group. They fall into at least four different language groups — Turkish, Arabic, Zaza, and Kurmangi. The latter two are Iranian and Kurdish languages. In western Anatolia most Alevis are formerly transhumant Turkoman; many in the east call themselves Kurds, or are labelled Kurdish by others.

[83] Pir Sultan Abdal, a sixteenth-century pir, is revered today as an Alevi folk hero. The eloquent, mystical, politically charged poetry and music he wrote, in the semah dervish style, has been kept alive by Alevis since his death. Considered a threat to the Ottoman regime, he died by hanging in 1560 during the reign of Suleyman the Magnificent. The power of the songs has not diminished through the centuries, as the Berlin cem incident made clear.

* Part Four: Saints, scholars, and travel

** Chapter Nine: Pedigrees and paradigms: scholarly credentials among the Dyula of the northern Ivory Coast

Robert Launay

The Hijaz in particular and the Arabic-speaking Middle East in general have always constituted points of reference for Dyula Muslims.[84] At the most basic level, Arabic is the obligatory language of prayer and the hajj an obligation for those who have the means to peform it. Not only the Qur’an but the vast majority of commentaries, legal texts of reference, and personal prayers are written in classical Arabic — an entirely foreign, quintessential^ written language, totally unrelated to the Manding language spoken by the Dyula. The ability to read and to write Arabic were necessary conditions for accession to the status of karamogo, or “scholar”. Travel for the purposes of study was a common means of acquiring knowledge of Arabic as a language and of written texts.

Indeed, the Dyula of the northern Ivory Coast have always valued travel positively. The word dyula also means “trader”. Formerly the Dyula, as a Muslim minority living amongst “pagan” Senufo, enjoyed an ethnic monopoly over various sectors of both intra-regional and long-distance trade. For individuals involved in commerce, travel was an integral part of the process of making a living. As for religious learning, it was by no means remarkable for younger scholars to travel outside their home communities to pursue their education with more knowledgeable or prestigious teachers. Likewise, scholars from established centres of learning travelled to smaller or more distant communities where they might outshine potential rivals and establish a firm and profitable local reputation.

It is hazardous, however, to make an a priori assumption that travel and study in the Arabic-speaking Middle East was the most prestigious form of travel — for study or for the dissemination of ideas. Just as Dyula traders were anxious to maintain control, if not a monopoly, over access to trade goods, so Dyula scholars were concerned to maintain control over access to knowledge — the equivalent of goods in the spiritual and intellectual realms.

Knowledge, in this sense, is not simply that which one knows. More crucially, it is the authority with which one speaks or writes. Such authority depends in part on what one has studied and with whom. Claims to superior knowledge, on the grounds that one has studied directly in the Middle East, may constitute a challenge to the authority of local traditions of scholarship. In the last resort, the exercise of intellectual authority is just as much a question of legitimacy as the exercise of political authority. Like political authority, one can attempt to monopolise it, but the success of such attempts depends — even more than in politics — on the attitudes of one's constituency.

The authority of scholars ultimately derives from their expertise in religious matters. The scholar's role in Dyula communities thus hinges first of all on notions of what Islam is and what it means to call oneself a Muslim. Since the nineteenth century, these notions have changed in important ways, and even in the nineteenth century were subject to debate. Controversies about the legitimacy of locally-trained as opposed to foreign-trained scholars are also controversies about different conceptions of Islam and of "being Muslim". In order to evaluate and understand these controversies, it is necessary to establish an historical baseline, albeit a tentative one.

*** The Suwarian tradition among the Dyula

Until the mid-twentieth century, Islam among the Dyula was predicated on the notion that all Dyula were Muslim and that, locally, most others (particularly Senufo) were bamana, "pagans". Supra-locally, the Dyula were in regular contact with other West African Muslim communities, usually Manding-speakers like themselves. Local Dyula were divided into two hereditary categories: tun tigi and mory. Tun tigi were associated in principle with warfare and with the exercise of political power. Adolescent males were initiated into lo societies, involving masquerading and blood sacrifices (jo) to various spirits. Tun tigi were not expected to abstain from alcoholic beverages, to fast throughout the month of Ramadan, or even to pray regularly five times a day. Mory, on the other hand, were expected to conform with reasonable diligence to the strictures of the shari'a, and adolescent males often received at least rudimentary instruction in reading and writing Arabic. Ideally, the occupations of mory were trade and scholarship rather than warfare and politics. These categories, it must be stressed, were hereditary; they applied to entire clan wards (kabilas) and not to individuals. Individuals could and did engage in occupations that were more typically associated with the opposite category. Religious practices might also vary on an individual level, at least among

the tun tigi; since all Dyula were Muslims, it was meritorious, but hardly obligatory, for individual tun tigi to emulate mory standards of piety.

The common religious identity of all Dyula, mory and tun tigi, was most fully expressed in certain rituals: the slaughter of sheep on Tabaski, the annual sacrifice during the month of the hajj; singing and dancing during Ramadan and on donba (the Prophet's birthday); and the manner of observing various life-crisis rituals — naming, weddings, and funerals. Performing these rituals on the required occasions in the proper manner was one central feature of "being Muslim", although the authority for performing them in this manner did not necessarily rest in the prescriptions of written religious texts. On the other hand, outward signs of piety — prayer, fasting, abstaining from alcohol and from blood sacrifices — were not in and of themselves hallmarks of a Muslim identity. At one level, such manifestations of piety were typical only of mory, and not of all Dyula Muslims, although at another level they represented an ideal standard of behaviour which all Muslims might choose to emulate. Scholars were responsible for establishing these standards of piety — obligatory in principle for all mory and to some extent ideal for tun tigi. Their command of Arabic provided them with access to the written texts, which furnished the necessary guidelines for behaviour. They were also expected to set a personal example of piety for others to follow.

There was a tendency for scholarship to be a hereditary occupation. Whole clan wards, or a section of a large clan ward, might specialise in scholarship in any given community. In this way, each village tended to have a few, usually quite small, specialised scholarly families. None the less, any Muslim man might choose at any time to pursue his studies at an advanced level and accede eventually to the status of karamogo.

Both the extent of a person's religious learning and the degree to which he was expected to demonstrate this learning in his own pious behaviour corresponded ideally to the circumstances of his birth — as a tun tigi or mory (i.e. a member of a scholarly lineage or not). However, accession to the status of scholar involved the conferring of a second pedigree, intellectual rather than hereditary. This isnad was very much like a genealogy. The Dyula words for teacher and pupil are karamogo fa and karamogo den, literally "scholar father" and "scholar child". The authority of a scholar ultimately derives from his possession of such a pedigree, which places him in a line of teachers and pupils. If one examines any

such isnad, one notices that the line of teachers extends literally all the way to God, the ultimate source of knowledge and moral authority. Beneath God, a number of angels are also listed as teacher and pupil before this knowledge is transmitted to humankind in the person of the Prophet. The name of Malik ibn Anas (AD 715–95) is also on

every such list among the Dyula, as they all belong to the Maliki school of jurisprudence. More important, the Dyula isnads all converge on the name of al-Hajj Salim Suware, who lived in the fifteenth century.[85] The line of transmission from Malik to al-Hajj Salim is clearly abbreviated, as it contains only six names, including two identifiable ninth-century scholars: ‘Abd al-Rahman ibn al-Qasim of Cairo and ‘Abd al-Salam Sahnun of Qayrawan (Wilks 1968). The convergence of isnads on the person of al-Hajj Salim is by no means a peculiarity of the Dyula of the northern Ivory Coast; his influence was so decisive, in a belt that runs from Guinea (Hunter 1977; Sanneh 1979) to northern Ghana (Wilks 1968), that it is perfectly reasonable to speak in terms of a “Suwarian tradition”[86] in West African Islamic scholarship.

This widespread convergence of isnads conveys a symbolic message about the nature of knowledge and the authority derived from its possession. God and the angels are the ultimate source of knowledge and moral authority. However, in terms of “this-worldly” geography, knowledge stems first and foremost from the Hijaz (from the Prophet to Imam Malik), then derivatively from Arabic-speaking northern Africa (Cairo, Qayrawan), and finally from the person of al-Hajj Salim, before diverging into various lines. In short, if the Arabic-speaking world is the ultimate earthly source of knowledge, access to this knowledge is mediated by a regional tradition of scholarship; it is not acquired directly at, or closer to, its source.

The Haidara scholars of Kadioha and Boron are a case in point. The Haidara are universally acknowledged in the region as sharifs, direct descendants of the Prophet. A putative Middle Eastern origin is not at all unusual among the Dyula. Various clans privately claim descent from one companion or another of the Prophet, admittedly without providing any genealogical evidence, or have oral traditions about the dealings of their “ancestor” with the Prophet, and how in one way or another they were loyal Muslims from the very beginning. Such claims symbolically anchor the clans in space (the Hijaz) and time (the Prophet’s lifetime), but they are not socially relevant for regulating inter-clan relationships. Unlike such stories, the Haidara claim falls into the domain of common knowledge. Even so, the Haidara isnads also converge on al-Hajj Salim; although they can effectively claim a direct hereditary link to the Prophet, their intellectual pedigree, like that of everyone else, hails from West Africa and from al-Hajj Salim.

Al-Hajj Salim’s scholarly activity was centred on the town of Jagha in western Sudan, but his influence was greatest along the southern fringes of the Manding trade network, and corresponds to the period of the disintegration of the old Malian empire. This was a region in which such Manding-speaking Muslims as the Dyula lived as a minority among various groups of “unbelievers”. The tradition of scholarship founded by al-Hajj Salim stressed the religious co-existence of these two categories — Muslims and unbelievers — with the attendant separation of religion and politics. No active attempts were made to proselytise unbelievers, and militant jihad was avoided. It would be a serious misconception to label this tradition as “pacifist”, however. Warfare, whether with Muslims or unbelievers, remained a distinct possibility. Rather, the Suwarian approach was neatly mirrored in the Dyula distinction between the hereditary categories of tun tigi

and mory, those whose business was ideally warfare and politics and those whose business was ideally religious scholarship. Relations between the Dyula and their “pagan” neighbours might range from open hostility to active alliance, but in no case was religion a deciding issue. The Suwarian tradition not only fostered the development of relatively peaceful co-existence between Muslim minorities and their neighbours, but also sanctioned the existence of different hereditary categories within the Muslim community itself — making outward piety an obligation for some Muslims (especially scholars themselves), but only an ideal for others.

*** The first challenge: militant jihad

In short, the Suwarian tradition incorporated a number of basic distinctions between politics and religion, hereditary and intellectual pedigrees, the Hijaz as the ultimate source of knowledge and moral authority and a local tradition of scholarship. Beginning in the late eighteenth century, comparable traditions of Islam and Islamic scholarship were subjected to challenges in much of West Africa in the form of militant jihad movements. Several of these movements attempted to draw their legitimacy from direct study in the Hijaz as opposed to local scholarly traditions. ‘Uthman dan Fodio’s teacher, Jibril ibn Umar, studied in the Hijaz (Hiskett 1973), as did al-Hajj Umar Tall (Robinson 1985). It would be far too simplistic to explain the jihad movements exclusively in terms of the diffusion of ideas from the Middle East to West Africa. The hajj itself, especially combined with study in the Hijaz or elsewhere

in the Middle East, constituted a different principle of legitimacy, an alternative source of intellectual and moral authority. Under certain circumstances, it could be explicitly opposed to the authority of local scholarly traditions.

The hajj has always been a powerful Islamic symbol among the Dyula. Until recently, the journey itself was exceedingly long, hazardous, and difficult. Indeed, I know of no individual at all from the Korhogo region who successfully completed the journey before the twentieth century. On the other hand, I was shown a manuscript list of various illustrious Manding scholars who had accomplished the hajj. Twelve scholars are cited in all, hailing from various communities in Mali and particularly in Guinea and the western Ivory Coast. Not surprisingly, al-Hajj Salim Suware headed the list. This list hearkens back to a sort of “golden age” of Islamic scholarship in the region, when scholars were in direct contact with the Hijaz and when the Suwarian tradition itself came into being. After this era, the hajj became an ideal rather than a reality. For example, the Cisse of Kadioha relate that their ancestor, Mammadu, left his native town of Bakongo in Guinea to undertake the hajj. Along the way, he stopped in the village of Kadioha, where he was finally persuaded to abandon his pilgrimage and to settle instead. Whether or not the story is true, the ancestor is remembered for his piety, not because he accomplished the hajj, but rather because of his intention to perform the journey. The hajj, situated in the distant past or in terms of intentions rather than

accomplishment, constituted a symbolic link between the Dyula and the ultimate source of their faith, much as did the claims of various clans to descent from companions of the Prophet. But it did not necessarily represent an alternative source of moral authority.

This is not to say that the hajj was never used as a challenge to the authority of the Suwarian tradition. The career of al-Hajj Mahmud Karantaw among the Kantossi of the Volta Basin, to the east of Korhogo, provides an interesting example.[87] The Kantossi, like the Dyula, were a Muslim minority of Mande origin living in the midst of “unbelievers”. Mahmud studied with local teachers and was trained in the Suwarian tradition before undertaking the pilgrimage. During his journey, he stopped to study in Syria with a Qadiri teacher, Shaykh ‘Abd al-Rahim, who persuaded him to undertake a jihad on his return. This jihad against neighbouring “pagans” was launched in the mid-nineteenth century. Al-Hajj Mahmud attracted some support, both among his fellow Kantossi and in the nearby town of Wa, a major centre of Muslim learning in the region (Ivor Wilks, personal communication). With this army, he was able to conquer some of the surrounding area and to found the polity of Wahabu. However, Muslims in the area were strongly divided over support for the jihad, with the majority opposing Islamic militancy and favouring the maintenance of friendly relations with neighbouring “pagans” — whether on moral, political, or commercial grounds. Ultimately, the movement was a very limited success, and Wahabu was limited to a small cluster of villages.

Al-Hajj Mahmud’s movement demonstrates, first of all, that peoples like Dyula belonging to the Suwarian tradition were aware of and not always impervious to the jihad movements that swept through much of West Africa. Second, like a number of other jihad leaders, al-Hajj Mahmud sought legitimacy through a direct appeal to study in the Arabic-speaking world, effectively attempting to supersede the mediating role of local scholarly traditions. Finally, this attempt, though not entirely a failure, did not win the support of the vast majority of local Muslims, both scholars and ordinary believers, who continued to affirm their loyalty to the Suwarian tradition. Such loyalty was hardly surprising. Not only were they outnumbered ten to one by their “pagan” neighbours, but they were also more heavily involved in local as opposed to long-distance trade, and they relied on their Senufo neighbours both as customers for their wares and as suppliers of food for purchase in the market place. A jihad movement would have been a dangerous gamble, calling into question their relations of co-operation with their neighbours, which the Suwarian tradition legitimised. However, the Dyula were well aware, not only of the existence of jihad movements, but also of the religious issues involved in either supporting or opposing them. The absence of such movements in the Korhogo region cannot be taken as a sign of inertia, of an unquestioning respect for the force of religious tradition, but rather as a deliberate confirmation of the principle that religious authority, though it might stem ultimately from the Hijaz, was to be mediated by established local lines of scholarship rather than by a direct appeal to contemporary teachings in the Arabic-speaking world.

*** The second challenge: the “Wahhabi” movement

The imposition of French colonial rule was to lay the groundwork for the redefinition of what it meant to be Muslim among the Dyula. Consequently, they had new grounds for calling the Suwarian tradition into question. French rule in and of itself did not constitute a major problem within the Suwarian tradition.

Before the colonial period, the Dyula had accommodated themselves quite well to being ruled by non-Muslims. Given the principle of the separation of politics and religion, it was expected that scholars would profess outward loyalty to whatever regime was in place, although other individuals were free to support or to oppose it as they saw fit. Rather, the social, political, and economic changes that ultimately accompanied French rule were to transform society and consequently the place of scholars within it. In the first place, the pax colonia abolished pre-colonial patterns of warfare and rendered the warrior functions of the tun tigi obsolete. At the same time, it opened new avenues for trade in the south of the Ivory Coast — not only for the Dyula but also for other trading groups, who were often better able to exploit these new possibilities. Dyula from Korhogo began to migrate in substantial numbers to the south — where kola nuts (a major trade good) were grown, and where there was a ready market for livestock, cloth, and other commodities. At the same time, the village of Korhogo was chosen as the major administrative centre for the entire northern region of the Ivory Coast, eventually attracting a stream of migrants in its own right. The development of rail and motor transport, by revolutionising patterns of African trade, marginalised the strategic importance of communities along trade routes in favour of those situated directly near centres of production or consumption, and also concentrated trade in the hands of large-scale traders. In the towns of the south, the Dyula immediately found themselves in direct contact — and in competition — with Muslim traders from elsewhere. As a plantation economy developed in the south, the north, and Korhogo in particular, became important as a source of both migrant labour and staple foods. Korhogo began to attract ever more substantial numbers of immigrants, mainly Senufo from outlying areas but also individuals from neighbouring countries, many of them Muslim and often Manding-speakers like the Dyula.

By the middle of the twentieth century, the Dyula of Koko, descendants of the original Dyula inhabitants of the town, found that their situation had altered radically in a number of respects. First of all, they had lost all pretensions to a monopoly over trade in the region. Second, they were no longer in a position to assimilate new Muslim immigrants to Korhogo, as they had in the past. While they retained the “ownership” of the town’s Friday mosque, they no longer enjoyed a monopoly over Islam. Formerly, trade, Muslim identity, and membership in the Koko Dyula community all coincided in Korhogo. Now, these three features became dissociated. A Muslim identity remained a pre-condition for entering the sector of local trade. However, the relationship between trade and Islam changed in a crucial if not immediately obvious manner. In the past, Muslims, defined in terms of their Dyula ethnic identity, had monopolised trade. Now, non-Muslims could enter the trade sector by converting to Islam. Growing numbers of Senufo “pagans”, beginning with the chief of Korhogo himself, converted to Islam, especially within town.

These conversions were partly responsible for changing the symbols of Muslim identity in Korhogo. In the past, a Muslim was one who belonged to a Muslim community and affirmed this identity by participating in the performance of communal rituals on Muslim calendar holidays and at the time of life crises. Now, new converts might adopt Islam individually without renouncing their membership in communities which also included unbelievers. Their newfound Muslim identity was most conveniently expressed through the adoption of outward forms of piety — praying, fasting, etc. — once typical of Dyula mory but not of tun tigi. Such forms of piety were recognisable signs ofan Islamic identity anywhere, outside as well as within the region. Consequently, Dyula tun tigi were increasingly attracted to mory forms of piety. Their former role as “warriors” was obsolete. Initiation into the lo societies constituted a drain on the time and financial resources of younger men — who, during and just after the Second World War, refused en masse to participate. The lo societies were abandoned, and the tun tigi/mory distinction ceased to be socially salient. Calendrical and life-crisis rituals continued to be of importance, but they ceased in and of themselves to constitute the signs of Muslim identity — giving way to observances which were more globally identifiable as “Muslim”.

The immediate consequence of this shift was to reinforce the leadership role of scholars in the Dyula community. Their personal behaviour was expected to set a standard, not only for the mory, but for the entire community. They were responsible for explaining to the entire community the kinds of behaviour that were proper or improper, forbidden, or enjoined. The guidelines which they set had to be acceptable, not only to Dyula Muslims but to Muslims from other communities as well. Before the Second World War, the public preaching of homilies was not a major activity of scholars, and was usually left to students. Now, karamogos - the younger ones at first — began to deliver sermons on a regular basis, as part of the ceremonials associated with Muslim calendar holidays as well as funerals. The sermons found ready and avid audiences, admittedly because they were a form of entertainment, but also, as one friend of mine explained, because Islam is a complex matter and it is the ordinary believer’s responsibility to make himself aware of the rules so that he may observe them properly.

In the short run, this new found “shari‘a-mindedness”, to use Hodgson’s (1974) term, provided Dyula scholars with more moral authority in the community than ever before. In the longer run, however, it provided a basis for challenging, rather than reinforcing, the legitimacy of scholars trained in the Suwarian tradition. Islam among the Dyula had formerly been predicated on the notion that different kinds of religious behaviour were appropriate for different categories of persons: tun tigi, mory, and karamogos. By the 1950s, a single standard of piety was held to apply, not only to all Dyula but effectively to all Muslims. Once the principle is established that all Muslims throughout the world ought to conform to the same norms of piety, perceived discrepancies appear as problematic. Indeed, if there is a universal standard of piety, the status of a local tradition of scholarship is effectively altered. Islamic knowledge has universal applications, and there ceases to be any a priori reason why a local pedigree, anchored in the Suwarian tradition, is necessarily preferable to any other.

Discrepancies are only a problem if they are perceived as such. However, the pax colonia, by favouring the freer movement of individuals from place to place, broadened the contact of Dyula with other Muslims (though the Dyula, as traders, were never isolated from such contacts) and increased the likelihood that individuals might perceive discrepancies of various kinds. In particular, it became easier to accomplish the hajj, though as long as the pilgrimage remained an overland journey, it remained long and hazardous. Few individuals from Korhogo actually undertook such a journey. It involved leaving one's family for years on end and finding odd jobs from place to place along the way in order to pay for each leg of the trip. Those who made the trip are remembered as having accomplished something remarkable, but not for returning with new ideas, new conceptions of Islam, or "being Muslim". However, the very fact that such journeys were actually made was itself significant. Al-Hajj ceased to be a title which was applied only to names on a list going back to the remote past, but became a contemporary reality. The journey to the Middle East and to the Hijaz — to the ultimate source of religious knowledge and authority — was no longer an ideal which for all intents and purposes was almost unrealisable, but a real possibility, even if beyond the means of most.

While the overland hajj did not have a direct intellectual impact on Islam among the Dyula of Korhogo in the first half of the twentieth century, it did for other West African Muslim communities with whom they were in touch. Towards the end of the Second World War, when the Dyula of Korhogo were in the process of

abandoning the lo societies, a number of Manding-speaking pilgrims returned from the hajj with a different set of ideas. After a prolonged sojourn in the Hijaz and the Arabic-speaking world, al-Hajj Tiekoro Kamagate returned to Bouake, the second largest town in the Ivory Coast, and began to preach against various practices associated with the Suwarian tradition. Roughly at the same time, a small cadre of young hajjis from Guinea and the Gambia — notably al-Hajj Kabine Kaba and al-Hajj Muhammad Fode — returned from several years of study at al-Azhar in Cairo, where they had chosen to remain as students on their return from the Hijaz. During their stay, they were exposed to the reformist ideas of Muhammad 'Abduh and his disciples. On their return, most members of this group ultimately chose to settle in Bamako, a more central and cosmopolitan location than their home communities. These individuals in Bouake and Bamako were disparagingly labelled "Wahhabis" by the French colonial authorities, who took a dim view of their activities.[88]

In both towns, they directly challenged the authority of established scholars. First of all, they criticised the formalism of the Sunni legal schools, and attacked the Sufi orders. Although Sufism is a relatively peripheral feature of Islam among the Dyula, most karamogos belong to the Qadiriyya or the Tijaniyya. The Hajjis denounced all forms of saint worship as illegitimately positing the existence of intermediaries between God and the ordinary believer. Like Sufism, saint worship is not a central feature of the Suwarian tradition, but the tombs of certain founders of scholarly lines are considered legitimate

objects of veneration. By challenging this notion, they called into question the legitimacy of such lines of scholarly authority, and, by implication, the intellectual pedigrees of Dyula scholars. They attacked all forms of magic as illegitimate: for example, the manufacture of written amulets — which constituted a part of the earnings of scholars. Last but not least, they denounced aspects of life-crisis and calendrical rituals, particularly the distribution of prestations — called saraka (“charitable donations”) by Suwarian scholars and their followers. These, the Wahhabis argued, did not constitute charity at all and so conferred no religious merit.

The Wahhabi criticism went considerably further than the challenge of nineteenth-century jihad movements. Adherents of jihad movements had appealed directly to the sources of knowledge in the Hijaz and the Middle East, without necessary recourse to the scholarly tradition of al-Hajj Salim Suware. The Wahhabis argued that such a direct appeal was not only possible but necessary, that the Suwarian tradition as a whole was corrupted and characterised

by bid‘a (“innovation”). It is not hard to understand why the French colonial authorities were openly hostile to the movement. They had, after long years of suspicion (Triaud 1974), come to terms with and accepted the Suwarian tradition. The Suwarian distinction between “religion” and “politics” encouraged Muslim scholars to come to a modus vivendi with the French, and even at times to proffer active declarations of support. Having reached the conclusion that established Muslim scholars were their allies, the French were alarmed about direct attacks on their legitimacy. Worst of all, the direct appeal to the Middle East as a source of knowledge and authority laid open the gates for the spread of pan-Islamic (and anti-French) nationalism, which, given the climate of emerging African nationalism at the time, was the last thing the French wanted to see. Indeed, some scholars have stressed the link between the Wahhabis and the Rassemblement Democratique Africain (RDA), the major nationalist party in West Africa.[89] However, although most Wahhabis were sympathisers, if not militants, of the RDA, both movements chose to distance themselves from one another. In Bamako, some of the wealthiest and most prominent Wahhabis chose to support the French (Amselle 1977); on the other hand, RDA support for the Wahhabis would have alienated Muslims loyal to the Suwarian tradition, many of whom also gravitated to the RDA. Despite French fears, the Wahhabiyya in West Africa was never a proto- or even a pro-nationalist movement in religious garb. The Wahhabi leadership took no official stance against the French but concentrated their attacks on local scholarly traditions.

This Wahhabi attack split Muslim communities throughout Ivory Coast and Mali. There were anti-Wahhabi riots in Bamako in 1957, and scuffles in Sikasso — just across the border from Korhogo. In communities with a large Wahhabi presence, including Bouake in Ivory Coast, control over the main mosque was a major issue, and the secession of the Wahhabis a frequent outcome. In general, the Wahhabis symbolically expressed their separation from the masses who continued to follow the lead of Suwarian scholars. The Wahhabis made a point of praying with their arms crossed instead of outstretched in the Maliki fashion. They also embarked on a programme of educational reform, establishing religious schools of their

own. Such schools were partly modelled on western forms of secular education, with separate classrooms and an emphasis on language instruction as opposed to rote memorisation. Such schools were intended as an alternative not only to traditional Qur'anic instruction but also to the rapidly expanding state-run secular school system which Wahhabis — and also many anti-Wahhabi Muslims — accused of undermining Islamic values.

Korhogo avoided the violent clashes between Wahhabis and their opponents that plagued other West African communities. None the less, the town was by no means isolated from the split between Wahhabis and Suwarian loyalties. The Wahhabis succeeded in making a few converts among the Dyula of Koko — notably among those living in Bouake — but also several who remained in Korhogo. In 1972–3, I was repeatedly witness to impassioned anti-Wahhabi arguments. Supporters of the Suwarian tradition of scholarship were on the defensive, eager to castigate their opponents as dangerous and ignorant innovators. Naturally, local scholars were all militantly anti-Wahhabi, as their own credentials were at stake. However, anti-Wahhabi sentiments were by no means limited to scholars; in this matter, they had the firm backing of the vast majority of Koko's Dyula community.

At stake was the relationship of Islam — of being Muslim — to community identity. The Suwarian tradition had not only tolerated but legitimised distinctions of status within the Dyula Muslim community. In the past, tun tigi and mory were allowed two different standards of religious behaviour. While this no longer held true, communal Muslim rituals gave expression, not only to ethnicity, to membership in neighbourhood or village communities, but also to clan ward membership, elder or junior status, and even to slave or free origins. The Wahhabis, on the other hand, denied the religious importance of such distinctions. For them, there were only "pure" Muslims — themselves — and ignorant Muslims. For this very reason, others perceived their behaviour as a form of exclusiveness. Implicitly or explicitly, the Wahhabis constituted a new kind of community, distinct from traditional bases. The Dyula stereotype of typical Wahhabis was of wealthy merchants, often relatively recent converts to Islam: Senufo for example, but also groups of traditional "caste" status like the Kooroko (Amselle 1977), or even slaves. In short, the Wahhabis were particularly successful in recruiting converts from among those groups and individuals who, during the initial years of the pax colonia, had moved into such new towns as Bouake or Bamako, converted to Islam, and wrested trade monopolies from groups such as the Dyula. They represented, in effect, the nouveaux riches among Manding-speaking Muslim traders. The danger remained, however, that they might also woo away the loyalties of successful merchants from communities such as Koko, who might be tempted to throw in their lot with wealthy colleagues of heterogeneous origins rather than acknowledge their obligations to less prosperous kin and neighbours.

Within the Suwarian tradition, intellectual pedigrees and hereditary statuses, while they were kept distinct, were nevertheless closely related. Access to knowledge was mediated by one's place in a locally anchored line of scholarly transmission; one's identity as a Muslim was mediated by one's hereditary membership of a local Muslim community. The Wahhabis denied the legitimacy of both of these criteria. Knowledge and moral authority came directly

from al-Azhar and the Hijaz; indeed, some Wahhabis have recently begun veiling their women, a practice unknown until now in the Korhogo region. True Muslims are to be known not from their birth, but rather from their behaviour which sets them apart from the mass of ignorant believers.

In 1972–3, although the Wahhabis made few converts in Koko, they attracted a number of sympathisers and seemed to be gaining ground in the community. When I returned some twelve years later, I found to my surprise that the issue had ceased to become controversial. To be sure, individuals were willing, in response to my questions, to list the multifarious errors into which the Wahhabis had fallen, but no one bothered to raise the subject on his own. The Wahhabi presence in the town as a whole was actually more conspicuous than before, if only because one could not help noticing the presence of women (even in small numbers) wearing the veil. However, among the Dyula of Koko, Wahhabi influence was on the decline. The example of one prominent Wahhabi — a prosperous trader living in Bouake — may demonstrate why. By 1984, he had acceded to the headship of a section of a large clan ward, and was now a prominent elder. As such, he was responsible for organising life-crisis rituals such as weddings and funerals, involving himself in the distribution of saraka prestations, and inviting scholars to preach sermons — the very kinds of activities that the Wahhabis vocally condemned. Though a Wahhabi, he was respected and well liked in Koko; the price he had to pay was public behaviour that flagrantly contradicted his Wahhabi ideas. Ultimately, the exclusiveness and dogmatic rigidity of the Wahhabis precluded their winning many converts in Koko. One could not simultaneously behave like a Wahhabi and like a prominent elder. Risking mild ridicule, one could privately hold Wahhabi beliefs and publicly behave like everyone else. Hard-line Wahhabis, uncompromising in their behaviour, were not tolerated in Koko. Such a stance would cut one off from one’s kin, and no one I knew from Koko was prepared to go to such lengths. On the other hand, the kind of compromises necessary to remain simultaneously a Wahhabi and an active member of the Koko Dyula community tended in the long run to discourage further conversions.

*** The third challenge: the new literacy

Paradoxically, whereas the Wahhabis themselves continued to be rejected by the Koko Dyula community, many of the ideas central to their conception of Islamic reform have become increasingly attractive. More than anything else, the spread of western-style secular education has been indirectly responsible, but western education came very late to Koko. The northern Ivory Coast — far removed from the capital and particularly impervious to missionary influence — had always lagged considerably behind the rest of the country. Only after the Second World War did any children from Koko attend western schools, and only because they were recruited by force. Such force quickly ceased to be necessary, as it became clear that western-educated youths had access to relatively lucrative salaried employment, but the north continued for a long time to lag far behind the Ivory Coast as a whole. As late as 1963, a survey of the Korhogo region indicated that only 17 per cent of

school-age children were enrolled in primary school (SEDES 1965: 1, 60). As a result, the first generation of educated males in Koko are only now in their fifties. They are old enough to be considered elders, though not senior elders, but a few are quite wealthy, and others relatively well-to-do, giving them a far greater influence than their age would normally merit. Partly as a result of their example and their influence, the number of educated — among women as well as men — has increased steadily, although the employment prospects for the educated have proportionally diminished at an even faster rate.

The spread of western education has altered Dyula perceptions of Arabic literacy. The Suwarian tradition of scholarship stressed rote learning. Texts, beginning with suras from the Qur'an, were memorised. The written word functioned partly as an aid to memory, as a means of assuring that texts were properly learned, and as a corrective to faulty recall. Even among karamogos, knowing a text meant in the first place knowing it by heart, as well as understanding the meaning of particular words and passages. I was constantly impressed by the facility with which scholars could reproduce Arabic texts from memory, rather than relying on the books in their libraries.[90] It must not be forgotten that the Suwarian tradition developed at a time when copying was the only means of procuring a text, when paper was a scarce and valuable commodity, and when libraries were highly perishable. Nowadays, when printed books in Arabic are readily available in the marketplace, human memory is not the only means of storing knowledge. Western education furnished another model for acquiring literacy. Of

course, western education also involved considerable amounts of rote learning, but children were from the very beginning introduced to the alphabet, to the meanings of specific words, and to basic principles of grammar. French, moreover, was also a spoken language in Korhogo, and could be used to communicate not only with French administrators but with Africans from other parts of the Ivory Coast. In the Suwarian tradition, the first use to which reading was put was the recitation of texts; in secular education, reading allowed the literate both to speak French and to understand various kinds of written texts at their disposal.

One of the first actions of the Wahhabis in Bamako had been to establish Arabic schools modelled to some extent on the western secular school system — not a surprising idea from individuals trained at al-Azhar and fluently literate in Arabic. The idea of a madrasa — a school which taught Arabic literacy in the same way as French — did not remain a Wahhabi monopoly. Such schools constituted an alternative to a purely secular education. The idea spread late to Korhogo, precisely because of Korhogo's lag in the field of western education, but in 1971 the first such school, the Ecole Franco-Arabe, was founded in town. The purpose of the school was to educate children, both in the standard, primary-school curriculum — French, mathematics, history, etc. — and in the Arabic language and Islam. Pupils were prepared for the primary-school certificate as a means of entry to modern employment, but in a way that would reinforce rather than conflict with religious values. However, such schools were not officially recognised by the government, and thus could not furnish an official transcript, required for admission to secondary school. Initially, this discouraged most parents from enrolling their children, but as employment prospects for secondary-school leavers became more bleak the benefits of such a combined

system of education seemed more attractive. The Ecole Franco-Arabe has not only survived, but has spawned a host of imitators in Korhogo. In 1973, it was common to pass groups of boys sitting outside, reciting texts from writing boards under the watchful eye of an adolescent, poised over their head with a rod ever ready to strike the pupil whose memory faltered. By 1984, two scholars from Koko had opened their own madrasas, complete with schoolrooms, blackboards, and French-as well as Arabic-language instructors, and the old system of Qur'anic education was virtually defunct in town.

The hope of such students and their parents is that they may pursue their education in the Arabic-speaking world. Various Arab countries offer scholarships to such students from time to time. The head of the Ecole Franco-Arabe keeps in constant touch with

various embassies in the capital, hoping each year to extract promises for a few reserved slots. In 1985, for instance, he was offered three scholarships from Egypt, and graduates from that year's class were urged to travel to the capital in order to take a competitive examination to determine who would go. In past years, I was told, Saudi Arabia, Kuwait, various Gulf emirates, and even Syria offered scholarships. (Admittedly, the Syrian case was a fiasco, since almost no parents were willing to send their children. This reluctance may have stemmed from the fact that Lebanese traders, who are either Christians or Shi'i Muslims, used to be known as "Syrians". As a result, African parents may have felt that "Syria" was hardly the place to procure a worthy Sunni Muslim education.) The winners of such scholarships might even obtain a university education in the Arab world, either in religion or in some secular subject. One could never be sure in any particular year which countries, if any, might offer scholarships, but as long as some pupils were chosen from time to time the hope remained.

I do not know what has happened to individuals from Korhogo who left for study in the Middle East, as this is such a recent development. However, other communities in the Ivory Coast — most notably Abidjan and Bouake — as well as in other African countries, began sending students rather earlier. Such students, if they do not return with a marketable technical skill, are prime candidates to teach in the new madrasas. They have first-hand experience of classroom teaching in Arabic, and they have achieved a considerable degree of fluency in spoken as well as written Arabic. Those who study in Saudi Arabia have a particular advantage, as the Saudi government has apparently been interested in underwriting some of the costs of such madrasas. According to the director of the Ecole Franco-Arabe, two Saudi teachers were originally sent to a school in Bouake, but they suffered from severe culture shock and had to be recalled. Since then, the Saudi government has preferred to pay the salaries of African-born teachers, trained in Saudi Arabia, as a form of assistance. One such teacher, a young man from Sierra Leone, was on the staff of the Ecole Franco-Arabe in 1985.

Aside from classroom teaching, individuals trained in the Arab world may choose to become full-fledged Islamic scholars. One such young man passed through Koko in 1985 and

delivered a sermon. Local Dyula, particularly those educated in French, were impressed. It was pointed out to me that he could pronounce Arabic in the way that Arabs do (the mass media have familiarised Dyula with “Arab” Arabic pronunciation), and not with the heavy

accent of locally trained scholars. He read texts fluently out loud (rather than reciting them from memory) and could comment readily on the meanings of different words, glossing them in Dyula with greater ease, in the opinion of his audience, than could local scholars.

Locally-trained and foreign-trained scholars thus possess two distinct styles of Arabic literacy. For Suwarian scholars, knowledge is first and foremost memorised knowledge of a relatively standardised corpus of texts; as one of them commented to me quite explicitly, “It’s what’s in my head, not in my library, that counts”. Foreign-trained scholars have a conception of knowledge that more closely resembles western notions. Knowledge consists in large measure in the ease with which information can be retrieved from written texts, as well as the fluency with which individuals can write and speak — as well as read and understand — Arabic. Literacy, in short, is a skill rather than a mastery of a relatively fixed body of texts. For western-educated Muslims, study in the Middle East is valued for the new style of Arabic literacy to which it gives direct access.

Fluency in Arabic, however, is not the only quality that attracts the western-educated to this new generation of Arab-trained scholars. Among students in the secular school system, there is a revival of interest in Islam, associated with the emergence of the Association des Eleves et Etudiants Musulmans de la Cote d’Ivoire (AEEMCI) — the Muslim Students’ Association of the Ivory Coast. The AEEMCI is officially recognised, and indeed partly funded, by the national government. It broadcasts a popular weekly programme on state-run television, and organises study sessions for students, as well as an annual national conference. Indeed, the conference was held in Korhogo in 1985, and was heavily attended by local residents as well as by delegates from around the country. Significantly, the association has links with the Arabic-speaking world and with Africans trained there. For example, the director of the Ecole Franco-Arabe in Korhogo is active in the local chapter, and the guest speakers chosen for its television show are frequently young scholars trained in the Middle East. The association and its Arab-trained scholars represent, like the Wahhabiyya, a “reformist” style of Islam. It preaches above all an Islamic morality — against drugs, alcohol, delinquency, prostitution, and premarital sex, stressing the importance of prayer, fasting, and the hajj. In itself, such moralising does not conflict with the Suwarian tradition of scholarship; local scholars preach on much the same issues. The difference lies in what the AEEMCI and the Arab-trained scholars choose to ignore and, in subtle ways, to devalidate — i.e. those

rituals, typical of local Islamic traditions, which are associated with life crises and Muslim calendar holidays.

This devalidation — one television show, for example, warned against overly ostentatious funerals — is consistent with the attitudes of a younger generation of western-educated Dyula Muslims. Unlike the first generation of school graduates, they are not assured of lucrative employment. Many of them can hope for a reasonably cosy living, but hardly for senior appointments in the foreseeable future. They are neither old enough nor wealthy enough to have much voice in local community affairs, but many of them are (or can aspire to be) prosperous enough to attract demands from their kin, particularly on such occasions as funerals and weddings. Their attitude towards such rituals can be summed up by a comment made privately to me by a young military technician during his grandmother's funeral: "Qapue le fric" ("It stinks of cash"). These young educated Muslims feel attached in important ways to their home communities, but in other respects wish to distance themselves, and feel unconcerned by many local goings-on. The Suwarian tradition, which places great emphasis on the importance and obligations (monetary and otherwise) of community membership, is associated in their minds with the heavy demands that the home community makes on them. The kind of Muslim identity advocated by the AEEMCI still permits them to express their solidarity with their home communities — Islam is after all a minority religion in the Ivory Coast — without making the same kind of demands on their resources.

Like the Wahhabiyya, the AEEMCI and the younger Arab-trained scholars thus constitute an ideological alternative to the local scholarly tradition. However, unlike the Wahhabis, the AEEMCI rigorously avoids confrontation. On the contrary, individuals active in the AEEMCI make every attempt to maintain cordial relations with locally-trained scholars: for example, inviting them to the graduation ceremonies at the Ecole Franco-Arabe. This policy is dictated in the first instance by the national government, which underwrites some of the association's expenses and without whose co-operation a weekly television show would be unthinkable. Indeed, the government is quite willing to foster the association's co-operation with conservative Muslim countries such as Saudi Arabia and Egypt, and in this way counteract the possible appeal of the "radical" ideology of states such as Libya or Iran. However, the association's conciliatory stance towards local scholars is not simply dictated by the state. Unlike the Wahhabiyya, the association does not reject Maliki "formalism" nor does it seek to distinguish itself doctrinally from the Suwarian scholars. The differences

are primarily those of style and emphasis. This allows the association to seek the support of local scholars for some of its goals, and gives scholars no legitimate grounds for denouncing its activities. Ordinary Muslims are thus not faced with choosing definitively between local scholars trained in the Suwarian tradition and Arab-trained scholars associated with the AEEMCI.

Individual preferences for one or the other group are not the subject of controversy and consequently do not split the Muslim community. Paradoxically, this peaceful co-existence of two scholarly styles is the greatest threat yet to the survival of the Suwarian tradition. More and more Muslims now own television; a novelty in Koko in 1973, they are now a common sight, even in relatively poor households, and villages in the north are beginning to receive electricity, which will permit villages to own their own sets. The younger Arab-trained

scholars’ access to television is a considerable boost to their prestige. Their new style of literacy in Arabic is intuitively perceived as superior — not only by Muslims with western secular education but also by those educated in the madrasas. The fact that the Arab-trained scholars distance themselves morally from the practice of ostentatious prestations during life-crisis rituals without denouncing such practices vocally attracts younger Muslims — particularly educated Muslims living away from their home communities, who privately resent the demands on their resources that such practices entail but do not wish to make a public stand against them that might alienate their older kinsmen.

In short, the spread of new forms of education — in both French and Arabic — have led to a certain disenchantment with the Suwarian tradition and its scholars. To possess an isnad that traces one’s intellectual pedigree directly back to al-Hajj Salim Suware is no longer a sine qua non for being acknowledged a Muslim scholar, since training in the Middle East now constitutes a universally accepted alternative. This is not to say that the Suwarian tradition is defunct. Karamogos are still being trained in the Suwarian tradition, although these are usually older men, villagers, or scions of locally established scholarly families. However, as more and more generations of educated Dyula Muslims accede to elderhood, it seems likely that the Suwarian tradition, once the only legitimate scholarly tradition in the region, will become more marginal.

*** Conclusion

The Hijaz, and, more generally, the Arabic-speaking world, have always constituted a source of origins for the Dyula: origins conceived both in terms of heredity (when different clans trace their

origins to the Hijaz during the Prophet’s lifetime) and in terms of the transmission of knowledge and moral authority (as expressed in isnads). Until the twentieth century, these origins were largely situated far away in space and time. Appeal to these origins was mediated by the presence of local scholarly lines of transmission of knowledge. This principle of mediation, and legitimacy which it conferred on local scholars, was always subject to possible challenge — to the notion that it was possible to acquire knowledge directly from its geographical source and thus to short-circuit the Suwarian pedigrees. Such challenges have occurred in three sets of circumstances: in the mid-nineteenth century, with the rise of militant jihad movements; after the Second World War, with the emergence of the Wahhabi movement; and in the past decade, in the form of an Islamic revival among educated Muslim youth. These instances were not accidental. Individuals did not simply happen to study in the Middle East and then attempt to bring back new ideas to their home communities. Until relatively recently, the trip itself was a formidable one, and even now is by no means easy. Study in the Middle East represented a quest for an alternative and superior source of knowledge, and consequently an implicit, if not explicit, calling into question of the local scholarly tradition.

These challenges all revolve around the issue of legitimacy — of the respective moral authority of a direct as opposed to a mediated appeal to the original sources of knowledge. The question of whether direct study in the Middle East does or does not supersede the authority of local lines of transmission is ultimately decided in the home community by individuals who for the most part are not themselves scholars. The fact that such issues have repeatedly split local communities, often violently, suggests that a great deal more is at stake than the reputations of individual scholars trained in one tradition or another. For this very reason, such challenges are not made lightly, and the circumstances in which they occur are highly significant. In each case, the underlying issue was the nature of the Muslim community itself. The jihad movements called into question the status of Muslim communities as minorities living in the midst of unbelievers. The Suwarian tradition held that different hereditary categories of persons might legitimately observe different religious practices. While it might be meritorious for anyone to emulate "shari'a-minded" standards of behaviour, only certain hereditary categories of individuals were under an obligation to do so. Unbelievers, provided they were not apostates and did not interfere with the religious practices of Muslims, were not necessarily to be fought, much less converted. In this way, Suwarian scholars legitimised patterns of relations between Muslim minorities and their

"pagan" neighbours; proponents of jihad, on the other hand, dictated that such relationships be jeopardised. Such movements advocated the creation of a new political and economic, as well as religious order. In communities such as Koko, where most individuals stood to benefit from the status quo, such ideas were not received with a great deal of enthusiasm.

By the end of the Second World War, the nature of the Muslim community in Korhogo had changed substantially. For reasons which lay largely outside the control of the Koko Dyula community, "Muslim" had ceased to be a hereditary category. Korhogo was full of new converts, both from within and outside the region. However, the Koko Dyula community continued to exist as such, and membership in it or in its constituent parts was continually expressed through rituals presided over by local scholars, who thereby implicitly asserted its legitimate existence in Muslim terms. Wahhabi leaders, invoking both their experience of the hajj and their training at al-Azhar, denied the legitimacy of both the Suwarian tradition, and, more crucially, of traditionally constituted communities within the larger community of Islam. They denied the salience of ethnic, local, slave, or caste origins in favour of the distinction between a truly Islamic community and the mass of believers who remained in ignorance, and mingled — in their eyes — Islamic and extra-Islamic practices. Dyula were effectively asked to choose between loyalty to their home community or to the new community of Wahhabi believers. Confronted with such a radical choice, the vast majority were unwilling to renounce their membership in their local communities, and Wahhabi influence was limited.

The growth of western secular education was again to alter the nature of the community and to provide the basis for yet another challenge to the authority of traditional religious leadership. A new social category is in the process of emerging, consisting of young

educated men (and increasingly women), often living outside their home communities, relatively well-to-do but hardly wealthy. These individuals are subjected to demands from their relatives, often in the context of life-crisis rituals which express both community membership and the status of individuals within it. While these demands are often resented, such persons are not financially or socially well enough off to wish to sever themselves from their kinfolk. Their situation differs from that of the Wahhabis in one crucial respect. Wahhabis are mainly merchants, involved in a sector largely dominated by Muslims, and so they can reasonably aspire to the constitution of a new, largely mercantile, Muslim community. The western-educated, on the other hand, find themselves in a category dominated by non-Muslims from other parts of the Ivory Coast, and so cannot express their social identity — i.e. class position — in religious terms. They can, however, look to younger Arab-trained scholars — individuals of their own age-category — for religious leadership.

These scholars and their followers are careful not to contest the authority of older local scholars or of the community rituals over which they preside, but they emphasise those aspects of Islam which stress the universal nature of the community of believers as opposed to those which implicitly validate traditional social categories. In this way, recourse to the Middle East as a direct source of knowledge and moral authority does not constitute a radical challenge to the Suwarian tradition of mediated knowledge, but rather poses itself as an alternative. However, for these very reasons, Suwarian scholars are left with no grounds for objection, nor can members of their home communities accuse their younger, educated kinsmen of wishing unequivocally to renege on their obligations.

Underlying these three sets of challenges to the Suwarian tradition of scholarship is a single issue: does Islam recognise, and by implication legitimise, hereditary social distinctions of any kind? The Suwarian tradition has always acknowledged the salience of hereditary categories — initially in the form of differences in religious practice, more recently in the modified recognition that it accords to community rituals. Within this tradition, isnads, while they are never assimilated to genealogies, perform an analogous function: scholars are attached to a local line of transmission of knowledge in the same way that ordinary believers are attached to local ethnic, political, and kin units. The appeal to direct, unmediated contact with the Hijaz — or, more generally, with the Arabic-speaking world — provides a model for a different kind of Muslim community that in principle ignores all hereditary distinctions and focuses exclusively on religious practice as the criterion for inclusion in the Muslim community. Study in the Middle East frees the aspirant scholar from dependence on the local religious elite in the same way that newly-constituted Muslim communities liberate their adherents from dependence on hereditary chiefs and clan elders. The Suwarian emphasis on the principle of heredity was attractive to the vast majority in the Korhogo region when the Dyula constituted the sole Muslim community — enjoying various economic, political, and social monopolies. With the erosion of these monopolies, however, control lay increasingly outside the community, and this emphasis on hereditary principles appealed less and less to those individuals who were relatively successful, but whose age or social origins relegated them to a subordinate position in traditional terms. Those who found new sources of wealth, power, or prestige were also attracted to sources of knowledge and moral authority which, in a sense, were also new (in that they lay outside the local community). Moreover, as they were geographically located at the wellsprings of religious

knowledge, these new sources of authority simultaneously enjoyed the aura of venerability — of a return to tradition rather than a departure from it.

In short, the spread of influence from the Middle East to West African Muslims like the Dyula has not simply been a question of diffusion, ofa radiating outwards from a “centre”. Rather, it has been part of a quest by groups and individuals for a set of religious principles which might call into question the importance of locally-anchored, hereditary, social distinctions, and might ultimately reevaluate the relationship between the local Muslim community and the global community of Muslims. Such quests have led individuals to seek knowledge outside their home communities, specifically in the Arabic-speaking world. Of equal importance is the fact that others in their communities have, for the same reasons, looked to these foreign-trained scholars for leadership.

[84] This paper is based on research carried out in and around the neighbourhood of Koko in the town of Korhogo, the largest in the northern Ivory Coast, in 1972–3 and in 1984–5. The second trip to the field was funded by both the National Endowment for the Humanities and the National Science Foundation. Except where othewise specified, observations in this paper about the “Dyula” refer specifically to those Dyula living in Koko quarter. For a detailed account of the Dyula of Koko, see Launay 1982.

[85] Sanneh (1979) argues for an earlier, thirteenth-century date for al-Hajj Salim Suware.

[86] The phrase was used by Ivor Wilks, to whom I am heavily indebted for his discussion of al-Hajj Salim and the Suwarian tradition.

[87] For the career of al-Hajj Mahmud Karantaw, see Levtzion (1968: 147–51) and Hiskett (1985: 168–70).

[88] For a history of the “Wahhabi” movement in West Africa, see Kaba 1974.

[89] For example, see Kaba (1974). Hiskett (1985: 290) goes so far as to label them “the religious wing of the Rassemblement Democratique Africain in West Africa”.

** Chapter Ten: Between Cairo and the Algerian Kabylia: the Rahmaniyya tariqa, 1715–1800

Julia A. Clancy-Smith

*** Introduction

The organised Sufism of the Islamic religious orders turuq (singular: tariqa) often had its origins in the travels of individuals driven by an intensely personal desire to acquire knowledge and to fulfil religious duties. The emergence of the Algerian Rahmaniyya order in the last quarter of the eighteenth century illustrates how the perigrinations of one man, in this case Muhammad ibn ‘Abd al-Rahman, contributed to the restructuring of socio-religious bonds in a particular Muslim community as well as the reaffirmation of ties between that community and the wider Islamic ecumene. Thus, a study of the activities of such an individual joins three strands in historiography: biography; world history; and the sociological and social historical study of mass movements aiming at religious renewal and reform. Together, these approaches can isolate the types of social transformations that constitute sea changes in any society, Muslim or otherwise.

At some time in the 1760s or 1770s, the kinds of popular expressions of piety that frequently signal the rise of a new saint or mystic began to occur in the Kabylia of north-eastern Algeria. Crowds gathered, miracles were proclaimed, and religious savants from other areas travelled to the Jurjura mountains to hear the preaching of a hajji and ‘alim (Muslim scholar) who had recently returned from the eastern Arab world. By 1777 Sufi zawiyas (religious lodges) had been created in the region, pilgrimages were organised, and local religious notables or disciples were authorised to

assume certain functions within the tariqa (Sa‘adallah 1981: 1, 514–16; al-Hifnawi 1982: 457–60). At the same time, a cult of saints had already coalesced around the figure of Sidi ‘Abd al-Rahman, whose intercession was sought by the faithful because of his baraka (supernatural blessing) and ability to work miracles (Rinn 1884). Several features of this cult and the emerging Sufi network were

viewed with alarm by political and religious authorities in the capital of the Turkish regency of Algiers, in particular the institution of the ziyara or pilgrimage. Even the saint’s death did not necessarily remove the perceived threat. Sidi ‘Abd al-Rahman’s burial and the popular ceremonials tied to his qubba (shrine) triggered more struggles to control the privileged places (and remains) associated with extraordinary beings.

The emerging cult in honour of Muhammad ibn ‘Abd al-Rahman and the elaboration of a new tariqa (brotherhood) were interrelated. Both of these were the product of earlier phases in Sidi ‘Abd al-Rahman’s life, before he became a saint or the founder of a new Maghribi Sufi order, and thus a menace to entrenched elites in his own country. Before examining the political nature of the ziyara in Turkish Algeria, a brief summary of Muhammad ibn ‘Abd al-Rahman’s life demonstrates one dimension of movement in Islamic societies — the connection between travel for pious purposes and socio-religious mobility. This in turn will help to explain how popular cults develop and why a conflict erupted over Sidi ‘Abd al-Rahman’s earthly remains in AD 1793–4.

Shaykh ‘Abd al-Rahman’s career was divided between the urbane, erudite world of the Cairene ‘ulama’, extensive missionary activity in dar al-Islam, and the Berber Kabylia with its tribal social structure. Through his efforts at tajdid (religious reform and renewal), and those of other like-minded Sufi scholars, the purified and the popular were recombined to produce what some scholars have called a neo-Sufi revival — “Sufism reformed on orthodox lines and interpreted in an activist sense” (Rahman 1979: 206; Voll 1982: 37–8). The Berber saint is thus representative of a whole class of energetic, itinerant Sufis and scholars whose activities in the late eighteenth and nineteenth centuries more closely linked distant parts of the Muslim world. This created the conditions of “critical mass” which led to populist movements of reform and renewal in Africa, the Middle East, and Asia (Voll 1980, 1982; Martin 1976).

Nothing in Shaykh ‘Abd al-Rahman’s family background predisposed him to a career that brought him within the inner circle of leading Egyptian ‘ulama’ and Sufis. In fact, the inhabitants of the Kabylia were not generally among those Maghribi groups that lingered for years in established communities in the Mashriq (Raymond 1959). Muhammad ibn ‘Abd al-Rahman’s missionary activities, his attainment of spiritual perfection, and his advanced education (acquired in Cairo) transformed a local talib (religious student or scholar) into a member of the Muslim elite. Thus, the matrix of the saint cult and

Sufi order associated with Sidi ‘Abd al-Rahman during his lifetime and after his death lay as much in Cairo and the Haramayn (the holy cities of Mecca and

Medina) — and elsewhere in dar al-Islam - as in his native Kabylia.

*** From the Maghrib to the Mashriq

Muhammad ibn ‘Abdal-Rahman al-Azhari Abu Qabrayn was born sometime between 1715 and 1729 into the Ait Isma‘il tribe of the Qashtula. This large confederacy was located at the margins of central government authority in the Kabylia, a mountainous area in the Algerian Tell that is heavily forested and densely populated. Its inhabitants are mainly Berbers or Arabised Berbers.

Independent, enterprising, and rebellious, the Kabyles maintained their traditional political and administrative institutions under Turkish rule. Before the French conquest, the region was composed of semi-autonomous village republics, estimated at some 1,400 settlements (Hanoteau and Letourneux 1872–3; Daumas 1853).

Sidi ‘Abd al-Rahman was from a locally prominent family claiming descent from the Prophet through Morocco’s Idrisi shurafa’ (descendants of the Prophet). His father, a scholar of somewhat modest stature, sent his son to a nearby zawiya, controlled by another saintly lineage, for religious instruction. Muhammad ibn ‘Abd al-Rahman then studied at the Great Mosque in Algiers prior to his departure for the Mashriq around 1739 or 1740 to perform the hajj and complete his education. After a period of time in the Hijaz, he settled in Egypt to acquire advanced learning at the Azhar mosque-university in Cairo, then the undisputed centre of Islamic learning. There the aspiring Berber scholar immersed himself in both jurisprudence and the mystical sciences (Rinn 1884; Giacobetti 1946).

Sidi ‘Abd al-Rahman’s sojourn in the east lasted almost three decades. During that time he studied with a number of leading Muslim scholars. The most important and influential was Muhammad ibn Salim al-Hifnawi (1689-1767/8), the leader of the Egyptian Khalwatiyya and rector of al-Azhar from 1758 until 1767 (Bannerth 1964: 1–74). Shaykh al-Hifnawi was a charismatic Sufi leader who, like many of his contemporaries, was not only in touch with developments throughout the Muslim world, but was also aware of the political inroads made by European powers into dar al-Islam. Muhammad ibn ‘Abd al-Rahman eventually became one of Hifnawi’s favoured students and closest associates (Martin 1972; de Jong 1978).

At some point, Shaykh al-Hifnawi ordered his Algerian disciple

to travel to Dar Fur in the eastern Sudan to instruct the ruler there. Muhammad ibn ‘Abd al-Rahman’s instructions were to teach Khalwatiyya doctrines in the Sudan and to “render service to humanity” (al-Niyal 1965: 337). He spent some six years in Dar Fur, where his efforts met with success, and may have subsequently travelled as far as India to preach. Some writers mention Turkey and the Hijaz as sites of his missionary activity as well (Andre 1956; Haas 1943). Upon his return to Egypt, Muhammad ibn ‘Abd al-Rahman was again instructed by Shaykh al-Hifnawi to embark upon more travels; this time he was to travel to the Maghrib to proselytise. Before the disciple left Cairo, al-Hifnawi conferred upon Muhammad ibn ‘Abd al-Rahman the khirqa, a ritual garment signifying the attainment of spiritual perfection

(al-Hifnawi 1982). It was with great reluctance that the Algerian Sufi and ‘alim left his master’s side; he was not to see him again.

The fact that al-Hifnawi ordered Muhammad ibn ‘Abd al-Rahman to propagate the Khalwatiyya doctrines in Algeria is significant. Although Algeria, unlike Dar Fur at the time, was decidedly not a frontier region of Islam, the coastal region of the province of Oran was still occupied by the Spanish, who only abandoned their presidio in 1792. Moreover, because Egypt and the Ottoman Regency of Algiers were alike in terms of the oppressed condition of their local populations under Turkish rule, al-Hifnawi may have regarded Algeria as suitable territory for neo-Sufi reforming activities (Julien 1964, 1970).

After an absence of nearly thirty years, the Berber shaykh and his family returned to the Jurjura at some time between AH 1177-83/AD 1763–70 (Rinn 1884; Delpech 1874). By the 1770s a school and zawiya were in existence among the Ait Isma‘il. From this outpost, Sidi ‘Abd al-Rahman taught, performed miracles, and initiated the Kabyles into the tariqa. Before long, it commanded a substantial following. News of his teachings and of the new ideas brought back from the Mashriq soon spread beyond the Jurjura, and attracted learned men from Algiers, Constantine, and Bougie to the Kabylia to hear him preach (al-Hifnawi 1982; Sa‘adallah 1981). The founder of the important Tijaniyya order was first initiated into the Khalwatiyya way by Sidi ‘Abd al-Rahman himself, perhaps during Ahmad al-Tijani’s journey from Fez to Mecca via northern Algeria in 1772–3 (Martin 1972: 303). Diplomas conferred by Sidi ‘Abd al-Rahman in the 1770s upon local religious notables in the region indicate that the brotherhood was in full expansion less than a decade after his return from the east. By the 1790s, the Khalwatiyya-Rahmaniyya zawiya in the Jurjura had evolved into a prestigious centre of learning (Delpech 1874).

While the tariqa was being established in the Kabylia, its Sufi membership grew steadily elsewhere in Algeria. Muhammad ibn ‘Abd al-Rahman’s reputation as a savant

and saint soon spread among urban notables in eastern Algeria. At some time in the late 1770s, Muhammad Bash Tarzi, a member of an eminent religious family from Constantine, travelled to the Jurjura zawiya to hear Shaykh ‘Abd al-Rahman’s words. Impressed by Bash Tarzi’s erudition and virtue, and perhaps by his family’s prominence, Sidi ‘Abd al-Rahman made him a Sufi muqaddam (representative), and enjoined him to proselytise in his native city to combat the “worldliness of its inhabitants” (Cherbonneau 1852: 517). Bash Tarzi’s affiliation with the Rahmaniyya worked to increase his clan’s fortunes and clientele, in addition to aiding greatly the expansion of the nascent tariqa in eastern Algeria and in north-western Tunisia. Particularly in the Biskra and Awras regions, the rise of local religious families to regional importance can be directly traced to their membership in the Rahmaniyya in this period (Clancy-Smith 1988: 41–3). Thus, the prestige of certain families became tied to Muhammad ibn ‘Abd al-Rahman’s own rising status; indeed, the two were intimately connected.

Sidi ‘Abd al-Rahman’s order encountered little, if any, opposition in Constantine, either from Maliki and Hanafi officials or from secular families of ancient notoriety. Perhaps these religious notables did not view the emerging Rahmaniyya tariqa as a threat precisely because they were so firmly embedded in the city’s social fabric (Vaysettes 1869; Mercier 1903; Nouschi 1955, 1961). However, Muhammad ibn ‘Abd al-Rahman’s activities aroused considerable enmity among some high-ranking ‘ulama’ and local maraboutic lineages in other parts of Algeria. The antipathy of saintly clans to Sidi ‘Abd al-Rahman’s reforms is revealing. The expanding Sufi order posed an unambiguous challenge to vested interests, particularly since it drew rural clients away from maraboutic leaders. This eroded their prestige, authority, and material resources, which were measured by popular followings and expressed in the idiom of the ziyara (Rinn 1884; Robin 1901). The annual or periodic ziyara to local saintly figures was both a visit which reaffirmed ties of religious patronage and an occasion for various sorts of exchanges (symbolic and material), since an offering was invariably made to the marabout for his intercession or blessing.

Early in the 1790s, Sidi ‘Abd al-Rahman began publicly to preach Khalwatiyya doctrines in Algiers, an activity that soon encountered opposition from some ‘ulama’. Although denounced as a heretic, he was found innocent and allowed to continue

preaching. In the aftermath, Shaykh ‘Abd al-Rahman established a Khalwatiyya-Rahmaniyya zawiya - not in the heart of Algiers but in the adjoining suburb of al-Hamma (Margoliouth 1924; Rinn 1884). He possibly chose this spot to temper any lingering hostility on the part of the city’s ‘ulama’ and to distance himself from the central government. As will be seen, however, the political centre would subsequently seek to appropriate the populist movement associated with the Berber saint to its own ends.

Roughly six months prior to his death, Sidi ‘Abd al-Rahman journeyed back to his native Kabylia to resolve the critical matter of his successor. The saint-founder did not select any of

his countrymen to succeed him. Instead, he named his closest disciple and spiritual son, Sidi al-Hajj ‘Ali ibn ‘Isa, originally from the Sus in Morocco, to lead the Rahmaniyya after AH 1208/AD 1793–4, the year most generally accepted for Sidi ‘Abd al-Rahman’s death. Sidi ‘Ali, who inherited his Sufi master’s baraka and the administration of the order’s hubus (waqf or religious endowment) properties, directed the zawiya in the Jurjura for some forty years without opposition (Rinn 1884; Depont and Coppolani 1897).

Towards the end of Sidi ‘Ali’s tenure in office, the French army landed in Algeria, causing the precipitous collapse of Turkish rule. During the two decades or more of military pacification following the 1830 invasion, membership in the Rahmaniyya appears to have increased. By the last decade of the nineteenth century, the tariqa commanded the largest popular following of any single Muslim brotherhood in Algeria and had important branches in Tunisia, the Sahara, and the Ottoman regency of Tripoli (Depont and Coppolani 1897).

*** Religious and political centres and peripheries

The issue of the “why” of Rahmaniyya growth is related to the issue of the “how” of its grass-roots mobilisation. The spiritual lessons composed by Sidi ‘Abd al-Rahman were evidently very popular. Moreover, his lessons distinguished the North African order from its eastern Khalwatiyya parent. Part of the Rahmaniyya’s ordinary ritual were the so-called “seven dreams”, inspired by the Prophet’s appearance to Muhammad ibn ‘Abd al-Rahman on seven different occasions. In the dialogue between the saint and the Prophet, the brotherhood’s orthodoxy is affirmed by Muhammad, and Shaykh ‘Abd al-Rahman’s virtues are enumerated for the edification of the faithful. The recitation of these seven dreams appears to have become part of popular lore and was recited during weekly Sufi meetings, rural religious festivals, and pilgrimages (Rinn 1884: 466–71).

Ritualised, collective visits to the shrines of saints and Sufis not only held forth the promise of supernatural favours, but were also important social events. They brought participants a large measure of emotional and psychological comfort, and, like the annual hajj to the Haramayn, local pilgrimages served commercial purposes since they frequently occurred within the context of mawsims or rural markets and fairs. Moreover, saints’ tombs and zawiyas were considered haram — sacred spaces whose inviolability was normally respected by Muslim rulers (Trumelet 1881, 1892; Dermenghem 1954). As such, they provided asylum for those fleeing tax collectors, political repression, or tribal vendettas. Later, under the colonial order, collective pilgrimages to saintly intercessors sometimes were the prelude to revolt or a forum for passive resistance to foreign rule, a fact recognised by French authorities who attempted to limit or even prohibit the ziyara in Algeria (Boyer 1977; Ageron 1968).

In Rahmaniyya doctrine, the founder-saint's blessings were not limited only to members of the order; a visit to his zawiya sufficed to channel grace to the supplicant (Giacobetti 1946). For this reason, the Rahmaniyya can be characterised as an inclusive organisation because adepts were permitted to belong to other turuq concurrently, and non-affiliates could receive spiritual rewards. This contrasts with the Tijaniyya which was more exclusive in terms of membership. This may have limited the Tijaniyya's appeal to specific social "classes" and prevented it from becoming the mass association that the Rahmaniyya did in eastern Algeria (Abun-Nasr 1965).

This popular appeal initially inspired official hostility to Muhammad ibn 'Abd al-Rahman towards the end of his life, and specific objection would have been made had he espoused Wahhabi doctrines. We know that the Kabyle scholar had spent time in the Hijaz during the middle of the eighteenth century and was a contemporary of Muhammad ibn 'Abd al-Wahhab, the puritanical Najdi reformer. However, according to Sa'adallah, there was little, if any, Wahhabi influence in Rahmaniyya doctrine (1981: 1, 516). Thus, other explanations must be sought for the elite's distrust of the new saint and Sufi from the Kabylia.

Muhammad ibn 'Abd al-Rahman was not only an outsider to Algiers by virtue of his village-maraboutie origins, but also as a Berber. He was thus regarded with disdain by the predominantly Arab and Arabo-Turkish 'ulama', who, out of social prejudice, did not mix with the Kabyles (Valensi 1969: 52). In addition, his

substantial popular following was undoubtedly viewed as a menace by both the religious and the political notables of the capital, whose interests were intimately intertwined. Moreover, in contrast to the situation in Constantine, the 'ulama' of Algiers occupied a much more precarious niche vis-a-vis secular political authorities. Above all, he probably antagonised the traditional men of religion, or part of them, by espousing "novel" ideas learned in Cairo — although the Egyptian Khalwatiyya's insistence upon the strict observance of the Qur'an and the sunna would scarcely seem heterodox (Rinn 1884). Perhaps working in his favour was the fact that the city's majlis and 'ulama' were divided into warring camps, with the Malikis pitted against the Hanafis (Boyer 1963). On the other hand, envenomed relations among religious factions may have provoked charges of heresy in the first place, with one group attempting to outmanoeuvre the other by making Sidi 'Abd al-Rahman's preachings into a cause celebre.

The role played by Turkish officials in the incident was characteristically equivocal. Some writers state that Shaykh 'Abd al-Rahman was cleared of the charges of heterodoxy after the authorities intervened on his behalf (Margoliouth 1924). News of the saint's internment in Algiers had sparked violent demonstrations in the Kabylia, and the government sought to appease the bellicose Kabyles who were upset by the persecution of their countryman. Other sources maintain that central authorities induced the majlis to level charges against Sidi 'Abd al-Rahman because his nascent movement threatened to group

around the semi-independent Qashtula tribal dissidents situated at the margins of state control (Rinn 1884; Doutte 1900). In all probability, both interpretations are accurate since these kinds of strategies were traditionally employed by the Turkish regime to rule Algeria (Boyer 1966). Here it can be posited that opposition by secular, ruling elites to Sidi ‘Abd al-Rahman was based more upon the saint cult associated with him rather than the establishment of a new Sufi tariqa. Yet the clumsy meddling from political authorities, seeking to dampen popular fervour attached to the Kabyle holy man, had the opposite effect.

What did not transpire in the period immediately after the saint’s release in Algiers was as significant as what actually occurred. Given Sidi ‘Abd al-Rahman’s following in both the capital and the Kabylia, one might have expected a showdown between the saint and his detractors. Nevertheless, Muhammad ibn ‘Abd al-Rahman chose not to capitalise upon his victory, either by forcing concessions from the authorities or by forming a party of militant resistance to Turkish rule. Instead, leaving the city for the countryside, he returned to the Jurjura mountains and his zawiya there.

*** The man with two tombs

Sidi ‘Abd al-Rahman’s death in 1793–4 placed him once more at the heart of a controversy which demonstrates the intersection between the social meaning of sainthood in the Maghribi context and the interests of the state. Public rituals, whether rural or urban, in veneration of holy persons might pose a threat to public order. Particularly worrisome were the festivals connected with the ziyara, or pilgrimage, which gave expression to collective beliefs about baraka, regarded as most potent in the vicinity of the saint’s tomb (Doutte 1900).

While all the European accounts and some of the Arabic versions mention the tug-of-war that erupted over Sidi ‘Abd al-Rahman’s corpse, there are two slightly different interpretations of the primary motives behind the theft. De Neveu and Trumelet portray the struggle, which ultimately resulted in two bodies and two tombs, as a purely devotional clash — two groups of spiritual clients desiring to possess what remained of the great Sufi and saint (de Neveu 1845; Trumelet 1892). However, among others, Depont and Coppolani (1897) and Rinn (1884) attribute a leading role to the central government, which seems plausible in the light of what happened earlier. Obviously, the two versions are not mutually exclusive; rather, the motives of secular authorities and tariqa brothers were different in inspiration.

Upon learning of Sidi ‘Abd al-Rahman’s death in the Jurjura, the authorities in Algiers became alarmed at the prospect of his burial in the Kabyle centre. This would attract large crowds of pilgrims to the shrine seeking divine favours through the saint’s intercession, something which could spark rebellion in an unruly population only imperfectly governed by

the political centre. Several authors suggest that Turkish officials, out of “diplomatic” concerns, encouraged Rahmaniyya adepts in Algiers to visit the Kabylia with the express purpose of repatriating the deceased to the capital by whatever means (Depont and Coppolani 1897; Gouvian and Gouvian 1920). Rinn (1884: 455) explicitly states that the government sought to end popular pilgrimages based in the Jurjura through the tactic of body-snatching.

Three days after Sidi ‘Abd al-Rahman’s death, his followers in Algiers learned of the event; particularly distressing was the fact that his tomb was a considerable distance from al-Hamma. Realising that neither pleas nor force would convince the Jurjura populations to relinquish the saintly remains of their spiritual mentor, the adepts in Algiers decided to employ a ruse. Three clandestine groups of Rahmaniyya brothers from Algiers went to

the region, determined to steal the recently entombed corpse of Sidi ‘Abd al-Rahman from its resting place. One group hid near the tomb; the other two sought to distract the Kabyles by joining with them in mourning the departed master. The plan succeeded. The mourners from Algiers kept the Kabyles sufficiently off-guard, while the others opened Sidi ‘Abd al-Rahman’s tomb, placed his corpse upon a mule and transported the stolen saintly goods under cover of darkness to the capital (de Neveu 1845).

[[d-f-dale-f-eickelman-james-piscatori-muslim-travel-11.jpg][Figure 10. 1 Shrines are also important among the Shi‘a. A Turkish postcard (c. 1980) depicting the carrying of a coffin to a shrine associated with the mosque in Kufa, southern Iraq. The main inscription in Arabic, which is translated into Turkish on the reverse side of the card, reads, “There is no youth equal to ‘Ali and no sword equal to Dhu al-Fiqar [‘Ali’s sword]”. (From the collection of Lois G. Beck.)]]

At daybreak, news that the stones and earth covering the burial site had been disturbed reached the assembled mourners; a bitter quarrel immediately erupted between the remaining Rahmaniyya brothers from Algiers and the Kabyles. As might be expected, the Kabyles suspected the outsiders and reproached them for their untoward behaviour. Seeking to exonerate themselves, the visitors

from Algiers suggested that they inspect Sidi ‘Abd al-Rahman’s tomb. The corpse was still in the qubba, much to the relief of the Kabyles and the astonishment of the others; a miracle was in the making (de Neveu 1845; al-Hifnawi 1982).

In the meantime, the third group had reached the capital, and soon arranged for Sidi ‘Abd al-Rahman’s burial in the al-Hamma zawiya. The struggle over the saint’s body was only resolved when each side proclaimed a miracle. The disputed corpse had been reduplicated, and both shrines — one in Algiers, the other in the Jurjura — contained the

baraka-producing remains. The news of the miracle spread rapidly throughout the Kabylia and elsewhere. The title Abu Qabrayn (“the man with two tombs”) was immediately bestowed upon Muhammad ibn ‘Abd al-Rahman by his followers, who from that day forth never invoked him without affixing the sobriquet to his name (Rinn 1884). The faithful explained this miracle by saying that the Almighty had reproduced the saint’s remains to prevent further conflict between brothers of the same tariqa (de Neveu 1845). Thus, a peculiar sort of miraculous movement was attributed to Sidi ‘Abd al-Rahman in order to maintain religious cohesion and avoid dissension. It was, moreover, in the political self-interest of the Kabyles to promote the legend because it raised one of their countrymen to “national” religious stature (Rinn 1884: 456).

Because of the remarkable duplication of the Berber saint’s body, the reigning dey, Hasan, had a magnificent mausoleum and a mosque built for Sidi ‘Abd al-Rahman at al-Hamma, with much pomp and circumstance. Not content with the erection of a building, surmounted by a long, pious inscription extolling Sidi ‘Abd al-Rahman’s virtues, Hasan Dey made arrangements for his own burial beside the wali (saint) (de Neveu 1845; Colin 1901). Like many of his Muslim (and Christian) counterparts, the dey was striving to bring the rural cult of a saint as well as the organisational matrix of a ramified Sufi order into the city. There he hoped to exercise more effective control over popular religious sensibilities, and obtain spiritual benefits from the company of the “very special dead” (Brown 1981: 69).

The memorial inscription of the al-Hamma shrine is revealing as well. The dedication recalled Muhammad ibn ‘Abd al-Rahman’s participation in “holy war, the great and small jihad”. The reader was told that whoever performed the ziyara to his shrine would find happiness in this world, and salvation in the next (Rinn 1884: 456). Thus, the individual supplicant’s redemption was assured by physical presence at the tomb-shrine, something requiring spatial movement, and by the saint’s spiritual odyssey between two

worlds, itself paralleled and confirmed by his body’s miraculous doubling.

Twice a year a great pilgrimage was held in veneration of Sidi ‘Abd al-Rahman, attracting the pious from all over Algeria and as far away as Morocco. The pilgrims reaffirmed their ties to the Rahmaniyya order as well as imploring the founder-saint for his blessings and intercessions in matters pertaining to this world and the next. While these pilgrimages took place at both of the saint’s tombs, the Jurjura shrine was popularly regarded as the more authentic of the two; its physical remoteness from Turkish authorities made it all the more attractive (Trumelet 1892).

The French conquest of Algeria in 1830 naturally increased the popularity of the mother zawiya in the Jurjura precisely because of its distance from the infidel’s

contaminating presence, which was much greater in the al-Hamma suburb of Algiers. Nevertheless, by the end of the nineteenth century, a large cemetery had grown up around the al-Hamma qubba; each Friday, women gathered there for weekly visits to the deceased, and enjoyed the shade offered by the garden of olive, pistachio, and Barbary fig trees (Trumelet 1892). The zawiya in the Jurjura was closed in 1857 and again in 1871 after anti-French insurrections inspired and led by Rahmaniyya shaykhs. Despite — or because of — colonial restrictions upon the pilgrimage, the two tombs of Sidi ‘Abd al-Rahman remained the object of veneration even as late as 1900. Mawsims, organised by Rahmaniyya centres in the south of Algeria, continued until the eve of independence (Rinn 1884; Depont and Coppolani 1897; Andre 1956; Despois 1957).

*** Conclusions

Clusters of relationships, sacred and profane, tend to converge around holy persons, whether living or dead. The cult of saints is socially constructed and reconstructed over time and space, resulting in new and multiple centres of piety and devotion — or “new saint maps” to borrow Alex Weingrod’s (Chapter 11 of this volume) expression. The same is true of the growth of new Sufi turuq. In the case of the Rahmaniyya, the system of rituals organised in veneration of Sidi ‘Abd al-Rahman engendered the Sufi order that emerged in late eighteenth-century Algeria during a time of troubles.

The tariqa established by Muhammad ibn ‘Abd al-Rahman brought social order and the promise of salvation to urban elites, city masses, and rural peoples in North Africa. Yet only after years spent in Cairo or in missionary activities far afield in dar al-Islam

did he acquire the knowledge, spiritual perfection, and individual piety that made him a cult figure by popular acclaim in his own land. The birth of the new saint and Sufi in Algeria was produced and confirmed by the movement of various groups, popular and learned, to his side after the 1760s or 1770s. The social recognition of his personal piety and learning, together with his earlier eastern travels, thus transformed him from a rustic scholar of unpretentious social origins to a leading member of the Muslim elite and Sufi establishment.

Islamic saints and mystics shared with their Christian counterparts the task of “joining heaven and earth” (Brown 1981: 1). Rather than belonging either to the “learned” tradition or to the “popular”, the Berber holy man combined both traditions in his work and teachings. The emergence of Sidi ‘Abd al-Rahman’s cult and the tariqa bearing his name demonstrate the complex interplay between particularistic expressions of belief in the village or tribe and the universal dimensions of Islam as a world religion.

Movement for Muhammad ibn ‘Abd al-Rahman, moreover, did not end with the grave. A conflict between state authorities and the very special dead resulted in a man with two tombs. Political elites have always and everywhere sought to appropriate religious symbols, rituals, and movements to their own ends. But the story of Sidi ‘Abd al-Rahman and the Rahmaniyya shows how the masses exercise a kind of popular sovereignty over public expressions of belief. The Turkish regime’s effort to organise a counter-cult around a stolen corpse and a state-sponsored tomb did not entirely succeed. The Kabyles fended off the attempt to expropriate their saint by collaborating in a miracle and by withholding their patronage of the al-Hamma shrine, located near the political centre.

Finally, in the work initiated by neo-Sufi reformers like Sidi ‘Abd al-Rahman, can we detect any evidence of an “important temporal shift in cultural understandings”, to use Eickelman’s phrase (1976: 20)? Affiliation with the expanding Rahmaniyya order meant that a somewhat parochial group of provincial holy men or saintly lineages became religious leaders, attracting followers from much wider areas by the end of the eighteenth century and the early decades of the nineteenth century. Their social and cultural horizons were no longer circumscribed by the modest outposts of Islam in the countryside that their ancestors had controlled for generations. This was true both in the Kabylia and elsewhere in Algeria and Tunisia, particularly in the pre-Sahara and Sahara.

The older ideology of maraboutism, which harked back to the Moroccan Sus or the mar aboutic diaspora of centuries earlier, was thus overlaid by another ideology. Cosmopolitan neo-Sufism, with its profound commitment to renewal and reform, especially through instruction, was oriented more towards the eastern Muslim world — above all, Cairo and Mecca and Medina. The Muslim East has always been important to the religious life of the Maghrib’s inhabitants. Nevertheless, the elaboration of brotherhoods, like the Rahmaniyya, suggests a vital shift in the relative cultural emphasis given to various sources of socio-spiritual legitimacy, although not a total break with the past.

This shift, I suggest, occurred at some time in the last quarter of the eighteenth century and appears to have continued unabated until approximately the middle of the nineteenth century, when the apparatus of French domination in northern Algeria was more or less firmly in place. Colonial authorities and institutions, whether wittingly or unwittingly, imposed forms of social and political control over Algeria’s Muslim population which gradually worked to reduce the extra-local nature of the Sufi turuq and the trans-regional relationships upon which those orders depended.

As far as eastern Algeria — the seat of Rahmaniyya influence — was concerned, a series of colonial laws was enacted from 1850 onwards. These laws restricted public gatherings and the movements of Muslims, particularly for purposes of religion. Many of these measures were the direct consequence of anti-French insurrections, often backed by Sufi or saintly leaders, and of France’s discovery of the existence of the Muslim turuq and their significance to Algerian society (Ageron 1968, 1979; Clancy-Smith 1989). The North

African orders depended to a large degree upon the free movement of leaders and clients to maintain followings, religious centres, revenues, and contacts with notables in other parts of the Maghrib and Mashriq. From roughly the middle of the nineteenth century, these intricate social and religious networks were increasingly prey to obstacles imposed by the colonial order. By the end of that century, many Sufi leaders and other members of the Algerian religious establishment had emigrated, been exiled, or were transformed into pillars of the regime, thus effectively ending the trajectory of the neo-Sufi movement of a century earlier. Other sorts of sea changes were in the making.

** Chapter Eleven: Saints and shrines, politics, and culture: a Morocco-Israel comparison

Alex Weingrod

Emigration and immigration movements provide rare opportunities to examine changes in the making. Social scientists can sometimes observe and trace the small, incremental acts that are the stuff from which larger-scale trends and processes subsequently grow. This chapter concentrates upon one such series of acts: the mass migration of Jews from North Africa to Israel, and particularly the ways in which new North African Jewish saints and shrines have been created in the fertile soil of the Holy Land. Compressed within a brief span of years, this latter process is packed with irony, volatility, and paradox. It is one of those occasional “ripe events” that invites a clearer glimpse into the dynamics of culture.

*** The problem: explaining the message

Each year since the early 1960s, late in the spring season, large crowds gather to take part in the pilgrimage to the grave of a new Jewish saint (or zaddik) — Rabbi Chayim Chouri. This pilgrimage takes place in the municipal cemetery of the city of

Beersheba, located in Israel’s southern (or Negev) region. By any reckoning, it is an extraordinary “multivocal” event, of which only the bare outline can be described here.

Rabbi Chouri was born in 1885 in the Tunisian island of Jerba, and was for many years the chief rabbi of Gabes. He was a popular figure within the relatively small Tunisian Jewish community: throughout a long and productive life he sponsored the publication of many religious texts, revived community activities, and, not least, successfully guided the Jews of this rural region when the Germans invaded Tunisia during the Second World War. Following the establishment of the state of Israel in 1948, and with the emigration of most of the Tunisian-Jewish community to Israel, Rabbi Chouri left for Israel in 1955, joining his wife and children

in the town of Beersheba. Soon thereafter, in 1957, he died at the age of 72. He was buried in a simple grave in a corner of the Beersheba cemetery.

As is customary among Jews, the following year on the anniversary of his death, members of the Chouri family and a small band of friends gathered beside his grave; several spoke briefly recollecting their rabbi, and the eldest son recited the memorial kaddish prayer. There was nothing unusual about this family ceremony; a year later it was repeated with a slightly larger number of participants. However, in the years following, this small family gathering grew enormously and became transformed into a great pilgrimage. By the early 1960s, hundreds and soon thousands of persons gathered at the cemetery on the occasion of Rabbi Chouri’s hillula, or memorial celebration. They crowded around the rabbi’s grave; lit candles and recited prayers; spread themselves across the cemetery with its graves and memorial stones in order to eat and drink the traditional meal, visit with friends, sing and dance — all in an outpouring of spontaneous gaiety and thundering power.

This tradition of a yearly pilgrimage has gained in popularity over the years, so that by the 1980s as many as 15–20,000 people gather annually to celebrate the event. Rabbi Chouri has become a saint, or zaddik, and many of the thousands who crowd around his grave pray for his intercession in matters relating to their health, good fortune, or problems of love and business. Tales are told and retold that celebrate the rabbi’s miraculous powers — how he appeared in dreams and offered direction and guidance to the ill, or how in time of war and peril he mysteriously presented himself to soldiers and guided them to safety. Within a brief span of approximately twenty years, Rabbi Chayim Chouri has been transformed from being a relatively obscure Tunisian rabbi to becoming the “saint of Beersheba”.

Although Rabbi Chouri was Tunisian, many of the celebrants in his hillula — as in many others — are Moroccan Jews who have, in effect, adopted the new zaddik as their own. In a recent article, Harvey Goldberg (1983: 68) makes the

point that, in Morocco, the Jewish zaddikim were a close parallel “to the elaborate culture of maraboutism characterizing Moroccan Islam”. Goldberg goes on to say (1983: 68) that the widespread belief in the powers of saints in fact served as a “conceptual bridge which allowed Jews and Muslims to communicate ... Jews and Muslims could enter into social exchange because of a shared set of notions and symbols defining the mundane and supernatural worlds”. The point is well-taken: one can see a kind of semiotic message of commonality in which the saints were markers in a discourse between the Moroccan Jewish minority and the Moroccan Muslim majority. But here lies the puzzle: if, in Morocco, the traditions of the zaddik and hillula were expressions of common understandings, then what meanings are being conveyed by new Jewish saints and memorial celebrations in Israel, where the majority of Jews are secular in orientation and disapproving of merriment and feasting in the cemetery and of the reputed magical powers of old rabbis and their graves? Why do tens of thousands of Moroccan and Tunisian Jews, now living in Israel, flock to these festive events?

*** Historical background: zaddikim in Morocco

In order to understand the growing popularity of these celebrations within their new and different Israeli setting we must first consider the historical context. Fortunately, recent studies of the Maghrib, referring both to Muslims and Jews and to the relationships between them, are in many respects comprehensive, authoritative, and detailed.[91] Comparatively small communities of Jews were for hundreds of years distributed throughout North Africa: Jews commonly resided in their own separate quarters (millah) in the principal cities and towns, and in the extensive rural areas they lived in their own small hamlets or were concentrated in a corner of Berber and Arab settlements (Eickelman 1983; Goldberg 1983; Shokeid 1985b). As was the case everywhere throughout the Muslim world, the Jews were defined as belonging to the political-legal category of dhimmi, or non-Muslim “protected people”. As dhimmis they were permitted to live alongside Muslims and to maintain their own internal community organisation. At the same time, they were required to pay special taxes to the reigning power, faced numerous social and economic restrictions, and were especially vulnerable to periodic plunder and physical attack (Chouraqui 1952; Lewis 1985). Although the overall fortunes of the Jews improved considerably under French rule, during the period of the

Protectorate they were in a separate (unequal) political and social category and typically maintained their distinctive minority identity (Abitbol 1986: 12–13). It should nevertheless be emphasised that, however inferior and peripheral they were to the society’s centre, the Jewish minority was tightly knit within the local social, economic, and political landscapes. For example, in rural regions (both Berber and Arab) the Jews supplied the tribesman as traders or artisans and were bound to them as their clients, and they also entered into wide-ranging economic and other exchanges with the town-based Arab elites and merchant families (Eickelman 1983; Geertz et al. 1979; Rosen 1984).

In addition, Arabs and Jews throughout the Maghrib also shared a broad array of common cultural features (Geertz et al. 1979; Goldberg 1983). To cite several examples from among many, they spoke the same language and dialects, seem to have shared sets of understandings regarding how society was to be organised, and drew upon similar beliefs and practices. This latter point is documented by the prevalence and importance for both Arabs and Jews of saints, their holy shrines, and the frequent pilgrimages made to them. Belief in the miraculous power of saints and holy men (walis), as well as the tradition of making a pilgrimage (ziyara) to their presumed grave or some other physical marker, has a wide distribution practically everywhere among Muslim populations throughout the Middle East and North Africa (Eickelman 1976; Goldziher 1971). Indeed, these practices are undoubtedly ancient and pre-Islamic, and they were shared by the numerous tribal or religiously-defined groups that spread throughout this large region. Within Islam, which itself originated from a composite of different religious orientations and world views, the belief in the miraculous power of saints is linked (although certainly not identical) with Sufism — that more mystical, emotional current of Muslim thought and practice.

As Islam evolved in the Maghrib, it developed a special emphasis upon saints and their powers, both spiritual and temporal. Maraboutism was, as Geertz and others have shown, a major motif and generating power within Moroccan Islam (Geertz 1968; Westermarck 1926). Eickelman's study of a Moroccan pilgrimage centre clearly summarises its main contours.

The most striking feature of North African Islam is the presence of marabouts ... They are persons, living or dead, to whom is attributed a special relation towards God which makes them particularly well-placed to serve as intermediaries with the supernatural and to communicate God's grace (baraka) to their clients. On the basis of this conception, marabouts in the past have played key religious, political and economic roles in North African society, particularly in Morocco ... A concrete indication of this is the proliferation of maraboutic shrines throughout the Maghreb ... In Morocco's rural areas, one rarely loses sight of the squat, whitewashed, and — in the case of the more popular ones — domed maraboutic shrines. In towns, more lavish shrines with green-tiled roofs are often found.

(Eickelman 1976: 71)

The themes underscored here — the marabout's baraka, his role as intermediary, the proliferation of shrines — are basic elements in the pattern. The shrines served as pilgrimage points, and the more important among them grew into pilgrimage centres: the believers came there often to pray for the saint's intercession in various problems of daily living, and during the yearly festival dedicated to the saint (musim) entire groups made the pilgrimage to the holy shrine, where they received the blessing of the living saint. A few of these pilgrimage centres grew into small towns, replete with a market, numerous shrines, a religious lodge (zawiya), and

various accommodations for pilgrims (Eickelman 1976). To be sure, the belief in saints was frequently attacked by the more orthodox Muslim theologians — yet, for many North African Muslims, maraboutism continued to be a vital part of their religious belief system.

There is, finally, another important dimension to maraboutism: in the Moroccan Muslim tradition baraka might be passed continuously along the generations, and saintly lineages played crucial political as well as ritual roles. In fact, the marabouts were frequently at the centre of local and regional political intrigue, and the long-lasting Moroccan pattern of periodic conflict between the central authorities, or makhzan, and the peripheral but powerful Berber tribes typically focused upon the ambitions of the living saints (Eickelman 1976; Gellner 1969, 1981).

Given this context of ideas and practices, it is not at all surprising that the traditions of saints (zaddik) and pilgrimages (hillula) were also extremely powerful among the Jewish minority. Deshen locates the genesis of the zaddik in the spiritual setting of the fifteenth- and sixteenth-century kabbalists of Safad and other Palestinian towns; among these Jewish mystics the tradition of prayer at the graves of rabbis and sages apparently began to take root (Deshen 1977). Grave sites became holy, powerful places — shrines — and the legendary Talmudic sages and rabbis who were buried there took the form of the zaddik — a pious, righteous man, and, ultimately, a saint. Moreover, a tradition developed of making a pilgrimage to the grave of the saint on the anniversary of his death. These periodic gatherings were known as hillulot, or memorial celebrations. Deshen describes the process in the following terms:

The hillulot originally focused upon the death of especially pious men, a death that was seen to be a mystical union between the soul of the deceased and the God-head ... According to popular thought the belief developed that the zaddik (saint) in

whose memory the celebration was held would intervene with God on behalf of his followers. Accordingly, persons who suffered from physical or mental illnesses might undertake a pilgrimage to the site of the zaddik in the hope and belief that their suffering would be lessened.

(Deshen 1977: 110–11)

The rabbinic authorities typically condemned and sought to discourage these enthusiastic outpourings, but they continued to have widespread popular support, even spreading from Palestine to the other small Jewish communities located throughout the Middle East and North Africa.

These traditions found a particularly sympathetic, not to say, luxuriant, environment in the Maghrib. What Ben-Ami, the Israeli folklorist who has done the major documentary work on zaddikim in Morocco, calls “saint veneration”, can be found throughout the North African Jewish communities (1984: 4). Indeed, his compendium of Moroccan Jewish zaddikim lists more than 600 saints and their shrines, including dozens that were equally claimed and revered by both Muslims and Jews. Virtually each Jewish community had its “own” zaddik, and in some places several local saints and shrines were worshipped. The zaddikim were typically deceased Moroccan rabbis, although, in other cases, the shrine and the zaddik were named after Palestinian rabbis who had visited North Africa and died there. In still other instances the shrine was named after a famed rabbi; the best known case is the Moroccan shrine of Rabbi Shimon bar Yochai, the Palestinian sage who was the reputed author of the Zohar — a book of mystical-religious teaching. These shrines were often located within the Jewish cemetery, although in some instances “they were not in the cemetery proper, but in a special spot, for example, a cave, at some distance from it” (Goldberg 1983: 65). A zaddik’s grave was usually covered by a simple roof in order “to distinguish it from other graves”, but these decorations were nowhere as elaborate as among the tombs of famed marabouts. The fact that these shrines were located within the Jewish cemetery is itself important: Goldberg (1983: 65) suggests that, symbolically at least, the Jews were in this way making a “claim to exercise rights in the territory on an equal basis with that of the Muslims”.

In addition, a number of the shrines became particularly famous, and these periodically attracted large crowds of pilgrims from various parts of the country; the best example is the grave of Rabbi David u’Moshe, located near Agouim in the High Atlas. Thus, as Ben-Ami (1984: 219) shows, not only were the graves of zaddikim

to be found in practically every Jewish community, there was also a kind of hierarchy of saints in which certain of them attained regional and almost national levels of importance.

In common with the Muslim marabout, the Jewish zaddik also possessed baraka, or grace and holy power. The zaddik was believed to be able to act as an intermediary with God — prayer at the shrine and vows (neder) might result in the positive outcome desired by the supplicant. Beyond prayers, the true mark of a zaddik was his ability to perform miracles — heal the sick, bring about good fortune in love and business, cure barrenness in women or provide male offspring, and, in addition, protect the weak exposed Jewish communities from their enemies. As Stillman (1982: 496) points out, however, there also were important differences between zaddik and marabout — for example, the miraculous acts attributed to the latter were often “of a more spectacular kind”. With notable exceptions, moreover, there were no families or lineages of Jewish zaddikim; on the contrary, the saint was typically recognised after his death, and his descendants were not necessarily involved with his shrine. In comparison, the marabouts seem to have played much more active and critical political roles than did the zaddikim.

Believers and persons in despair or need visited the zaddik’s grave throughout the year. However, the yearly hillula, performed on the anniversary of the saint’s death, typically brought together a large popular outpouring of persons. Based upon his Israeli informants’ recollections of hillulot in Morocco, Goldberg describes these celebrations in the following terms:

Descriptions of the local pilgrimages stressed how they involved the whole community. “Men, women and children” went, it was frequently said. It was commonly stated that everyone participated equally, “rich and poor alike”. The pilgrimage involved visiting the grave, lighting candles, and slaughtering animals (cattle or sheep), after which the meal would be served. The meal might take place in the cemetery, or just outside it. Sometimes, after the visit to the cemetery, the meal would be organized in the village proper. Descriptions of the eating patterns also stressed equality; everyone was given the same size or kind of portion ... Even allowing for an idealization of the equality that characterized these gatherings, it is unmistakable that they were Durkheimian high points in the celebration of communal life.

(Goldberg 1983: 67)

In keeping with their fundamentally different social and political positions, the green-tiled Muslim maraboutic shrines shone across the countryside, whereas the graves of the Jewish zaddikim were simpler and plain. Yet, as has been shown, there was also a broad range of overlap in belief and practice between the Muslim and Jewish traditions. Finally, even though the French colonial presence produced a series of rapid changes — migration to the central cities, the spread of French language and culture, growing secularisation — traditions of the zaddik and his hillula remained vibrant, so much so that new Jewish saints continued to emerge during the 1930s and 1940s (Ben-Ami 1984: 225).

*** The zaddik in the Israeli setting

While small numbers of North African Jews had immigrated to Israel prior to 1948, the establishment of Israel precipitated what ultimately became a virtual transfer of population. This immigration characteristically developed in several waves and ripples — a great initial movement to Israel in the period between 1948 and 1956, then a pause, followed by smaller waves later in the 1950s and mid-1960s. In the process, probably as many as 200,000 Jews left such ancient Jewish communities as Fez and Jerba, as well as such newer urban population centres as Casablanca and Tripoli, and began making a new life in Israel. Numerous studies have shown that their Israeli experience during the first decade or two was at best “bittersweet”, and often plainly bitter (Bar Yosef 1959: 249; Weingrod 1965: 39–40). In common with other immigrants then flocking to Israel, the North Africans needed to learn new occupations and skills, a new language and cultural styles, as well as adapt to

what was for many a new, centralised, western political-administrative system. Their high hopes and optimistic dreams were frequently dashed by the harsh realities of life in their new, relatively poor country. Moreover, many North African Jews found themselves dispatched by government planners to new development towns and agricultural villages (moshavim) then being built in the outlying northern and southern zones of Israel. This is an important point: new towns such as Beth Shean and Kiryat Shmonah in the north, or Dimona and Kiryat Gat in the south, were mainly composed of North African — primarily Moroccan — immigrants.

It was a difficult, frustrating experience, and the Moroccans in particular soon acquired a reputation for being hot-headed and aggressive; they were angered not only by the meagre conditions of daily life but also (and perhaps mainly) by the fact that the society's dominant social roles were monopolised by Ashkenazi Jews, the European-born (or bred) Israelis, and that they were expected to conform to the cultural norms espoused by this elite group (Marx 1976: 24; Shokeid 1985b: 281; Weingrod 1965: 40). The pressures for cultural assimilation and divesting one's self of previous beliefs and traditions were extremely powerful. The Moroccans also resented the discrimination and prejudice that were often levelled against them (a study of a mixed housing estate in the mid-1950s showed that the Moroccans were the least liked group). Not surprisingly, the two major incidents of rioting among Jews — the demonstrations in Wadi Salib in 1958 and the Israel Black Panther protests of the early 1970s — primarily involved Moroccan youngsters who protested violently against the dominant Jewish society and culture.

These were critical, formative features in the experience of many North African immigrants. But there were additional elements that became no less significant. Gradually, many of the immigrants mastered the new skills that had been thrust upon them: they became more fluent in Hebrew and at home in their new surroundings, and in common with other Israelis their living standard climbed steadily upwards. Although memories of prejudice remained close to the surface, the newer generation of youngsters appeared to be more confidently attached to their society. For example, together with other Israelis they fought in several wars, and, as further evidence of their newfound, upwardly-mobile status, a significant proportion married members of other Jewish ethnic groups (Peres 1985). Now entrenched in certain portions of the country, they have become the "veterans", instructing newer groups into the mysteries of life in Israel.

Partly as a consequence of these processes, during the 1970s a new ideology of ethnic pluralism began to typify the Israeli cultural outlook. The previous pressure to conform to European cultural norms lessened (or, putting it differently, the Ashkenazic hegemony weakened), while ethnic cultural differences were pronounced legitimate and even celebrated. The most vivid example of this shift was the late-1960s re-creation of the mimuna festival, a minor Moroccan Jewish festivity that has rapidly been elevated into an Israeli national holiday (Goldberg 1978: 75; Weingrod 1979: 63). The Israeli mimuna festival is fundamentally secular — its designers have successfully combined the old-country traditions of a springtime gathering that included family outings, feasting, and communal gaiety, with new Israeli political and cultural motifs. Significantly,

this Moroccan event became the model for other Jewish ethnic groups — the Kurds, Persians, Georgians, and others — who have subsequently organised their own Israeli ethnic festivals (Goldstein 1985).

Needless to say, ethnic politics began to thrive in this new cultural climate. The recent prominence of North African (mainly Moroccan) political leaders has been striking: several hold important positions at the national levels of government, and, what is more, the “North African caucus” in the Israeli Parliament includes more than twenty members (of a total of 120) who are themselves divided between the different, competing political parties. In these and other ways, Moroccan and Tunisian Jews have become markedly more integrated within Israeli society.

Following this brief review, we can now ask: What factors explain the emergence in Israel of new Jewish saints and pilgrimages? How can we account for the phenomenal growth of Rabbi Chouri’s hulula? What “message” is being sent by the thousands who gather yearly to celebrate in the Beersheba cemetery?

Several previous interpretations of the newfound popularity of the hillulot have been suggested. For example, Ben-Ami takes the view that it was to be expected that Moroccan Jews would adopt or create new saints in Israel. He believes that since the zaddikim were so vital an element in their religious traditions in Morocco, they were bound to revive these beliefs in the new, fertile climate of the Holy Land (Ben-Ami 1981: 302). He goes on to suggest that this process unfolded in three steps. At first, during the initial period of mass immigration (the early 1950s), Moroccan Jews sometimes made trips to several already established shrines, such as the Cave of the Prophet Elijah near Haifa. Later, in the second stage (the early 1960s), small celebrations in memory of famous North African saints were held in private homes and in synagogues. During the third stage (the mid-1960s), several new hillulot began to take “place on a national scale, and to this people came from all over the country” (Ben-Ami 1981: 303). To cite a different explanation, Deshen (1977: 120) has proposed a somewhat more complex set of reasons. Viewing these pilgrimages in the broader religious context of an overall trend towards secularisation, he argues that their popularity stems from the fact that “they are especially suited to the needs and problems of persons who have lost a large measure of their traditional culture and social moorings”. The revival of the hillulot is, according to this view, a response to a major cultural change or crisis in identity.

Both of these explanations have a certain logic and power. However, I want to propose a different avenue of analysis, one that focuses more squarely upon the political and cultural processes described previously.

The point can be stated as follows: Rabbi Chouri’s hillula and others like it are, among other things, statements of a new North

African, and particularly Moroccan, presence in Israel. This is a statement of the possibility of cultural difference or separation: in sharp contrast with the previous Moroccan context, the message sent by the new saints and their pilgrimages is the legitimacy in Israel of a separate, different, cultural and political organisation. Indeed, if, as Goldberg suggests in the passage cited earlier, the Jewish cemetery and its shrines were a symbolic statement of the Jews' equal claim to legitimacy in Morocco, then how much more emphatically (and successfully) this is stated by Moroccan Jewish saints buried in Israeli cemeteries. The message that emanates from the municipal cemetery in Beersheba is not "how much we are like other Israelis", but rather, "since we are Israelis we can also celebrate publicly according to our own particular traditions".

What attracts thousands of Moroccan and Tunisian Israelis to this hillula is that it is an occasion for them to celebrate publicly on their own terms: this is "their holiday", commemorating "their Rabbi", and it is performed in a grand style according to "their own traditions". This is a powerful motivation: it is now possible for them, Israelis all, to assemble and celebrate the anniversary of the death of a Tunisian zaddik. They gather together normally and proudly with no hint of crisis in their social or cultural identity of belonging. This is a true sea change, although it is the result of a gradual process. As was emphasised previously, North African Jews have had a series of difficult experiences as immigrants in Israel. Looking back, they can point to the harsh, trying years when they were declasse, thrust into outlying places where they were somehow expected to manage. At the same time, however, they can also proudly claim to have become adjusted and even to have mastered their new Israeli environment, and — at least for some — to have climbed upward on the socio-political and economic ladder.

The movement from a kind of self-hate to a newer "ethnic pride" is an important facet of this process. Indeed, it helps to explain why, following Ben-Ami, it was only in recent years that the hillulot were publicly celebrated on a massive scale. The Israeli emphasis upon "immigrant absorption" and against separate cultural organisation had previously stigmatised ethnic cultural as well as political organisation, and it was only later — as in the case of Rabbi Chouri — that these and other festivities attracted ever-widening audiences. This is the "other side" to social mobility and heightened social integration: as these immigrants became more accustomed to life in Israel and more adept at moving upwards in the society, they also gained the confidence and strength enabling them to organise their own public festivals. The emergence of ethnic

celebrations is therefore not a sign of the failure to assimilate, but the reverse: large public events such as Rabbi Chouri's hillula are legitimate because the participants have become more thoroughly absorbed within their new milieu.

*** Saints, politics, and culture in contemporary Israel

Attention has thus far been given to new saints and pilgrimages as a focus for ethnic group revival and mobilisation. There is, of course, an array of other topics arising from the emergence of new zaddikim in Israel. Some of these issues can best be understood by continuing the Morocco-Israel comparison, whereas others are better analysed within the particular contexts of contemporary Israeli society. What they have in common, as we shall soon see, is a certain paradoxical, unexpected quality.

Before turning directly to these topics, however, it is necessary to get a better sense of the scope of the process itself. Rabbi Chouri is not, of course, an isolated case: a new “saint map” replete with yearly festivities is rapidly being engraved upon the landscape. During the past twenty or so years pilgrimages have been initiated or greatly enlarged to a series of old and new holy shrines (Ben-Ami 1981: 301–2). These older shrines include the giant pilgrimage to the grave of Rabbi Shimon bar Yochai, located near Safad, that yearly draws upwards of 150,000 participants; or the hillula of Honi Hameagel, a Talmudic sage whose grave near the northern town of Hatzor has also become a local pilgrimage site. Two new shrines are especially fascinating. Within a Safad neighbourhood, a Moroccan immigrant developed a new shrine devoted to the famous Moroccan zaddik, Rabbi David u’Moshe: in this case the zaddik is believed to have been mysteriously transported from the Moroccan Atlas to his new shrine in northern Israel, where thousands of believers now light candles and pray for the saint’s intervention in matters of health or good fortune (Bilu 1987).

Another case of a new saint is that of Rabbi Israel Abouhatzeira, or, as he is popularly known, the Baba Sali. In certain respects this zaddik is similar to Rabbi Chouri. Like Rabbi Chouri, he too was a contemporary rabbi (in this case Moroccan) who has become a zaddik. Rabbi Abouhatzeira was a member of the most distinguished Moroccan Jewish rabbinnic family and famed for his erudition and healing powers; his home and yeshiva, or religious seminary, near the southern town of Netivoth, drew crowds of believers who came to him for his counsel and blessing. Indeed, the Baba Sali had already become a zaddik during his lifetime, and it was therefore not surprising that following his death (at the age of

94) his grave immediately became a holy shrine. He is undoubtedly the most famous of the new zaddikim, and his photograph — icon-like — can now be seen hanging in countless homes and shops spread throughout Israel.

Needless to say, the sites on this new “saint map” are primarily frequented by North African Jews: the periodic hillulot draw large crowds of older and younger Moroccans and Tunisians who expend considerable time and substantial resources in taking part in these festive occasions. To be sure, the giant celebration to the grave of Bar Yochai also includes thousands of Ashkenazic religious zealots, and the Baba Sali also attracted

followers from within this group. None the less, North African Jews have given the major impetus to this saintly revival.

One of the striking features of both the new and older shrines is that they are situated in outlying marginal zones: while the majority of Israel's population resides in three large central urban areas — in and around Tel Aviv, Jerusalem, and Haifa — saints and pilgrimages are centred in peripheral small towns in the north and south, places like Hatzor in the Galilee or Netivoth in the Negev.[92] How can this be explained?

Several interpretations may be suggested. First, these peripheral areas are precisely the places to which large numbers of North African immigrants were directed when they first arrived in Israel, and, as was pointed out previously, these zones continue to have a large Moroccan-Israeli population. This somewhat skewed population concentration is a major reason why the new zaddikim and their shrines have developed there: the new saints, all of whom are of North African provenance, thrive close-by to their followers and believers. Second, as suggested in a recent article (Ben-Ari and Bilu, 1987), the new shrines are an expression of the immigrants' growing ties and attachments to their new locale. Ben-Ari and Bilu (like Ben-Ami) also emphasise the fact that new zaddikim are a recent trend, and argue that this is a part of the process through which "the residents' sense of belonging to the locality acquires a wider meaning".

A third reason may also be suggested. For a variety of reasons saints typically are to be found in more remote, peripheral areas. This was certainly the Moroccan pattern (true for both Moroccan Muslims and Jews), and it also extends to saints' shrines and pilgrimages in other civilisations (Brown 1981: 43; Gellner 1981). If anything, saints seem to thrive away from the more refined, cosmopolitan, urban centres. It is not that urban residents are less prone to search for saintly inspiration or do not have a need for saintly intermediaries — an unlikely hypothesis — but rather that urban-based religious theologians tend to oppose or denigrate the worship of saints. To a considerable degree this has been the case in Israel, where the religious authorities have tended to oppose or frown upon the "discovery" of new zaddikim.[93] This helps to explain why, for example, new zaddikim have thus far not emerged among the substantial North African populations that reside in or around Jerusalem and Tel Aviv. The greater likelihood is for shrines to develop in rural areas, and for town and city residents to undertake pilgrimages to these distant locales.

Beyond their physical location, the process of new saint formation is closely tied to a number of recent Israeli political and cultural currents. If, as was pointed out previously, there were no families or lineages of "living zaddikim" among Jews in Morocco, this may be changing in the new Israeli environment. There appears to be emerging, to some extent at least, a Moroccan — Israeli version of "maraboutism".

This development has to do with “religion” and “politics”, and the curious ways in which they sometimes intersect in contemporary Israel. Two of the famed new zaddikim - Rabbi Chouri and the Baba Sali — can serve as cases in point. To begin with, family members and close kin of both of these saints have lately plunged into politics: one of Rabbi Chouri’s grandsons is a rambunctious member of the Beersheba City Council, and one of the zaddik’s sons was mentioned as a candidate for election to the Israeli Parliament (or Knesset) on a new, mainly North African religious political party list. Similarly, the Baba Sali’s son and erstwhile “spiritual heir”, himself a controversial personality, has also become involved in local and national politics, and one of his cousins is Knesset member. Thus it would appear that the saintly mantle and its baraka are not far removed from political party as well as personal ambition and power.

There has also been a rapid expansion of activities around both of these new zaddikim. Several years ago an already existing small Beersheba yeshiva was named after Rabbi Chouri: located in a modest building, the yeshiva has become the centre of activities designed to spread the Rabbi’s fame. A small core of devoted followers (including one of the Rabbi’s sons) take the leading roles in these endeavours. Like other religious seminaries, the Chouri yeshiva receives government financial support, and private supporters and believers have also contributed to its activities. Thus, in effect, the new zaddik’s charisma and following has produced a linkage with a state-sponsored religious institution that, as a consequence, has resources placed at its disposal.

A similar process has been under way at Netivoth, the “home”

of the Baba Sali, but there the institution-building is on a more lavish scale and the resources are considerable. The saint’s tomb was elaborately built and decorated in a style reminiscent of the Maghrib: this large, domed shrine stands by itself, separated from and dominating the town cemetery. A continual stream of pilgrims go there throughout the year, and during the saint’s hillula the crowds are enormous — often numbering well over 50,000 participants. In addition, a large yeshiva - named after the zaddik - is located in the town, and it serves as the focus for the various activities that celebrate the saint’s memory and miraculous works. In fact, the local town council has considered changing the town’s name from “Netivoth” to “Netivoth Israel”, in orer to connect itself even more closely with the saint, Rabbi Israel Abouhatzeira. This small town — a failure as an Israeli development town — may yet prosper as the centre for the ever-expanding activities being promoted in the name of the Baba Sali. It is, indeed, becoming a pilgrimage centre in which the zaddik’s son plays the role of the “living saint”.

There is, finally, still another way in which the new zaddikim have become linked with Israeli politics and culture. The recent attention given to saints and pilgrimages can also be seen as part of a deeper political and cultural trend. To be more specific, what

Ben-Ami (1984) calls “saint veneration” is related to broader movements in which significant minorities within Israeli society have become more fundamentalist in outlook, nationalist in ideology, and supportive of right-wing political parties (Cohen 1983). These trends have undoubtedly become more pronounced during the past two decades; indeed, it is fair to state that within the same or overlapping populations a certain mystical religious orientation seems to have grown together with, or close to, what can properly be labelled as right-wing political nationalism. This is a distinctly frothy, unstable mix, and at certain moments it has swung in curious, unexpected directions. Zaddikim and hillulot have at times been directly interwoven with these currents; for example, some of the pilgrimages provide occasions in which rabbinic figures and right-of-centre political leaders appear together before crowds of believers, and during election campaigns the image of a holy shrine may be flashed upon the television screen. Beyond these particular occasions, the growing popularity of these celebrations has encouraged a certain nationalist — religious sensibility that has grown more pervasive and influential.

*** Comparisons and conclusions

The short-spanned, volatile bursts of energy that have been described in this chapter point to a number of broader conclusions. The lines of analysis have flowed mainly around belief and ideology, on the one hand, and power and practice, on the other. The theoretical problem is to understand how they are connected — in other words, how culture and politics become intertwined within the particular realities of migration and immigration.

These topics can be seen comparatively: certainly, the examples are reduced to miniature, but they help to illustrate the issues. Of relevance here is Abner Cohen’s analysis of the origins and explosive growth of a West Indian carnival in Notting Hill in London. The context and actors studied — West Indian immigrants seeking to find their way in contemporary London — have a great many parallels with Moroccan immigrants in Israel and the emergence of new saints and pilgrimages. Cohen shows how, in a brief span of years, a local interest in organising an “English country fayre” became transformed into a giant Trinidadian-styled carnival replete with steel bands, calypso tunes, and street performances — all set within a working-class section of contemporary London (Cohen 1980, 1982). Political energies were set loose in this event, and so too was creative artistry in organisation, music, and pageantry; at one level, the carnival, like the hillula, is a prime example of an ethnic renewal ceremony as thousands of West Indians parade through London streets.

The second example is drawn from the Muslim world — or to be more specific, from Muslims presently engaged in building new lives in a number of western European countries. Turkish Gastarbeiter in Germany and Belgium, or Moroccans in France and Holland, are the obvious parallels. Away from their homes “temporarily” (meaning for lengthy, extended periods of time) in what has fast become a Muslim diaspora, these new immigrant minorities are also fashioning novel cultural designs. Ruth Mandel’s chapter in this volume suggests

some of the cultural-cum-political dimensions of this process. Her depiction of the changes taking place among the Turkish Alevis is particularly apt. A minority group within Sunni Turkey, the Alevis seem to have taken a prominent role within some of the Gastarbeiter communities — where, among other things, their distinctive religious rituals (ayin-i cem) take on new substance as rival political factions contest over group leadership. Thus, in common with the Beersheba cemetery and London's Notting Hill, new cultural performances designed by Turks in Berlin or Berne also become formats for rapid cultural creativity.

Finally, there is a more general conclusion to be drawn. Abner Cohen's previously cited studies present a useful starting point. Cohen's main theoretical conclusion is that "politics" (as represented in his research by ambitious leaders or in social class conflicts) and "culture" (expressed by steel bands and a syncretic religion) are not properly reducible to one another: each has a different internal dynamic, follows along different tracks, and consequently may merge or interact with the other in ways that are unpredictable and often paradoxical. The processes traced in this study underscore and strengthen this conclusion. For example, the spontaneous, essentially naive fashion in which new saints and shrines become popularised is only subsequently understood to be linked with the emergence of radical political ideologies. To cite another example, a saintly presence leads, with snowball-like speed, to the development of a religious seminary, schools, and streams of pilgrims and other resources — all of which suggests an Israeli version of a Moroccan shrine-centre. There is, in brief, a kind of "ricochet effect" in which action in one corner of the system will have implications elsewhere.

What this also means is that complex relationships exist between culture and politics which, at least in retrospect, appear to be systematic. This conclusion may not be surprising, but it is intriguing none the less. When they do intersect — while the "ricocheting" takes place — political and cultural currents build a nurturant, supportive set of beliefs and understandings. Hence, once religious nationalist ideologies emerge, they dovetail with belief in the efficacy of saintly powers. This statement is, of course, a version of Weberian theories concerning the relationship between politics and religion, or elites and ideologies. That theory continues to provide useful perspectives upon these endlessly engaging topics.

[91] During the last two decades in particular, North Africa has been a focus for a series of excellent anthropological studies. In regard to relationships between Muslims and Jews, see in particular Abitbol (1986); Rosen (1972); Geertz et al. (1979); and Udovitch and Valensi (1984).

[92] An exception is the shrine and hillula celebrated in memory of Bu-Shaif, a Libyan Jewish female saint. The synagogue built in her memory, which is the site of the pilgrimage, is located in a village close to the large Tel Aviv urban area. The

hillula attracts crowds of several thousand persons, most of whom apparently are Libyan Jews.

[93] The issues are complex: the official rabbinate mainly seems to ignore the shrines and hillulot, although some of the North African rabbis in Israel are present on these occasions. The exception is the Baba Sali, where religious dignitaries join other “celebrities” in a public demonstration of participation.

** Chapter Twelve: Ziyaret: Gender, movement, and exchange in a Turkish community

Nancy Tapper

This chapter describes the beliefs and practices associated with the notion of ziyaret (Arabic, ziyara) in a single Muslim community, that of Egirdir, a provincial town in south-western Turkey. My account is thus tied to a specific ethnographic context. I have incorporated a number of Turkish terms in my text, not only because I feel that readers should consider how key terms have been translated, but also because these terms are in fact widely known and used in the Muslim Middle East and thus can be used to locate my argument cross-culturally. I have also limited my investigation in a second way. The semantic range of the notion of ziyaret is considerable and raises many interesting problems. However, I have chosen to address specifically only two related questions of comparative interest: Why are Muslim women, more often than Muslim men, concerned with the shrine visits known as ziyaret? Why are such women’s ziyaret activities often disparaged by men?

In Egirdir, and indeed elsewhere in the Muslim Middle East, ziyaret forms a single category denoting shrines, pilgrimages to shrines, and formal visits in a variety of social contexts. However, I suggest that an understanding of the notion of ziyaret depends on several related assumptions.

First, a study of categories of movement, such as ziyaret, should be concerned not just with the form of movement per se, but with the content of the exchanges and communication which that movement facilitates. Thus, how does the movement associated with ziyaret organise interactions both between individuals and between human beings and supernatural entities — greeting rituals, prayers, vows and sacrifices whose returns are material, and spiritual blessings? I suggest that such interactions are structured by the pervasive notion of respect (saygi; hurmet), a key to understanding the meaning of ziyaret in Turkish society and probably elsewhere. In the broadest sense, then, ziyaret is voluntary movement for the purpose of paying respect, implicitly to a person or shrine whose authority is thereby acknowledged. Legitimate authority for Muslims is primarily religious, or religiously sanctioned, hence the pervasive religious connotation of ziyaret.

Second, I consider that an understanding of the constructions of practised Islam, which include notions such as ziyaret, depends upon understanding local standards of orthodoxy and heterodoxy as they are defined and sanctioned by the religious and political establishments. For instance, in the past, the town of Egirdir and its environment were felt to be permeated with a sanctity that derived from the shrines (ziyaret) of the many saints (evliya) who were buried there. Many of these sites were destroyed in the zealous secular Republicanism of the 1930s and 1940s and contemporary Turkish Islam continues to devalue the role of saints and to become increasingly mosque-centred. Thus in Egirdir today, the status of the notion of ziyaret as applied to saints and shrines is ambiguous: the religious and political establishment, and indeed virtually all men, scorn shrine visits and consider that faith in the power of the saints is unnecessary and inappropriate.

Third, I suggest that ziyaret also derives meaning from its contrasting relations with other categories of movement (hareket) or journey (yolculuk, seyahat, sefer). Some of these have specifically religious connotations, such as the prescribed hajj (Turkish, hac) or pilgrimage to Mecca; others, such as picnics (piknik) with their paradisical associations, are ambiguous; yet other categories of movement have no explicit religious connotations but are intimately associated with gender constructs, as is the case of the non-purposive movement associated with going for a stroll (gezi), a male prerogative par excellence.

Finally, in academic studies of Muslim societies, men’s ideals, beliefs, and actions have usually been privileged above those of women; typically, this bias confirms and reinforces the bias against women that is intrinsic to Muslim cultural traditions themselves. If questions of gender are to be investigated, it is essential to analyse a notion such as ziyaret that has a prominent place in practised Islam, and to consider implicit behaviours that are associated with it. Thus, in this chapter, I examine the relation between movement, gender, and the indigenous notion of ziyaret in terms of two analytic categories. One concerns those occasions when women and men move outside the home together, and the other when women without men leave the domestic setting. As we shall see, gender differences are relatively unmarked and women and men participate more or less equally in those occasions associated with the first category, whereas the women’s activities of the second category differentiate women from men and reinforce constructions of female inferiority.

*** Egirdir[94]

Egirdir is a market and administrative centre for a region of some forty villages. The town itself has a population of about 9,000 — brought to a total of over 12,000 by two substantial national institutions, the army commando school and an orthopaedic hospital. The town lies on the shores of a large lake, and fishing still brings in a proportion of the income, but

nowadays the economy of the town is based on the international export of locally grown apples. All Egirdir families own orchard land outside the town, and all have benefited to some degree from the apple boom.

In general terms, most townspeople are both committed Republicans and committed Muslims. However, in spite of their self-image as a uniformly “middle-class” community, large differences in wealth are now emerging and there are distinct strata in the town based on differences in socio-economic status and life-style. As we shall see, there is a relation between these “classes” and their differing emphases on Islamic or Republican values, and concepts of gender. In particular, the relationship is suggestive of the meaning that movement and ziyaret have in women’s lives: all women of the town are involved in ziyaret visits to senior kin, while usually only women from the more “traditional”[95] households are involved in ziyaret visits to shrines. Although this difference is important to my argument, it should not obscure our understanding of the even greater similarities in the situation of all townswomen when compared to that of men.

*** Respect and authority

In Egirdir, and indeed in Turkey generally, the concept of respect (saygi; hurmet) is of key importance in the ordering of all social relations.[96] Most importantly, the Turks believe that respect for God should guide the actions and belief of all Muslims. Relations between Turkish citizens and the state are also constructed in terms of respect — as are relations between young and old, women and men, the ill-informed and the educated. Indeed, the generic concept of respect, buttressed by a comprehensive social etiquette and a complex symbolic idiom related to bodily control and stasis as opposed to movement, is used to create hierarchies of authority in all areas of social life.

Respectful behaviour in all contexts is associated with religious merit (sevab), God’s blessing, and reward for piety and meritorious action. Relations of respect are derived by analogy from the respect due from man to God. The analogy is developed in the context of

gender in terms of an elaborate theological anthropology which associates men with greater, and women with less, reason (akil) and control of their animal souls (nefs). Women, in order to merit God’s promise of salvation, must overcome, through discipline and control, the impediments associated with their carnal nature.

These ideas create a fundamental difference between the sexes in the scope that they have for independent voluntary action and movement outside the household. Within certain broad limits, a man is free to determine his own actions within the community, and the respect he is accorded as a manly adult is directly related to his autonomy. By contrast, a woman’s

autonomy is limited and she is expected to be circumspect in all her actions, particularly those which take her outside the home. Indeed, only the respect accorded to age qualifies women’s inferiority to men: men as well as women have an obligation to respect women who are older than themselves, though this is not in fact associated with a greater freedom of movement outside the home for older women.

Women, as well as men, accept their ascribed statuses and the comprehensive hierarchy of authority and control with which they are associated. Yet, to the outsider, the question arises, how do women, who are defined as intrinsically inferior, come to terms with their inferiority? What elements are there in their characterisation and practice of Islam which continue to foster their religious commitment and perhaps offer them compensations or consolation for their subservient position? And, finally, how do women reconcile their temporal disabilties with their potential equality with men in paradise? In what follows I suggest that the complex relation between the ideology of respect and the notion of ziyaret serves both to constrain and to facilitate movement and exchange among women, thus allowing women certain areas of action while ultimately reinforcing the ideology of the passive subordination of women to men.

*** Women and movement

Egirdir women see themselves as confined to their homes by considerations of propriety and by domestic duties, and they greatly value opportunities for movement outside. Older women remember that not so long ago women never went anywhere except to visit their neighbours, so that bayram (or ‘Id) visits and trips to local shrines (all ziyaret), and the women’s picnics, were very special indeed. Although both women and men agree that attitudes towards movement changed, and became more open (aqik) during the 1950s — when people realised they could actually leave the town

— in practice, the changes have been limited with regard to women’s movements. Women can now shop in the town, and they travel to wedding receptions in Isparta (the provincial capital) and elsewhere by hired coach — either with their husbands or in groups of men and women — but neither these nor other types of movement are undertaken without the express permission of the men of the households in which they live. The contrast between the openness of men’s actions, and the closed (kapali) behaviour required of women remains relevant, and the formal occasions for movement continue to be of considerable importance to women.

Today, those occasions which women consider to be the most important opportunities for movement can be divided into two categories. Each category includes a major type of ritual movement, which the townspeople describe in terms of the concept of ziyaret. The first of these analytical categories includes women

and men acting together as quasi-equals to pay ziyaret visits to senior relatives; the second category includes single-sex groups of women who visit local shrines (ziyaret). Members of all families in the town are involved in the rituals of the first category, whereas usually only the women of more “traditional” families are involved in the range of activities included in the second.

More generally, the first category concerns the celebration of most of the important religious and secular festivals. These require movement to and from sacred spots or respected individuals. In Egirdir, these activities involve women and men ofa family travelling or visiting together and enjoin their companionship and good-natured attitudes of mutual respect.

Predominantly, such occasions comprise the following: the hajj and the little pilgrimages (Turkish, umre hac) to Mecca; family visits to senior kin and to family graves, on §eker Bayrami at the end of the Ramazan (Arabic, Ramadan), the month of fasting, and on Kurban Bayrami, the Feast of Sacrifice; and family picnics on occasions such as the third day of §eker Bayrami, the festival of Hidrellez, and the civic festivals of Children’s Bayram and Youth and Sport Bayram.[97] These occasions allow women significant opportunities for movement in the company of men and are positive in their various associations: they are occasions of explicit joy and thanksgiving. Their symbolism is associated both with the notion of sacrifice and its reward — a blessing (sevab) — and with greeting gestures of respect which are reciprocated with sweets and material gifts.

The second category includes those occasions when women alone may leave their houses in the company of other women. Such occasions comprise women’s participation in the formal visiting or reception days (kabul gunu), mevlud recitals, ziyaret visits to shrines, the celebration of fulfilment of vows (adak); and the women’s picnic, Kadin Pazari, at the end of the harvest period.[98] These occasions offer women particular opportunities to create movement symbolically, by signalling changes of personal status and marking their individual wishes and needs, particularly through the idiom of cooking. However, these types of occasion are considered by many local men and members of the local religious establishment to be of a dubious nature. Men typically dismiss this kind of movement outside of the home as trivial or superstitious, while women themselves are divided in their attitudes.

Women who accept “traditional” gender constructions relating to their work, domestic identity, and relations with men are also those who are most involved in those occasions in which women leave their homes in the company of other women. Others, who subscribe to what they see as more “modern” ideas about gender relations — including, in theory at least, a degree of autonomy and freedom of individual movement — generally ignore the opportunities that these occasions offer, and participate with enthusiasm only in the institution of formal reception day visiting. Thus, somewhat paradoxically, there seems to be

an inverse relation between certain “modern” gender constructs and women’s interest in, and actual movements outside, the home. Moreover, when “modern” women do meet in the single-sex gatherings of reception days, they often represent the status of their husbands and families and express little of themselves as individuals in their own right. By contrast, the more “traditional” opportunities that women have for movement on their own allow them a degree of autonomous action in settings where they can create and confirm their individuality vis-a-vis both other women and God.

*** Joyful celebrations and the movements of men and women

**** The hajj

Both the hajj and the “little” pilgrimages — in the past and today — provide the most important opportunities for men and older women to travel outside Turkey.[99] Though perhaps only twenty or thirty individuals from the town participate in the pilgimages annually, they have included members of all families in the town. The hajj journey is widely celebrated, both during the Feast of Sacrifice when the hajjis (Turkish, hacis) themselves make their sacrifice at Mina, and on their return.

Whole families (never men alone) may travel to Konya to greet their returning kinsfolk, the hajjis. As the coach caravan approaches

the town, townspeople throng to greet the pilgrims and join them in prayers in the main mosque, after which they are led home by close kin, friends, and neighbours. A goat is then sacrificed at their door, and the merit (sevab) of the vow which has been fulfilled is shared by all the well-wishers, who are invited to a special meal that ends with the eating of great dishes of sweets and the distribution of presents from Mecca.

Whereas men may make the pilgrimage alone, women must be accompanied by a male member of their family — ideally husbands and wives make the pilgrimage together. Although it is difficult to establish the extent to which this changes the conjugal relationship, women hajjis care greatly about the close friendships generated by the pilgrimage, including friendships between women and men, and they hope to make the “little” pilgrimage perhaps several times again.

Ziyarets and religious bayrams

There are considerable structural similarities in the rituals associated with the two most important religious festivals celebrated in Egirdir: §eker Bayrami at the end of the fast of Ramazan; and Kurban Bayrami, the Feast of Sacrifice. But their differences allow the former to be used as a model for ziyaret visiting and the latter as a model for relations created through sacrifice.

Early in the morning of the first day after Ramazan, when the men return from prayers at the main mosque, they are greeted by their children who are given money and sweets in return for a respectful kiss on the hand. Mothers are greeted next, and then each family, clothed in new garments, begins the round of bayram visiting, or ziyaret: first, to the household of the husband's parents, then to those of the wife, and then to all other kinspeople of the senior generation. Each visit begins with greetings, and juniors kiss the hands of the senior persons of the household who, in return, bless those who have greeted them. The guests are served coffee, sweets, and a plate of baklava. The occasion is usually very formal; conversation is perfunctory and as a new family group of guests arrives, earlier visitors depart. Each family may make ten or more such visits before mid-afternoon. Then the adults, if they have not done so the day before, may visit the cemetery — usually the only occasion when women may do so — and pay respect to their dead kinsfolk through prayer and readings of the Yasin sure (Arabic, sura, chapter) of the Qur'an.

On the second day of §eker Bayrami, the ziyaret visits continue — this time families of senior kin visit more junior and collateral

kin and neighbours — while on the third day each family organises a picnic meal at some local beauty spot, almost invariably one with a spring. For the three days, each nuclear family becomes a ritual unit: together they walk through the streets to pay respect to kinspeople and neighbours and together they join in the fun and relaxation of the picnic. Bayram visits are said to remind people of their roots and the value of respect; the appropriateness of these reminders is confirmed in the pleasure that family members share on the third day.

[[d-f-dale-f-eickelman-james-piscatori-muslim-travel-11.jpg][Figure 12.1 For pilgrims, domestic space becomes intricately linked to the Ka'ba, as suggested by this hajj mural on a house wall in Imbaba, Cairo. (From Juan E. Campo [1987] 'Shrines and Talismans: Domestic Islam in the Pilgrimage Paintings of Egypt', Journal of the American Academy of Religion, 55, no. 2, p. 292. Line drawing by Allan Grapard. Used with permission of the author and publisher.)]]

The Feast of Sacrifice also begins with men's morning prayers in the mosque, after which a man returns home and performs the animal sacrifice that commemorates Abraham's willingness to sacrifice his son, Isma'il, as an expression of his complete submission to God's

will. A portion of this meat is used to provide a festive meal for members of the family itself. Then, after they have eaten, the family again makes ziyaret visits, whose structure is very similar to the ziyaret visits at the end of Ramazan.

**** Family picnics

I have already mentioned the family picnics held at the end of Ramazan, whose timing, of course, depends on the Islamic lunar calendar. There are, however, other occasions when family picnics occur in association with the annual solar cycle. Of these, the most important are those associated with the festival of Hidrellez, on the 6th of May, when the Prophet Hizir is expected to visit the world. In the past, this was an especially important time for in-laws or families who had just arranged an engagement between them. They would share in the food preparations and visit a local spring (often one with a nearby shrine) for a picnic and recital of the mevlud poem commemorating the life of the Prophet Muhammad. Although the explicitly religious associations of this day are now tenuous, family picnics at Hidrellez continue to be a highlight of the spring season. Equally, two national holidays in the same season — Children's Bayram (23 April) and Youth and Sport Bayram (19 May) — have also become, probably only relatively recently, occasions for family picnics.

Picnics in all these contexts have explicitly paradisical associations for the townspeople. Springs are known as "the eyes of the world". The setting of green trees, meadows, and cold, clear flowing water is linked to an atmosphere of informality and good-natured fun, when women and men stroll (gezi) together and may join in traditional games and competitions. Even the picnic meals, although often lavish, are deemed by women to be effortless by comparison with the elaborate, oven-baked dishes of everyday fare and, uniquely, they involve both men and women in food preparation.

Though neither women nor men mention it, it is nevertheless clear to the outsider that these joyous occasions — the pilgrimages, Bayram ziyarets, and family picnics — share a common characteristic: all involve expressions of practical gender equality. As we have seen, the ideology of respect informs participation in both the pilgrimage and the bayram greeting rituals in which women and men, equally, are given their due respect as hajjis or senior relatives. Equally, women and men can recognise and reward such respect on the part of their juniors — who may also be both women and men. The case of family picnics is rather different, for the essence of the picnic ritual as a whole is not hierarchical but egalitarian; yet the consequences, from the point of view of women, are similar. On picnics, gender distinctions are relatively unmarked and the women and men ofa family are all more or less equal participants. Moreover, in all of these contexts, practised gender equality — through the ritual associations with the sacred centres of Mecca, the family, and springs, and through the idiom of sacrifice — offers women and men together a chance to experience a little of heaven on earth; it also confirms that all

Muslims are equal before God and that women, as well as men, may achieve salvation after death.

The multivocality of the rituals on these occasions, and the variety of ways in which they support a construction of gender equality, could be explored much further, but the data I have presented suggests the ways in which they differ from the second category of occasions when women, without men, may move outside of the domestic domain.

**** Women’s journeys alone

Women may leave their homes to join other women in four contexts: domestic visits to other households on formal reception days; mevlud recitals; ziyaret visits to shrines; and women’s picnics.

**** Visiting days and mevlud recitals

These two kinds of women’s gatherings have been described at length elsewhere (see Tapper 1983; Tapper and Tapper 1987a), and I will only summarise their main characteristics here. In Tapper (1983), I treated them as a contrasting set. They are similar in the

way that they mobilise women’s networks and in the extent to which they are disparaged and dismissed by men; they differ, however, in the ambiance that they create.

Visiting or reception days (kabul gunu) are a type of formal visiting among women which has come relatively recently to Egirdir. They are associated particularly with younger, educated, married women and the women of more affluent “secular” households, among whom such formal visiting is directly related to the ideals of individuality and consumer capitalism fostered by the Turkish state. Formal visiting is by invitation and is reciprocal, and the visiting circles thus created may meet regularly in the afternoons at the houses of the various participants. The ambiance of these gatherings, while ostensibly companionable, is often highly competitive. The hostess displays the cleanliness of the house, and its luxury goods, in much the same way as she displays her own gracious manners, good dress sense, and domestic skills in producing elaborate savouries and cakes. The structure of reception-day gatherings thus depends on the perception of equality among women participants, but their content is about inequality among wives.

Structurally, women’s participation in mevlud recitals is comparable to their involvement in formal visiting days, since invited women meet in private homes for this

religious service. By contrast to visiting days, however, the stucture of mevluds accepts differentiation among women as wives, while the content of mevluds — as intense religious experiences that focus on birth and motherhood — is about the equality of women.

Each mevlud is a commemoration of the life of the Prophet Muhammad in prayers, hymns, and the recital of the mevlud poem itself. Mevlud recitals are sponsored by women as intercessionary rituals held to gain religious merit (sevab) for the souls of the family's dead. Indeed, mevluds are regarded as presents for the souls of the dead, while those who participate in the services are themselves believed to gain merit (sevab) from their gifts. The sense of female solidarity, and the special relation between women of the congregation and the Prophet and the Islamic promise of salvation, are particularly evident in the more "traditional" mevluds — those in which women most commonly participate, and which are sponsored and preferred by those women who accept what are felt to be more "traditional" gender constructions.

However, some women, whose education, economic, and/or marital status links them closely to the secular ideals of the Turkish Republic, do not seek the opportunities for self-expression or consolation and support offered by the elaborate, "traditional" women's mevluds. Such women (often those who participate in formal reception-day circles) are most likely to sponsor mevluds that replicate the short, unemotional mevluds held by and for men (cf. Tapper and Tapper 1987a: 82).

The variation between different types of mevluds sponsored by women is particularly revealing of three things: the effect of more "modern" notions of gender on female solidarity; the import of the contrast between formal visiting days and mevlud gatherings; and the distaste that some more "modern" women express for the various kinds of exclusively female activities included in the second category of movement that I have distinguished. Only women who accept the more "traditional" ideas of gender participate regularly in the other activities in this category.

[100]

Ziyaret visits to shrines

The saints whose shrines remain to be visited are seen as active personalities (zat), to whom respect is due because of the greater respect which they showed to God. Miracle stories tell of the saints' extraordinary qualities and it is believed

that they have the power not only to punish disrespect but also to make positive interventions in the world of the living.

Most women say a fixed liturgy of Qur’anic prayers whenever they pass one of the town shrines, and in this (and in the regular prayers they utter when passing a graveyard) they show themselves to be more conscious than men of the sacred geography of the town and the opportunities for religious contact that it provides. Though men may on occasion visit shrines with the women of their own family, they do not visit shrines on their own; single-sex shrine visiting is an activity exclusively reserved for women. In general, men treat the women’s shrine ziyarets as verging on heresy and they invariably describe them in terms of the women’s desire for children. Women, by contrast, insist that the fundamental intention of their visits is to show respect, and only secondly will a saint be asked to intercede with God in response to a vow (adak).

Individual women may sometimes visit one of the remaining house-shrines in the town. Such visits are essentially private, as is the sorrow or heartache which the vows made on such visits seek to relieve. However, when women speak of ziyaret visits, they usually refer to the relaxed occasions when they visit a shrine with a group of kinswomen, friends, and neighbours. The shrines that are visited in this way are most often those on the periphery of the town and the walk there provides women with one of the few opportunities

for strolling (gezi) by themselves — an occupation usually held to be appropriate only for men.

At the shrine a woman will vow that, should her request be fulfilled, she will make a return gift: she may undertake to say special prayers, make some charitable offering, or sponsor a mevlud service. Most often however, she may undertake to cook and share “hot” foods especially associated with religious merit (sevab); it is said in such contexts that food, like the rags and strings attached to shrines, “ties up the prayers”. Thus, if the woman’s request has been substantial, she may hold a special service known as a “vow prayer” (adak duasi). She will invite a few of her closest kin and friends to her home at a time when there are likely to be no men in the house. Then one of the women, or a woman religious teacher (hoca), will read the Yasin sure of the

Qur’an seven times while all the other women, in total silence, will take turns stirring a pot of irmik helvasi, a sweet pudding associated with all traditional formal meals. Together the women then eat a substantial meal followed by the helva (Arabic, hilwa).

In their ziyaret visits to shrines women have a considerable degree of autonomy — to choose their company, to manage the outing, and to construct a personal relationship with God via the saint. Women in Egirdir, as elsewhere, are not allowed to take a creature’s life. However, the substitution of a cooked, vegetable food offering in lieu of an animal sacrifice — which is the usual idiom of thanksgiving — makes it possible for women to perform the complete ritual sequence of a shrine visit without recourse to men. This kind of substitution is imitated on other occasions when women alone seek to adjust their own or their families’ ritual condition.

**** Women’s picnics

In the past in Egirdir, women’s picnics were important events of the annual cycle, which had their counterparts in single-sex parties for men, in the winter and at Hidrellez. Although the most important of the women’s picnics, Sekibag, which was held in early May, ceased to be observed some two decades ago, it remains a model for the one women’s picnic, Kadin Pazari, which continues to be celebrated today.

Kadin Pazari was, in the past, a three-day celebration held each autumn. Groups of women left their orchard homes together to meet on the first day at the river outlet of the lake, then on the next at a nearby spring, and on the third at a yet larger spring which was also the site of the autumn food market where women would buy great quantities of meat, vegetables, and fruit to be preserved for the coming winter. On the third day, young betrothed girls were given new clothes by women of their fiance’s family, and other young girls and young married women dressed in their most up-to-date clothes. The women ate, sang, danced, played traditional games, and took the opportunity to explore — strolling along the surrounding lanes and clambering up nearby hillsides.

Today, although the need to buy foodstuffs for winter preserves has largely passed, a single day of Kadin Pazari, held on a Sunday at the large market-site by the largest of the springs outside town, continues. Though new brides are no longer dressed at the picnic spot, women no longer dance, and men are no longer so rigorously excluded (newly married couples now may come together), the women’s picnic day remains an impressive event. Hundreds of women, in groups of ten or fifteen, don smart clothes and prepare elaborate picnic dishes. The effort and display is for the picnickers themselves, an indulgence the women thoroughly enjoy. The picnickers stroll around the stalls and young and old alike will join traditional running games that demand cunning and swiftness of foot. The day comes to an end with a scramble to catch the last buses back to town before night falls.

Traditionally, the women’s picnics were a celebration of female sexuality and fertility and of the friendship, solidarity, and support among women, both kin and affines, young and old. The Kadin Pazari outing continues to create and confirm the women’s sense of identity and

worth as women, while its timing and watery associations link it explicitly to general notions of fertility and abundance.

*** Ziyaret, gender, movement, and exchange

I have distinguished for analysis two categories of occasions which afford women valuable opportunities to move outside their domestic environment. This analytic division of opportunities for movement according to the criterion of gender offers insights into the relationship of gender and religion. Among these, perhaps the most important is a recognition of the extent to which, through opportunities for movement, women's inherent subordination to men in the Islamic tradition is modified and alleviated.

Women's and men's ziyaret visits on the occasions of the two major Islamic festivals make them more or less equal in their subordination to senior kinfolk. By the same token, gender equality is a dominant message of those other ritual occasions (such as the hajj and family picnics) when women leave their households in the company of men.

By contrast, when women make ziyaret visits to shrines, they travel alone outside the household. On these occasions which, according to men, only confirm the gender stereotypes of women's inferiority, women are none the less able to construct an identity for themselves as women that is validated by the supernatural context in which it occurs. The possibility that women may have a relationship with the supernatural which is unmediated by men and unlike the other kinds of relationship that women and men have in common, such as that based on daily prayer, is most clearly seen in the women's visits to shrines, but it is also an important aspect of

the women's mevlud services and their annual picnic. However, there still remain contrasting attitudes between more or less "modern" and "traditional" women to formal visiting days and mevlud recitals. Those "modern" women who, in theory if not in practice, reject gender constructions which entail women's subordination to men also devalue and dismiss those occasions when women may separate themselves from men and emphasise their shared, positive identity as women per se and as women vis-a-vis God.

From the Egirdir material, is it possible to construct a more general hypothesis concerning the relation between gender and movement in the Islamic tradition? It seems possible that women's institutionalised movements outside their homes are everywhere likely to be construed, by women at least, in a positive way. However, the extent and frequency of such movements, and the degree to which they are emphasised in any particular society, vary

considerably. It is this variation which requires explanation. I suggest that, in part at least, the answer may lie in differing ideological constructions of relations between the sexes.

If women and men subscribe to the idea that the sexes are different in kind and that men are superior to women (as is the case in the more or less “traditional” notions of gender in Egirdir), women’s theoretical equality with men as Muslims becomes paradoxical and problematic, particularly for the women themselves. However, in so far as certain occasions for movement allow women to act as men’s equals, and others validate special dimensions of women’s nature, the paradox is partially obscured and partially denied.

If, on the other hand, women and men subscribe to the idea that the sexes are different in kind but essentially complementary in nature, or that the sexes are of similar human natures (both emphases occur in the more “modern” constructions of gender relations in Egirdir), then men’s and women’s equality as Muslims is not an issue. In these cases, women are likely to make journeys

outside the house as men’s equals, but there is little need for them to move in single-sex groups to recreate a special religious identity for themselves. Ziyaret visits to shrines, and other single-sex gatherings that have no counterpart in the activities of men, are likely to play little part in women’s lives.

In my discussion of the notion of ziyaret, among many possible themes, I have concentrated on the differences between those occasions when women and men travel together outside the household and when women travel alone. As we have seen, these latter occasions are often much valued by women, not least because of the opportunities that they offer to create personal identities by contrast with each other and with supernatural entities that are independent of their ascribed domestic circumstances. Such women’s movements, including reception-day visiting and picnicking activities on the one hand and women’s religious services and shrine visits on the other, would hardly seem to constitute a threat to men’s practical dominance of women’s lives. Yet these occasions when women travel and meet in single-sex groups are often disparaged and discouraged by men and by the religious establishment. Following Parry’s elegant discussion of theories of reciprocity (1986), I shall argue that the content of the women’s exchanges on these occasions may explain why they are derided by men with such dismissive hostility.

Parry makes a clear distinction between two extreme ideologies of reciprocity, which, he suggests, define each other. The first is the ideology of the “pure gift” given to a supernatural entity as part of a quest for salvation. The second, and related, ideology is that associated with the self-interest of market exchange. Here nothing is ventured without the expectation of at least an equivalent return. Parry suggests that the notion of the “pure gift” is stressed particularly in the traditions of the ancient literate civilisations of Europe and Asia and that it contrasts with the kind of reciprocity involved in market relations. He writes: “the

ideology of the ‘pure gift’ is most likely to arise in highly differentiated societies with an advanced division of labour ... and a significant commercial sector” (Parry 1986: 467). The “pure gift” is defined as what market relations are not: “altruistic, moral and loaded with emotion” (Parry 1986: 466).

Though he does not use Islamic material, there can be no doubt that Parry’s insights are as relevant to the Islamic tradition as they are to other world religious traditions of the Indian sub-continent and Europe. More specifically, the Turkish material that I have presented seems particularly fertile ground for exploring the implications of his ideas with regard to the concept of ziyaret

and women’s movement (cf. Betteridge 1980; 1985).

Richard Tapper and I have described in detail elsewhere (1987b) how in Egirdir the paired ideologies of modern Turkish Islam and Republicanism are, each in its own sphere, highly valued orthodoxies, supported by the religious establishment and the state respectively. In practice, they also govern all aspects of the townspeoples’ lives. Within each of these ideologies, we find notions of both “pure gift” (the stress on self-sacrifice and subservience of the individual) and “market mentality” (calculations of personal merit and advancement and the values of consumer capitalism) combined.

With respect to both ideologies it is clear that women suffer particular disadvantages compared with men. Women cannot participate as men do in the “pure gift” economy of salvation — as expressed in public prayers, in military service, and in the notions of sacrifice which inform the concept of responsibility in religious and civic contexts. Nor do women have the same facility of access or degree of control over political and economic resources: they are thus excluded from many forms of charitable work and achievement in the market economy. In all these various secular and religious contexts, gender constructions preclude women’s full participation; their involvement in the range of valued activities is vicarious and dependent on or mediated by men. In this way, the relationship of women to the dominant ideologies and culture of the town is clearly secondary to that of men.

When women are involved in travel outside the home in the company of other women, however, the rituals of reciprocity in which they engage have a quite distinct character and are unlike those of men. The women’s exchanges are not expressions of the extreme ideological forms of the “pure gift” or the market. Rather, they combine muted elements of both: social and temporal aspects of the exchanges are emphasised in what amounts to a give-and-take kind of reciprocity in which offerings are made for favours (cf. Parry 1986: 462).

I shall illustrate this by two quite different examples. First, in the case of women’s vows made at ziyaret shrines, although the women insist that the intention (niyet) is of paramount importance, the vow that they make is a contingent promise — an “offering for a boon” not a “pure gift”. Second, by way of thanksgiving should the vow be fulfilled, the women, who cannot themselves follow the model of Abraham and sacrifice a beast, perform an act which is “superstitious” (because it is not validated by establishment traditions), and cook helva to be shared and eaten among themselves. Equally, the self-defined “modern” women, who reject

most single-sex activities in favour of secular definitions of their equality with men, nevertheless meet for formal receptions days. When they do, it is not as full participants in the market economy, but as conspicuous consumers whose consumption, and thus relative social power, derive from their dependent relationship upon the men of their household.

The social and psychological compensations which women gain in their contacts with other women outside the home can be considerable, not least because the women’s own activities form systems of exchange that modify elements of the two dominant ideologies of reciprocity while at the same time avoiding the logical disjunction of the two. Ironically, precisely because the women’s activities blur the kinds of exchanges which are well-defined and prestigious in terms of orthodox religion or the Turkish state, women confirm, to men and themselves, their distance from the sources of both supernatural and secular power. In each case the exchanges associated with women’s movements outside the home become a further expression of women’s marginality and dubious orthodoxy, while their inferior gender status becomes a self-fulfilling ideology in itself.

*** Acknowledgements

Following the Social Science Research Council conference on Movement and Exchange in Muslim Societies, a draft of this chapter was presented at the Middle East Center, University of Pennsylvania, and at the 1987 Middle East Studies Association meeting in Baltimore. I would like to thank my colleagues on those occasions, including Dale Eickelman and James Piscatori, for their helpful comments and suggestions.

[94] Anthropological fieldwork in Turkey was done over a period of fifteen months between 1980 and 1984 and was sponsored by the Social Science Research Council (UK), Project HR 7410. The fieldwork was done jointly with Richard Tapper, whom I thank for his incisive comments on the present paper. Further discussion of the Turkish ethnography can be found in Tapper (1983, 1985) and in Tapper and Tapper (1987a, 1987b).

[95] The townspeople themselves use the contrasting notions of “tradition” and “modernity” to classify many aspects of social organisation and structure, as well as to characterise the life-style and degree of religious commitment of various Egirdirli families. The indigenous use of these ideas is explored in detail with respect to wedding customs in Tapper (1985 and unpublished manuscript).

[96] The two words, which are often used synonymously, convey notions of esteem, thoughtfulness, consideration, honour, reverence, and veneration (cf. Redhouse 1968: 498, 990; cf. also Beeman’s (1986) discussion of ta‘arof and ziarat kardan in Iran.

[97] In the past this category would also have included the great collective migration of all the families of the town to their orchard houses at harvest time in September.

[98] Traditionally, this category would also have included the three other women’s “picnics”: the first in early spring; the second — and most important — in May (Sekibag); and a third in late autumn. However, such past occasions, which the townspeople now term piknik, were not known by a single generic term but rather by their special local names.

[99] Military service, traditionally and today, obliges local men to leave the town, but such service has always been compulsory. In the past, local men were also involved in seasonal labour migration to the provinces of the Aegean coast. Today, in spite of the importance of labour migration from Turkey to Arab countries and Western Europe, very few men from Egirdir are involved in this process.

[100] See also the detailed account of women’s shrine visits in Turkey given by Olson (1987 and forthcoming).

*** Annotated bibliography of related studies

Martin’s (1987) “Muslim Pilgrimage” provides an excellent concise introduction to the topic. The articles “Hadjdj” and “Hidjra” in both editions of the Encylcopaedia of Islam (1st edn, 1913–38; 2nd edn, 1960-EI²) remain useful, but narrowly interpret their respective topics. Thus the EI² article on the hajj (pp. 31–8) is divided into sections on the pre-Islamic era, the origins of the Muslim hajj, the stages in the hajj to Mecca, ‘Arafat, and Mina, and general notes on the hajj in modern times. All but the last section of the article primarily update the treatment of the topic in the earlier edition. W. Montgomery Watt’s EI² article on the hijra (pp. 366–7) deals exclusively with the topic in seventh-century Arabia.

Metcalf (Chapter 5 of this volume) provides an accessible guide to hajj accounts written by pilgrims from the Indian sub-continent. Matheson and Milner (1984), whose work in part inspired Metcalf’s, deal with South-east Asian texts. Esin (1963) offers a particularly sensitive, beautifully illustrated account of the hajj. Abdul-Rauf (1978) also provides an extensive bibliography. Iranian novelist Al-e Ahmed’s (1985) day-to-day account of his pilgrimage will dispel the notion that this genre of literature is only devotional.

On the medieval rihla, Dunn’s (1986) account of the great Muslim traveller Ibn Battuta (1304–68) is both comprehensive and entertaining. The chapters by Gellens and El Moudden (Chapters 3 and 4 of this volume), dealing with the medieval and late medieval periods, are usefully complemented by Harvey (1988) on the role of the hajj among Muslims in Spain under Christian domination. His discussion of the religious leadership provided by women merits particular attention. Much work remains to be done in understanding the roles of movement and travel in the religious imagination in medieval Muslim societies. Studies such as those of Gellens, El Moudden, and Harvey suggest that the topic is beginning to receive appropriate attention. For the modern period, the account

of the rihlas of Muhammad Rashid Rida’ (1865–1935) to the Hijaz as well as to Europe indicates the importance of travel for learning in the modern period and suggests how it led to the development of modernist Islam (Rida’ 1971).

Of the numerous nineteenth-century European accounts of the pilgrimage, two merit particular attention. Burton (1964 [orig. 1893]) is self-important but never dull and conveys much useful information. Snouck Hurgronje (1931 [orig. 1888–9]) provides an unusual

ethnographic account of Mecca with important information on the organisation of the pilgrimage. Muslim accounts are particularly fascinating for this period because European economic and political domination had an increasing influence upon the conduct of the pilgrimage itself (McDonnell, Chapter 6 of this volume) and upon the hajj accounts as a literary genre (Metcalf, this volume). Bezzaz (1982–3) analyses the perils of the pilgrimage from nineteenth-century Morocco, based upon contemporary Moroccan accounts and early efforts by Morocco's rulers to curtail the exploitation of pilgrims. Gallagher (1983) describes how "health" considerations provided a rationale for the growing regulation of the pilgrimage by European powers. For the twentieth century, Zainuddin (1978), the first Malaysian Pilgrimage Control Officer for Malaysia, provides valuable insights into growing governmental control of the pilgrimage, a trend perhaps even intensified in the post-colonial era. The fact that he was also a Special Branch officer suggests the political significance imputed to the hajj by colonial authorities.

Among contemporary studies of the pilgrimage, Birks (1978; also see Naqar 1972), one of the first studies by a social scientist to cross disciplinary lines in the study of the hajj, focuses upon the present-day overland pilgrimage routes from West Africa. Long (1979), who describes the practical organisation of the contemporary pilgrimage, is now complemented by the ongoing studies of the Hajj Research Centre in Jidda. The first volume of the Centre's Hajj Studies, co-edited by Ziauddin Sardar and M.A. Zaki Badawi, appeared in 1978. A related bibliography (Sardar 1982), dealing with the hajj in all its aspects, includes dissertations and unpublished studies conducted by the Hajj Research Centre itself. Kramer (1987), who provides abundant references, reviews current efforts to politicise the hajj.

For the purposes of this volume, the chapter by Peters (1986) on "The pilgrimage network' (pp. 27–59) is especially relevant. His concern is to "translate" the "high tradition of ideology and institutions" of Christianity, Judaism, and Islam in Jerusalem and Mecca "into the earthly vernacular of places, buildings, and streets,

of buying and selling, and finding bed and board" (p. ix), including discussions of the linkages between primary and secondary religious centres and shrines, and between sacred and secular (particularly mercantile) activities. Roff (1985) outlines the theoretical implications of studies of the hajj.

Although Turner (1973; also Turner and Turner 1978) deals only incidentally with the Muslim pilgrimage, his account is useful for comparative purposes and is a point of critical reference for later studies (e.g. Bowman 1988). Also useful for comparison are Werbner (1977), who deals with regional shrines and visits (ziyaras) in both Muslim and non-Muslim societies, and Abeles (1988), who describes a secular counterpart to pilgrimage with a "religious dimension".

Recent studies of the pilgrimage, as Werbner (in Bowman 1988: 22) and others note, place emphasis on how “the pilgrimage experience is effectively a construct of the people using it rather than something that itself gives form”. In this regard, Maeda (1975) represents an early empirical study of the consequences of undertaking the pilgrimage for social status in the pilgrim’s home community in Malaysia. In a more recent study, Campo (1987) explores the multiple levels of significance of the hajj for Egyptian pilgrims. He analyses the murals commissioned to decorate the facades of the homes and shops of returned pilgrims. Campo argues that these murals are collective enterprises that reflect the expectations of the pilgrim, his family, and neighbours. Campo (1987: 293) argues that the iconography and epigraphy of the murals are highly structured forms of expression, “like that of certain types of myth, epic, poetry, and ritual”. They demonstrate a complex relationship between the two “homes” of the pilgrim — Mecca and his dwelling of origin. Unlike the “discursive” formulations of Islam of both rulers and militant opposition groups, hajj murals “testify to a concern for linking mundane domestic space and its realm of familial values with Islamically formulated definitions of sacred power and space” (Campo 1987: 302; 1990). A more recent essay by Campo (forthcoming) examines “the interrelationships between political authority, ritual, and spatial order in the context of the history of Islam”, showing how pilgrimage rituals “embody and validate configurations of power, of dominance and submission”.

If Campo deals with the links between domestic space and the pilgrimage to Mecca, Peters (1986) and others suggest the equally intricate links between the pilgrimage to Mecca and regional shrines. Algar (1971) is useful as a case study. He writes: “The convergence of the pilgrimage routes at the Ka‘ba mirrors the meeting of the Sufi paths at that central point — haqiqat - to which

they all lead” (Algar 1971: 197). Eickelman (1976) discusses a regional Moroccan shrine, and elsewhere (1989: 288–304) provides key references to discussions of Sufi orders and shrines throughout the Muslim Middle East. Shinar (1980) discusses the politics, rivalry, and shifting audiences of North African regional religious leaders during the colonial era, and Stillman (1982) compares Jewish and Muslim shrines and saints in North Africa.

The classical points of reference for doctrinal thought on emigration (hijra) are the early years of Islam and medieval Islamic jurisprudence (Masud, this volume). Contemporary interpretations of hijra show a range of variation. Some activists (e.g. Faruqi 1985) go so far as to say that the only legitimate reason for Muslims to remain in the west is the call to Islam (da‘wa), proselytisation. The fact that the Egyptian extremist organisation responsible for the assassination of Sadat was called, at least by those hostile to it, the “Society of Excommunication and Emigration” (hijra) has inspired chronicles of religious extremism linked loosely to the concept (for Egypt, see Hammuda 1987). The exposition of hijra by ‘Uthman dan Fodio (1978) in the early nineteenth century, available in English, provides a complex discussion of the relationship between hijra and jihad and also offers insight into the relationship between the doctrine and the reformist movement that he inspired. In

Wahhabi doctrine, the notion applies to the settlement of bedouin and their formation into a military force to achieve Wahhabi goals (Habib 1978).

Ferre (1985) focuses upon how migration and travel influence proselytisation in various historical epochs, while Oded (1986) deals with modern migration to the Arab “centre” from Africa for educational purposes. Qureshi (1979) deals with the Khilafat movement (1918–24) in British India, in which between 10,000 to 60,000 Indian Muslims, in spite of adverse economic and political realities, were encouraged by their leaders to interpret doctrine literally and emigrate to Afghanistan in 1920.

Until quite recently, studies of migration in the social sciences, however valuable in other respects, have tended to neglect its implications for religious experience (e.g. Bourgey, Gorokhoff, Nancy et al 1985; Owen 1985; Seccombe 1985; Serageldin et al. 1984; Weiner 1985). However, Ahmed (1986) presents a case study of a contemporary religious movement in Pakistan primarily associated with Pakistani workers returned from the Arabian Peninsula. Some Muslims point ironically to the fact that Muslims in western countries, freed from the political restraints of their countries of origin, can be more creative and open in religious expression and practice. “Western” countries increasingly serve

both as a meeting place for Muslim activists from throughout the Muslim world and as the primary residence of an increasing number of Muslims. Whatever one’s literary (and political) judgement on the merits of Rushdie (1988), he is surely accurate in depicting his novel as “an attempt to write about migration, its stresses and transformations, from the point of view of migrants from the Indian sub-continent to Britain” (Rushdie 1989). As one commentator wrote:

Just as the immigrant speaks his new language with an accent, his vision will acquire an accent. It seems that a different light, a different color, has been cast on everything he has known before ... So the immigrant’s task is to struggle for some kind of peaceful coexistence between the old value system and the new one.

(Modaressi 1989)

If Rushdie’s experience indicates the strength, and limits, of the immigrant’s experience in challenging and shaping the religious imagination, more standard academic accounts indicate the significance of the experience of migration for the religious imagination, a situation increasingly recognised by Muslim activists (see Hijra 1986). By early in the next century, current projections indicate that adherents to Islam will constitute, after Christianity, the second largest religious grouping in the United States (Haddad and Lummis 1987: 3). Studies by Kepel (1987), Kepel and Leveau (1987), Alia (1989), and the French

polling organisation IFOP (1989) — the first public opinion polls of Muslims in France — are particularly effective in tracing the changing religious sensibilities and practices of France's Muslim communities, which as of 1987 comprised between 2.5 and 3 million persons. For Islam in Europe as a whole, the essays in Gerholm and Lithman (1988) and by Halliday (1989) offer a useful point of departure. Elsewhere, Fisher (1986) deals with immigration to towns in West Africa.

*** Glossary[101]

adhan (A) Muslim call to prayer.

akil (T from the Arabic ‘aql) reason, reasoning, intelligence.

alamanci, almanci (T) Turkish worker in Germany; lit. “Germanish/like”.

alamanya (T) Germany.

‘alim (A, pl. ‘ulama’) learned man; in particular one learned in Islamic legal and religious studies.

‘allama (A) honorific title for a learned person.

alman (T) German.

‘amma (A) the “masses”.

anavatan (T) mother country, homeland.

ansar (A, sing, nasir) supporters; companions of the Prophet Muhammed who accompanied him from Mecca to Medina.

‘arab (A) Arabs; bedouin.

‘arffin (sing, ‘arif) (A) mystics.

aym-i cem, cem (T) Central Asian communal ritual, led by pir or dede. Both men and women participate.

bakal haji (Malay) a person preparing to perform the hajj.

baraka (A) supernatural blessing; quality of divine grace; abundance.

bay‘a (A) pact, pledge.

bay‘at al-hijra (A) the pledge to emigrate.

bay’at al-nisa ’ (A) the women’s pledge.

bayram (T) religious or national holiday or festivity.

begum (Urdu) lady, queen, title used for Mughal women.

berkat (Malay, from the Arabic baraka) blessing.

bey (T) Turkish military title for official in charge of a beylik or Ottoman administrative division.

bomoh (Malay) traditional Malay medical man or practitioner or curer.

cennet (T, from the Arabic janna) paradise, heaven.

communitas sense of community or fellowship.

dakwah (Malay, from the Arabic da‘wa) call, propagation; a generic term for Islamic missionary activity in Malaysia and elsewhere.

dar al-‘ahd (A) the land of the pact; dar al-aman (A) “the land of peace”; dar al-harb (A) the “land of war”, enemy territory; dar al-hudna (A) the “land of peace”; dar al-iman (A) the “land of faith”; dar al-Islam (A) the “land of Islam”, the Islamic World; dar al-kufr (A) the “land of disbelief”; dar al-sulh (A) the land of “settlement” or truce.

dato, datok (Malay) honorific title granted by the king.

dede (T) Alevi holy man; also grandfather, shaykh of a dervish order.

dey (T) Turkish or Algerian Ottoman military title, generally an office superior to that held by a bey.

dhimmi (A) non-Muslim “protected” person.

dinar (A) unit of currency.

dirham (A) unit of currency.

dunya (T, from the Arabic dunya) world (bu dunya this world, obur dunya other world).

ehl al-dunya (T, from the Arabic ahl al-dunya) worldly people.

evliya (T sing., from Arabic plural awliya’) Muslim saint or saintlike person.

fada’il (A, sing, fadila) merits or special qualities of people or places.

faqih (A, pl. fuquha) Islamic legal scholar; jurist.

fard(A, pl. fara’id) fundamental Muslim obligation.

fard kifaya (A) collective duty in Islam.

fatawa (A, sing, fatwa) formal legal opinions or advice issued by a recognised Muslim scholar.

fiqh (A) Muslim jurisprudence.

Gastarbeiter (German) “guestworker”.

gavur (T) infidel, unbeliever.

gavuristan (T) land of infidels.

gecekondu (T) lit. “built at night”; shanty or squatter towns.

gezi (T) stroll, excursion, outing.

ghamma (A) spoils of war.

ghuraba ’ (A, sing, gharib) foreigners or non-natives.

gurbet (T) exile, state of being away from home.

gurbetqi (T) one who is in gurbet.

hadith (A, pl. ahadith) reported words of the Prophet Muhammad, based on the authority of a chain of reliable transmitters.

hajj (A) (T hac, Malay haj) the Meccan pilgrimage, and the rites

there; hajj, hajji, hajja, one who has performed the pilgrimage.

hanafi (A) one of the four major “schools” of Sunni legal doctrines; the official school of the Ottoman Empire.

haqiqa (A) reality; mystical truth.

haram (A) forbidden.

haramayn (A) the two sacred places of Mecca and Medina.

hareket (T, from the Arabic haraka) movement, act, deed.

harman (T) heap of grain; colloq. threshing place.

Hidrellez (T) 6 May, the 40th day after the spring equinox, often thought to be the beginning of summer; associated with legends of the prophets Hizir and Ilyas (Elias).

helal (T, from the Arabic halal) approved.

Hijaz (A) the Arabian province which includes Mecca and Medina.

hijra (Urdu hijrat) migration.

hillula (H and A) festival for a Jewish saint.

Hizir (T, from the Arabic al-Khidr) legendary prophet who attained immortality by drinking from the water of life.

hosaf (T) cold drink of stewed fruit.

hubus in North Africa, a religious bequest, synonymous with waqf.

hurmet (T, from the Arabic hurma) respect, honour, sacredness.

ibctdai (A, sing, ibctda) ritual duties, including ablutions, prayer, almsgiving, fasting, pilgrimage to Mecca, reading the Qur’an, and recollection of God.

‘id (A) festival; id al-Adha, Feast of Sacrifice (during hajj), ‘id al-Fitr, festival marking the end of the fasting month.

ihram (A) seamless garment worn by pilgrims in Mecca.

ikinci ku§ak (T) second generation (foreign children born or raised in Germany).

imam (A) prayer leader.

isnad (A) the chain of transmitters of authentic tradition (hadith).

izin (T) leave, permission, consent.

izinli (T) one who is on leave.

jamaa‘a (A) organisation.

jawa (A) members of the Malayo-Polynesian language group resident in Mecca.

jihad (A) striving, effort; jihad f sabil Allah, striving in the way of God, if necessary, war in this cause.

Ka‘ba (A) the square building in the sanctuary in Mecca which contains the Black Stone and is the focus of the hajj.

kabulgunu (T) women’s formal visiting or reception days.

kadinpazari (T) women’s autumn picnics.

kafir (A, pl. kuffar) unbeliever in the Islamic revelation.

kalam (A) scholastics.

kampong (Malay) village.

kapali (T) covered, closed.

karamogo (Manding) a scholar, a person learned in the Islamic faith and qualified to teach at an advanced level.

kathi (Malay, from the Arabic qadi) religious magistrate.

kerajaan (Malay) government, symbolic nationhood or kingdom.

kesin donu§ (T) permanent return (to Turkey from Germany), repatriation.

ketua (Malay) a village headman.

kharaja (A) to go out.

khassa (A) elite, distinguished.

khatib (A) preacher, the person who delivers the Friday sermon (khutba) at the noon prayer of assembly.

khenduri (Malay) a village headman.

khirqa (A) a ritual garment symbolising a Sufi follower’s obedience to the rule of his tariqa; the tattered woollen mantle of the Sufi worn to symbolise poverty.

kufr (A) disbelief.

kurban (T) sacrifice; Kurban Bayrami (T, Arabic ‘Id al Adha) feast of sacrifice.

kutsal (T) sacred, holy.

lahu rihlatun (A) lit. “he made a journey”; typical sentence in the biography of an ‘alim.

lira unit of currency.

lo (Manding) initiation societies among the Dyula.

ma‘dan (A) greenhouse, place where things are grown.

madrasa (A) school, often associated with a mosque.

mahdi (A) the expected, divinely guided leader.

mahshasha (A) a cafe or popular urban gathering place.

makhzan (A) in North Africa, the central government of the tribes in its service.

maliki (A) one of the four major schools of Islamic jurisprudence, predominant in North Africa.

masjid (A) mosque.

mawsim, musim (A) “season” for a celebration; in North Africa, a rural or tribal fair, often held under the auspices of a patron saint.

mevlud (T, from the Arabic mawlid) a religious service commemorating the birth of the Prophet Muhammad.

milla (A and P; millet T) religious community or, in some contemporary contexts, “people” or “nation”.

misbaha (A) a rosary.

mory (Manding) a hereditary category of Dyula Muslims who were expected to conform religiously to the strictures of the shari‘a.

mu’akhat (A) brotherhood.

muezzin (A, mu’adhdhin) prayer-caller.

mufti (A) a jurisconsult; an issuer of fatwa.

muhajir (A, pl. muhajirun) emigrant, Meccans who emigrated to Medina in the early period of Islam.

muhtar (T, from the Arabic mukhtar) headman.

muqaddam (A) a circle or sectional leader in a Sufi order; in North Africa, a Sufi representative capable of formally initiating followers into a tariqa.

murabit (A) often rendered in French as “marabout”; a person living or dead believed to enjoy a special relationship with God which enables him or her to channel God’s graces or blessings.

mushrik (A) believer in more than one God.

mustad’afn (A) weak, oppressed.

mutawwif (A) pilgrims’ guide in Mecca.

muwalat (A) friendship.

namaz (T) prayer ritual.

nasta‘liq (A) the distinctive writing style for Urdu and Persian.

nefs (T) from the Arabic nafs) personality, soul, flesh, and bodily desires.

niyet (T, from the Arabic niya) intention, formal resolve to perform a religious act.

penghulu (Malay) traditional title for a lesser chief; district-level state bureaucrat.

piknik (T, from the English) picnic.

pir (T) Alevi holy man, from a holy lineage; leader of a dervish order.

qadama (A) to reach, arrive, get to.

qadi (A) Muslim judge, magistrate.

Qadiriyya (A) a Sufi order, tracing its origins to ‘Abd al-Qadir al-Jilani (d. 1166). Qadiri, an adherent of the order.

qanun (A) law; state law.

qira’a (A) recitation of the Qur’an.

qubba (A) a dome; a domed building or memorial shrine.

rafidi (A) member of a heretical group.

Ramadan (A) Islamic month of fasting.

riba (A) usurious interest.

rihla (A) travel, often for religious knowledge; rihla hijazyya (A), the pilgrimage trip, travel account of the pilgrimage; rihla sifariyya (A), travel account of, for instance, an embassy mission.

riwaq (A) cloisters around a court; living quarters, dormitories, and workrooms of the students of al-Azhar University in Cairo.

sam‘ (A) attention.

saraka (Manding, from the Arabic sadaqa) voluntary charity; among the Dyula refers to a variety of prestations, including those obligatory prestations made during life-cycle rituals.

§art (T) condition; stipulation.

saygi (T) respect, esteem, consideration.

sefer (T, from the Arabic safar) journey, voyage, travel.

§eker Bayrami (T, Arabic ‘Id al-Fitr) the feast following Ramadan.

sevap, sevab (T) religious merit acquired by good action.

seyahat (T, from the Arabic sayaha) journey, trip, expedition.

shari‘a (A) the laws and practices of Islam, “the straight path”.

sharif (pl. shurafa, ashraf) someone who is distinguished or highborn; Turkish provincial ruler; descendant of the Prophet Muhammad.

shaykh (A) a tribal leader, scholar, or elderly man.

silsila (A) “chain”; lineage, chain of spiritual descent.

Sufi (A) Muslim mystic.

Sufism Islamic mysticism.

sunnet (T) ritual circumcision; more broadly, from the Arabic sunna, the practices derived from the Prophet Muhammad’s example.

Sunni (A) a Muslim who belongs to the majority Muslim community (as distinct from the Shi’a) which accepts the authority and validity of the actions of the early Muslim community and its jurists.

sura (A, T sure) a chapter of the Qur’an.

surgun (T) deportation.

tabaqat (A) lit. “classes” or “generations”; Islamic biographical literature.

Tabaski (West African) annual festival, involving the slaughter of sheep, coinciding with the hajj season.

ta‘a (A) obedience.

tafsir (A) Qur’anic commentary.

tajdid (A) religious reform and renewal.

talab al-‘ilm (A) the seeking of religious knowledge, mainly through travel.

talib (A) a (religious) student or scholar; talip (T) followers or clients of a holy man, e.g. dede or pir.

taqiyya (A) dissimulation of one’s religion (in the face of a perceived threat).

tariqa (A, pl. turuq, T tarikat) Sufi brotherhood or order.

tasawwuf (A) Islamic mysticism; Sufism; the Sufi way of life.

tek (T) single, singleness.

Tijaniyya (A) a North African Sufi order.

toyol (Malay) a type of spirit believed to come from Malaysia via the hajj.

tun tigi (Manding) hereditary category of Dyula Muslims who participated in lo initiation society rituals and who were not expected to conform rigorously to the strictures of the shari‘a; see also mory.

umma (A) the Islamic community.

‘umra (A), umre hac (T) “minor” pilgrimage to Mecca at any time of year. Often understood in Turkey as a commemorative pilgrimage made after the hajj.

vatan (T, from the Arabic watan) fatherland, homeland.

Wahhabiyya (A) an Islamic reform movement founded in the Arabian Peninsula by Ibn ‘Abd al-Wahhab in the eighteenth century. More properly known as al-Muwahhidun, or “the Unitarians”; Wahhabi, a follower of this movement. Also used loosely to denote a strict fundamentalist.

wali (A) saint.

yerli (T) native, indigenous.

yeshivot (Hebrew, sing, yeshiva) Jewish schools of higher religious instruction and learning.

yolculuk (T) travel, journey.

zaddik (H, from the Arabic sadiq) Jewish saint.

zahidin (A) ascetics.

za ’ir (A) a visitor; a pilgrim who visits a shrine.

zat (T, from the Arabic dhat) personality, individual essence or substance.

zawiya (A) shrine, usually associated with a saint’s tomb.

ziyara (A, T ziyaret) a visit or voluntary pilgrimage; a shrine.

Zweite Generation (German) second generation.

[101] Abbreviations: (A) = Arabic; (T) = Turkish; (P) = Persian.

** Preface

THIS IS A BOOK about how to think about “Muslim politics.” A vast amount of literature exists on Islam and politics, and from different perspectives we ourselves have contributed to it. Drawing on that literature, we seek to clarify the meanings of such concepts as tradition, authority, ethnicity, protest, and symbolic space that are inescapably part of the professional inheritance of our disciplines—anthropology and political science—but which often recede into the background of ethnographic or political case studies.

It is thus not a book about the Islamic revival, nor is it a handbook to the politics of individual Muslim societies, much less to the politics of the Middle East. Rather, this book is intended to pose questions about the nature of one kind of politics—similar to but not synonymous with what Michael Mann (1986) calls “ideological politics”—in a variety of regional settings. In the elaboration of such a broadly comparative essay, conventional wisdom will inevitably appear suspect; and fixed, paradigmatic ways of thinking, misleading if not also dangerous.

The term “Muslim politics” is not meant to imply a concentration on self-ascribed religious authorities. The traditionally educated scholars Culama) clearly play a role, but so, too, do lay intellectuals, mothers, government leaders, and musicians. They are the protagonists of the Muslim political drama, not merely because they share normative codes but because they invoke the symbols of those codes to reconfigure the boundaries of civic debate and public life. It is these symbolic politics that account for why political actions and choices are recognizably Muslim, and in this sense “Islam” makes a difference in configuring the politics of a broad swath of the world.

Yet doctrine, it will be apparent, is of secondary importance. Muslim politics is not predetermined by a template of ideas; it is influenced by a number of factors, which, while including scripturally defined precepts, also include national identities, economic circumstances, and social status. The politics we seek to elucidate possesses a similar profile and parallel functions among both Sunnis and Shi’a, and it follows that the presumption of an engrained sectarian divergence obscures the workings of complex, but common, processes.

Also unhelpful are the customary dichotomies of social analysis— public and private, internal and external, high and low politics. Our intention is not to subvert common sense but to indicate the ways in which such unnuanced sets of contrasting markers deter awareness of the constant interpenetration of social and political networks in the Muslim world. The multiple roles of women may be hidden under the rubric “private,” much as transnational concerns over the condition of a Muslim minority may be minimized in viewing the matter as “internal” to one society.

Much of what follows will appear familiar, and in the recognition of the similarity of form and process that Muslim politics shares with other religious traditions, Islam’s putative uniqueness may be diminished. Islam is neither especially religio-political, nor particularly hostile to ethnic and cultural variations. It is neither unprecedentedly revolutionary, nor abnormally resistant to nationalism. Such demystification of Islam will simultaneously afford —for both academics and policymakers—more subtle understandings of Muslim politics and less alarmist views of an “Islamic threat.”

Any book that draws upon materials in Arabic, Bangla, Malay, Persian, Turkish, and Urdu, among other languages, poses considerable problems of transliteration, especially as we must incorporate colloquial as well as literary usages. With as much consistency as possible, we use the system for consonants adopted by the International Journal of Middle East Studies for Arabic, Persian, and Turkish. Diacritics are omitted, but we use ^e to represent the ‘ayn, as in da’wa, and ’ to represent the hamza, as in Qur’an. We drop the terminal hamza from words such as ‘ulama. The plural of words in languages that have “broken” plurals is formed by adding an “s” to the singular, except in cases such as ‘ulama, in which the transliterated plural form has become standard. When

persons or writers are known to have a preferred spelling of their name in a European language, we generally use this form.

We are grateful to a number of people who have helped us with the preparation and production of this book. Christine Eickelman, Deborah Hodges, and Moorhead Wright commented on all or parts of the manuscript. Tamara Chalabi, Sophie Claudet, Jeneen DiBenedetto, Jane Langdell, and Riva Richmond were our assistants at various points in the past several years and facilitated our research and the preparation of the manuscript. Nancy Fenton provided efficient cartographic assistance, and Lesley Yorke copyedited the manuscript with unusual care and sensitivity. Brigadier Malcolm Dennison, Her Majesty's Lord Lieutenant of Orkney, offered us an exceptional working environment on several occasions, access to an impressive personal library, and steady encouragement.

We are also happy to acknowledge the generosity of the Claire Garber Goodman Fund for the Anthropological Study of Human Culture at Dartmouth College. This grant made it possible for coauthors to bridge the distance between New England and Wales. The Vice-Principal's Research Fund of the University of Wales, Aberystwyth, provided further travel assistance.

** 1. What is Muslim Politics?

IN FRANCE in 1989, a controversy erupted over female students wearing the traditional Muslim headscarf in public schools. Five girls who insisted on wearing them were barred from attending classes. "By nature," the school principal argued, "the scarf was a sign of proselytism and exercised pressure on other Moslem girls who did not wear scarves" (Cody 1989; David 1992). By law, public schooling in France has been secular since 1905, yet the families of the girls argued that their beliefs made the practice of "Islamic" dress obligatory. After nationwide public controversy, the Conseil d'État (Council of State), the country's highest administrative body, resolved that headscarves could be worn as long as there was no pressure exercised on other students to do so. Each school could decide whether the wearing of the headscarf was disruptive. But the government was so concerned about the larger question of Muslim integration into French life that— in part as a result of this incident —it formally, though perhaps only outwardly, adjusted state policy by creating pertinent public agencies. In 1989, it formed the Conseil de Réflexion sur l'Islam en France (Advisory Council on Islam in France), and in March 1990 it created a separate committee to combat racism.[1]

Many French saw the wearing of the headscarf as a direct challenge to French national values, and so the controversy continued to simmer. In November 1993, eight months after a change of government, the principal of a primary school in the eastern French town of Nantua suspended four Muslim girls of Turkish and Moroccan origin for wearing headscarves. The local Turkish imam, who had only arrived from Germany two weeks previously and did not speak French, declared that “God’s law takes precedence over French law” (Guigon 1993). The Ministry of the Interior deported the imam, and Le Monde reported that the “silent majority” of moderate Turks in Nantua and neighboring towns, where they constituted 25 percent of the population, were “pleased” with the expulsion because it would ease local tensions (Guigon 1993). On September 10, 1994, the French Minister of National Education, François Bayrou, sharpened the controversy in a circular instructing school officials to ban distinctly religious clothing (Bayrou 1994). By early November, however, the vice-president of the Conseil d’État responded that the September circular from the Minister of Education had no legal force, so that school directors could continue, as the Conseil advised in 1989, “to make their own decisions” (“Express politique” 1994).[2] According to one poll, 86 percent of French were against authorizing wearing of the headscarf at schools. Nonetheless, the Conseil d’État upheld the right of students to do so. In late 1993, a conservative government, antagonistic to the idea of multiculturalism and concerned about integration of Muslims into French life, encouraged school authorities to adopt restrictive dress codes that would ban the headscarf in schools.

Similarly in Egypt, veiling has taken on political significance. Although Egypt is a state with a Muslim majority that has led Muslim opinion worldwide, in the late 1980s, the Egyptian authorities came to regard veiling as an act of defiance against the largely secular ideology that they wished to promote. Accordingly, they barred Muslim women with veils or headscarves from university precincts. In the mid-1990s, officials at some Egyptian universities continued to ban female students and professors from wearing niqab, which covers all of a woman’s body, including her face. Defending use of the veil, some religious leaders answered that forcing women to unveil weakens them and leads to immorality (‹Isa 1992; see also, Hedges 1993). It is worth recalling that Egyptian women were legally obliged to unveil in 1923, although the law has rarely been enforced (Guindi 1981; Ayubi 1991:241).

Both the French and Egyptian examples illustrate “Muslim politics.” Veiling is not inherently a political act, but, rather it becomes one when it is transformed into a public symbol. A dialectical relationship between individuals and the government assures this production. Women don the veil for a variety of reasons and in spite of the government’s desires, and the government’s responses to the veiling further ensure that it is no longer a private, inconsequential act. A symbol has been created and now is integral to the identity and aspirations of groups of like-minded individuals as well as to the self-defined mission of the authorities. These examples, then, are political in part because they involve challenges to the limits of state authority but also because they involve a contest over people’s understandings of and wishes for social order. The examples are Muslim because they relate to a widely shared, although not doctrinally

defined, tradition of ideas and practice. As we shall see throughout this book, the forms of political contest and discourse as well as the meanings of traditions vary widely, but a constant across the Muslim world is the invocation of ideas and symbols, which Muslims in different contexts identify as “Islamic,” in support of their organized claims and counterclaims.

Muslims everywhere, both in Muslim majority countries and elsewhere, are so increasingly aware of their global presence that individuals and groups in Europe, North America, Russia, and elsewhere have a heightened consciousness of forming part of a world community and use this awareness to amplify their voice and political strength (see fig. 1). At times some Muslims resort to violence to advance their goals, as the November 1979 attack on the Grand Mosque in Mecca and the 1981 assassination of Egypt’s President Sadat indicate. Such groups in Egypt and Algeria, in particular, have continued to threaten state officials, intellectuals, journalists, and foreigners with kidnapping or assassination in the hope of forcing governments to make strategic concessions. Yet other Muslim groups in such countries as Jordan, Egypt, Pakistan, and Malaysia call for democratization, thus indicating that Muslims can use existing political systems to reflect their political views and pressure governments to reform.

Rulers, for their part, routinely invoke Islamic imagery and ideas to legitimize their rule and to defend themselves against Muslim critics. At the time of the French invasion of Egypt in 1798, Napoleon attempted to use Islamic symbolism to win indigenous support for his rule. Although the effort was unsuccessful in the end, it was not for lack of enthusiasm. His proclamation to the people of Egypt began with the standard Muslim invocation of “God, the Merciful, the Compassionate,” and he went on to say: “I worship God (may He be exalted) far more than the Mamlukes do, and respect His Prophet and Glorious Quran ... [T]he French also are sincere Muslims” (cited in Hourani 1970:30). Nearly two centuries later, shortly after the August 1990 Iraqi invasion of Kuwait, King Hussein (b. 1935, r. 1953–) addressed the Jordanian parliament. After describing U.S. plans to break up Iraq into spheres of influence, he told the deputies that “if they wanted to honor him they should call him Sharif Hussein,” a title which stressed both his descent from the Prophet and his great-grandfather’s commitment to Arab unity and protection of Islam’s holy places (Layne 1994:26–27, 37).

*** Imagining Politics

Muslim politics involves the competition and contest over both the interpretation of symbols and control of the institutions, formal and informal, that produce and sustain them. The interpretation of symbols is played out against the background of an underlying framework that, while subject to contextualized nuances, is common to Muslims throughout the world. Evolving doctrinal considerations, it should be noted, are only one factor among many that contribute to the creation of this framework. A political system, whether in the Muslim world or elsewhere, inevitably involves the management of competing, even clashing, interests. Indeed, the authoritative allocation of resources and the demarcation of boundaries are

integral to the political process, but are not the whole of it. “Who gets what, when and how” (Lasswell [1935] 1965:3) and the division between political and nonpolitical spheres of activity are only part of the larger equation. They make sense only when the dichotomizations common to political analysis— “high” and “low” politics, “public” and “private”—are qualified by a recognition of the interpenetrating networks that evolve in the social and political life of Muslims (compare Mann 1986:1–33). For example, as Chapter 4 will argue, because the family is so valued in the Muslim world, it is not surprising that, even among those not in the elite, economic and social relations are often organized around it. The religious and moral meanings invested in the family also provide a standard by which individuals may assess whether their governments and other social groups fit into the larger moral, and Islamic, order.

[[d-f-dale-f-eickelman-and-james-piscatori-muslim-po-2.png][Fig. 1. Although the Middle East is commonly considered as the “center” of the Muslim world, nearly half the world’s Muslims live in Southeast Asia. Their political significance, like that of Muslims in Europe and North America, is rapidly growing.]]

There is a tendency to put the struggle for power at the heart of politics (Morgenthau 1961:27, 39). Political scientists have long conceptualized power in this way, but a major tradition in anthropology has also seen the “command of organized force” or, in “stateless” societies, “a distribution of the command of force” as central to politics (Fortes and Evans-Pritchard 1940:14–15; compare Caton 1987). But politics, including in the Muslim world, is not simply concerned with established authority compelling obedience. As other theorists have argued, politics may have as much, if not more, to do with bargaining among several forces or contending groups as with compulsion. Gibbins (1989: 5–6) points out that conservative philosophers such as Wittgenstein and Oakeshott conceptualize politics, at least implicitly, as public negotiation over the rules and discourse that morally bind the community together.

Even game and collective goods theories, influenced by the contributions of both strategists and economists, appear at first to reaffirm the need for a coercive political apparatus, but in the end, they place structured, high-stakes negotiation at the core of politics. Without the restraining and punitive hand of the state, they argue that individuals or groups are likely to remain “free riders,” concerned only with their own self-interest. Coercion is thus necessary to induce cooperation. Yet, what passes for coercion is really an urgent attempt by political authorities to persuade the citizen to forego selfishness, with the promise that everyone else will be required to make a similar sacrifice (Stein 1990:32–36).[3] Although game and collective goods theories can be faulted for placing too great an emphasis on the rationality of members of society, they illuminate how political authorities must cajole and bargain, as well as suppress and punish.

Societies, whether European industrial democracies, Third World developing countries, or bedouin tribal communities, are comprised of an often complex balance of forces. These

forces may take the form of political parties and labor unions, or of military and professional associations, ethnic and religious minorities, and prominent families. While it is true that the highest decision-making body—a parliament, oligarchic elite, ruling junta, or tribal council—often imposes its will and enforces decisions on subordinates, the use of force may sometimes be counterproductive, risking greater instability than is already present. For the sake of collective order, authorities must often mediate differences among various groups in society. They may even find themselves in the position of needing to negotiate social, economic, or political policy with ostensibly subordinate groups (see Soysal 1994).

The French response to the headscarf dispute indicates the shortcomings of assuming that politics can be reduced to the use of legitimate force or the allocation of material "interests." Had the government in 1989 defined the wearing of the headscarf as a challenge to the legal principle of secular education, it would have run the risk of precipitating a major domestic crisis. Muslims constitute over 5 percent (some 4 million persons) of France's population (Chirac 1995; also see Kepel 1987:13). They do not constitute a cohesive political bloc, and the majority of French Muslims did not support demands for the wearing of the headscarf at school. However, the demands of a vocal minority precipitated a political problem for the majority of Muslims in France as well as for the state. Some Muslims saw this debate as the catalyst for the vigorous enforcement of French immigration policies that followed. French policymakers, moreover, saw their response to the headscarf issue as potentially threatening France's relations with some Muslim states: A ban could have affected adversely France's international relations. At home, the government's response brought about a confrontation with a significant number of French Muslims, and it may have intensified debates, fostered by right-wing nationalists such as Jean-Marie Le Pen, as to whether Muslims can be fully integrated into French society.

The fact that the succeeding French government took a more confrontational approach in 1993 does not mean that the fear of adverse reaction, at home and abroad, was without substance. Rather, Muslim protest, including violent protest, at what are regarded as officially tolerated inequities and injustices has not been absent in France, and all governments have had to recognize the limits of confrontation. In Turkey, Indonesia, Britain, and Germany, authorities have reacted very differently to the politically and religiously charged issue of wearing headscarves or veils. In each of these cases, the outcome has usually been a face-saving compromise and an absence of "definitive" rulings to forestall direct challenges to the limits of state authority. In all cases, the headscarf issue exemplifies the struggle to control and interpret symbols integral to Muslim politics.

Political interests, whether of the state or other groups, can never be defined as solely material. As Max Weber points out, socially defined values play an important role in formulating the identities and goals of individuals and collectivities: "As a separate structure, a political community can be said to exist only if, and in so far as, a community constitutes more than an 'economic group'; or, in other words, in so far as it possesses value systems ordering matters other than the directly economic disposition of goods and services" (Weber 1968:902). These values, constitutive of a political community, are expressed in symbolic forms.

Symbols are signs that point to values, and often—although not always—these symbols are expressed in language. Sometimes they are expressed in images as well as language. The interconnection of values, symbols, and languages has a powerful effect: “Jointly shared symbolic expressions which are articulated through languages are the means of socialization and create a social bond between individuals and groups, since the roles and social relations available in society are transmitted through language” (Pekonen 1989:132).

The idea of politics as centered on power relations and “interests” alone clearly does not take account of cooperative relations among individuals in a society or between societies that are based on what they think is right, just, or religiously ordained (Cerny 1990: 17–18). Kyösti Pekonen’s definition of politics as “a struggle about people’s imaginations” (Pekonen 1989:132) is a corrective to some conventional thinking. More broadly, politics can be conceived as competition and struggle over the meanings of symbols (for example, Geertz 1973:193–233) and control of the institutions that define and articulate social values. As Immanuel Wallerstein argues, power resides not only in the possession of economic resources but also “in the control of cultural institutions” (Wallerstein 1983:34). Politics as Leviathan is thus transformed into politics as symbol maker.

In this regard, David Easton’s (1965:50) definition of politics as “the authoritative allocation of values” is unhelpful because the qualifier “authoritative” overstates the extent to which a consensus on values exists, and “allocation” overstates the degree to which consensus is maintained from above. Clive Kessler’s analysis of politics in Malaysia illustrates how values are not simply allocated and how state control of symbolic power is not always unchallenged. Values and symbols acquire focal political significance in ways that are not always predictable: “The symbolic is not a residual dimension of purportedly real politics; still less is it an insubstantial screen upon which real issues are cast in pale and passive form. The symbolic is real politics, articulated in a special and often most powerful way” (Kessler 1978:244–45).

Symbolism in politics may reduce spatial separations or emphasize temporal connections. In September 1993, Palestinians in Khartoum who were connected with Hamas (Harakat al-Muqawama al-Islamiyya), the Palestine-based Islamic resistance movement, protested against the accord between the Palestine Liberation Organization (PLO) and Israel over the Gaza strip and Jericho. Their protest, in a main public square, centered around a scale model of Jerusalem’s Dome of the Rock. This symbolism affirmed that any agreement had to take into account the views of Palestinians in the diaspora, such as themselves, and had to be based on the liberation of all Palestinian land, including Jerusalem (BBC SWB ME/1796 MED/6, September 17, 1993). On December 16, 1994, the seventh anniversary of the founding of Hamas, members of the group in Gaza, which several months earlier had kidnapped an Israeli soldier, reenacted before a crowd of thousands the Israeli raid in which the hostage was killed. The public performance, which dramatized the threat of further action, visibly reaffirmed the continuity of the struggle.

The cult that is rapidly developing around the tomb of Ayatullah Khomeini in Iran illustrates how symbolic politics “become real.” After Khomeini’s death on June 3, 1989, Iranians and other Shi‹i Muslims began to regard his tomb at the Behesht-e Zahra cemetery south of Tehran as a place of pilgrimage (ziyara) nearly equal in importance to the tombs of the twelve Shi‹i Imams. According to the Islamic Republic News Agency (“Frenzy of Grief”, 1990), “more than eight million” pilgrims from South Asia, the Soviet Union, and Iran assembled at the cemetery in 1990 on the first anniversary of the Ayatullah’s death. In addition to the traditional expressions of mourning, pilgrims shouted political slogans such as “Death to America” (marg bar Amrika). They also used the occasion to acclaim Khomeini’s successor, Ayatullah ‹Ali Khamene›i (b. 1940), the “guide” (mawlay) of the revolution .

Visits to the tomb had become so popular by the second anniversary of Khomeini’s death that the occasion was transformed into a national political rally.[4] Iran’s president, ‹Ali Akbar Hashemi Rafsanjani (b. 1934), invoked Khomeini’s calls for Islamic unity and warned Iranians that the achievements of the revolution would be endangered if they became politically divided. Ayatullah Khamene›i, for his part, addressed foreign-policy aspects of the Islamic movement (BBC SWB, ME/1090/A10, June 5, 1991, and ME/1091/A4, June 6, 1991). He indicated that he was in ill health but “could not stop myself from being with you on such a day and in such a gathering.” In September 1993, Ayatollah Khomeini’s son, Ahmad, used the occasion of a Revolutionary Guards ceremony at his father’s tomb to denounce the “shameful treachery” of the Israeli-PLO accord (BBC SWB ME/1796 MED/18, September 17, 1993). The tomb has been invested with such central political significance that, contrary to what might have seemed appropriate in light of the late Khomeini’s asceticism, green Italian marble now adorns it.[5]

As this example suggests, the symbolic component of politics is especially significant because it can be used as an instrument of persuasion as well as coercion. Bargaining models of politics suggest that persuasion, rather than force, is increasingly considered to be the basis of politics. Steven C. Caton makes this point in the context of Middle Eastern tribal settings: “[W]hen one examines the ethnographic record to determine what it is that Middle Eastern tribesmen are doing in political acts, one finds that they are talking to each other probably more than they are fighting ... with the consequent or attendant belief that the basis of power is persuasion rather than the exercise of force” (1987:89; emphasis in original).

*** The Language of Politics

In the case of Muslim societies, like others, persuasion is largely an act of speech, and the symbolic and persuasive dimension to politics has become virtually synonymous with the politics of language. It is now commonplace to argue that language is a social and political practice, and that the way we use language is intimately related to how we construct

communal identities and promote and defend our aspirations (for example, Shapiro 1984:8; Habermas 1981:397). Never neutral in itself, language may be used to affirm or reaffirm hierarchies of power. In the world of psychiatric care, for example, psychiatrists grow “angry,” but patients become “aggressive”; nurses “daydream,” but the hospitalized “withdraw” (Edelman 1984:49). Language may also be used to subvert existing hierarchies, as when Margaret Thatcher, both in opposition and in office, undermined the postwar social welfare consensus in Britain by identifying “freedom” and “efficiency” with the free market; the public sector was “tyrannical” and “inefficient” (Kellner 1988). Finally, language can take on unintended meanings, leading to unforeseen consequences. For example, the concept of “people’s democracies” in the former Eastern bloc was a thinly disguised attempt to endow a form of legitimacy on dynastic and oneparty tyrannies. Yet, as conditions changed, the concept had the ironic effect of legitimizing the revolutionaries who brought down the old order.

In the case of the Muslim world, rulers such as Sadat in Egypt and Hassan II (b. 1929, r. 1961–) in Morocco have legitimized the existing political hierarchy by referring to themselves as “the President-Believer” (al-ra›is al-mu›min) and the “commander of the faithful” (amir al-mu›minin) respectively. Conversely, critics of those in power can help to delegitimize established authorities by denouncing them as “infidel” (kafir) or “ignorant [of Islam]” (jahil). Muslim activist groups in Egypt, for instance, have pronounced Egypt the “land of unbelief” (dar al-kufr) because of the “un-Islamic” ways of the government and society. Finally, as noted above, language can evade the control of those who use it and take on unanticipated connotations. When, for example, the Kuwaiti royal family sought to validate its rule by endorsing the tribal and Islamic idea of “consultation” (shura), it encouraged expectations of participatory politics. Yet the dissolution of the National Assembly in 1976 and 1986 and the postponement of elections in the immediate wake of the 1990–91 Gulf crisis frustrated these expectations and cast the regime in a harsh and critical light.

It is not an exaggeration to say, as have several scholars (for example, Vatin 1982:221–50), that “Islam” constitutes the language of politics in the Muslim world. Although multiple interpretations can exist, Islam is a relatively stable type of expression and thus constitutes a discursive but culturally specific genre of politics (Bakhtin 1981:47; compare Bayart 1991:64). As the examples cited above indicate, the Islamic vocabulary contains words of undoubted political resonance, and a review of their historical development helps to explain their durable attraction (for example, Lewis 1988). Yet it would be misleading to conclude that the political language of Islam is simply composed of terms used in a predictable manner or to see these terms as possessing uniform relevance to political and social action. Rather, Islamic political language requires a broader conceptualization.

If, as we have just indicated, Islam may be thought to constitute the language of politics, there is also a “politics of language” in the Islamic world that must be taken into account (Piscatori 1990:771–74). This added perspective points to the variable usage of language, suggesting that the utility of Islamic terminology to both rulers and opponents is enhanced in times of upheaval and stress. It also depicts an Islamic language that is more

than simply a vocabulary. In addition to socially defined words, this language is made up of both symbols and mediators—those who modify and rework the symbols in specific circumstances and for particular purposes (compare Habermas 1981:54, 70– 72, 95–96; Derrida 1974). ‹Ali Shari‹ati (1933–77) captures this point:

The language of religion, and particularly the language of the Semitic religions, in whose prophets we believe, is a symbolical language. By this we mean a language which expresses meaning through images and symbols—the most excellent and exalted of all the languages that men have ever evolved.... A simple and straightforward language, one deprived of all symbol and image, may be easier for purposes of instruction, but it has no permanence. (Shari‹ati 1979:71)

The mediators of the language of Muslim politics include traditional, madrasa-educated religious intellectuals and the increasingly prominent “new” religious intellectuals who have emerged from modern state or secular schooling, as is the case for most Muslim activists, or who have had experience with both styles of education. Shari‹ati himself exemplifies the mixing of educational styles.[6]

Saddam Hussein’s invocation of Islamic symbolism and terminology in the Gulf crisis of 1990–91 is instructive. As leader of the Arab Ba‹th Socialist Party, with its commitment to secularism and Arab socialism and its policy of repression of Islamic groups in Iraq, Saddam would have been expected to frame his appeals for support in the language of anti-imperialism rather than Islam. Yet he pointedly referred to the “infidels” of the West arrayed against him and called for jihad (holy war) to combat them. His audience was aware of his poor Islamic credentials, and there is little evidence to suggest that the invocation of such concepts automatically aroused sympathy or instinctively rallied support for him.

In fact, there was considerable feeling in much of the Muslim world that Saddam was, at best, an opportunist and, at worst, a hypocrite. However, when Western troops went to Saudi Arabia, Saddam found a receptive audience for his anti-Western and anti-Saudi rhetoric. Words such as jihad do not automatically engender social and political action, but they acquire specific meanings in the context in which they are applied. The context in this case was that “infidel” troops on Arabian soil had exposed the Saudi monarch, the “Servant of the Two Holy Places” (khadim al-haramayn), to the charge that he was consorting with the infidels and, by extension, with their “natural” allies, the Israelis. The linkages among the House of Sa‹ud, the United States, and Israel are graphically represented in figure 2, the cover of Saffah al-Sa‹udiyya [The bloodletter of Saudi Arabia] (al-Nafi‹ 1993), a multi-colored representation of a bloody dagger, with an American flag on its handle, suspended over a map of Saudi Arabia and the Arabian peninsula. A benignly smiling King Fahd (b. 1920, r. 1982–) hovers over the map, sporting a Star of David in his ‹iqal, the rope-like band that holds his headcloth (ghutra) in place.

[[d-f-dale-f-eickelman-and-james-piscatori-muslim-po-18.jpg][Fig. 2. Anti-Saudi caricatures, often sponsored by Iranian and Iraqi groups, were common prior to the 1990–91 Gulf war, but they proliferated thereafter. This is the cover of a 1993 anti-Saudi book.]]

Saddam received a sympathetic hearing when he asked why his troops should withdraw from Arab land when the Israelis continued to occupy Palestine, including Jerusalem. It was seen partly as a matter of justice, but Muslim interest in Jerusalem was also at work. Islamic tradition holds that the Prophet Muhammad was transported to Jerusalem in a “night journey” (al-isra›), and in a second journey (mi-raj), he ascended to heaven where, at the throne of Allah, he learned the proper manner of prayer. The al-Aqsa mosque, mentioned in the Qur›an (17:1), and the Dome of the Rock commemorate this special relationship between the Prophet and Jerusalem. After Mecca and Medina, it is the third holiest city of Islam, and Palestine has become one of Islam’s holy lands.

Saddam was able to draw a link between the Israeli occupation of Palestine and the supposed Western occupation of Saudi Arabia, the land containing the holy cities of Mecca and Medina where the Prophet lived and died: “Oh, Arabs, oh, Muslims and believers everywhere, this is your day to rise and defend Mecca, which is captured by the spears of the Americans and the Zionists.... Keep the foreigner away from your holy shrines” (cited in Brinkley 1990:14). The call fell on receptive ears, partly because of the unpopularity of the oil-rich Gulf monarchies, which, to many less wealthy Muslims, appeared corrupt and arrogant. The Muslim Brotherhood in Jordan, which was agitating for greater influence in the Jordanian political system, in February 1991 called on Muslims “to purge the holy land of Palestine and Najd and Hijaz [provinces of Saudi Arabia] from the Zionists and imperialists” (Milton-Edwards 1991b:98).

The rhyming slogans used in Moroccan street demonstrations, moreover, revealed popular sentiment against Saudi Arabia and the perceived linkage between Saudi Arabia and Israel. Referring to the Saudi monarch and his guardianship of the Ka‹ba, the shrine in Mecca that is the focal point of the hajj (pilgrimage), one crowd chant was “Fahd, Fahd, ya humar, ba‹ti l-Ka-ba bil-dular” [Fahd, Fahd, O donkey, you sold the Ka‹ba for a dollar]. Another slogan, invoking Iraqi missile names that possessed religious and historical resonance, affirmed that Jews and the Saudi dynasty were the common enemy: “Al--Abbas li-lyahud, wa-l-Husayn li-s-Sa‹ud” [The ‹Abbas (missile) to the Jews, and the Husayn to the (house of) Sa‹ud]. Even among Muslims in China, some believed that the dispatch of Western troops was the latest sign of the Saudi regime’s un-Islamic character (Gladney 1994b:686).

When Saddam said that the Saudis, by allowing Western troops on their soil, were effectively in league with the Israelis, he drew together powerfully related symbols of Muslim politics: the sanctity of the two Muslim holy lands of Arabia and Palestine and Saddam, the new Saladin, as the restorer of Islamic rule over these sacred places.[7] Many Muslims responded

to Iraqi rhetoric in part because the direct intrusion of Western forces to Arabia seemed threatening to Islam. They also responded because their affiliation with institutions and groups, such as the Muslim Brotherhood and other voluntary religious associations, helped to articulate and heighten the potency of the symbolism at a time when their governments were often constrained to adopt ambiguously pro-Western positions.

As the second Gulf War suggests, Muslim politics becomes incomprehensible if the symbolism and shared assumptions of Muslims are disregarded. There is an implicit consciousness of common notions— an underlying framework of language, ideas, and values which, while not always self-evident or explicitly expressed, becomes apparent when the shared assumptions are violated or attacked. A striking feature of the Rushdie affair, in which Ayatullah Khomeini condemned a British novelist to death in 1989 for having written a "blasphemous" novel, was the near unanimity of outrage at the perceived defamation of the Prophet among Muslims of widely varying backgrounds and political opinion. Similarly, as we have pointed out, state authorities in Algeria, Indonesia, Turkey, China, Egypt, France, the Soviet Union, and elsewhere have inadvertently stimulated Muslim self-consciousness by disregarding sensitivity on issues such as marriage rites and the use of headscarves in public.

*** Doctrine and Political Action

Doctrine plays a part in such reactions but is not decisive by itself. When we say that politics is "Muslim," we do not mean to imply that doctrine invariably motivates action. Indeed, there are two reasons why the relationship between doctrine and practice is more complicated. First, the permanence of doctrine itself is a conceptual fiction. Established religious hierarchies, wishing to promote their own interests as "defenders of the faith," suggest that divinely inspired or sanctioned principles are by nature fixed and universally applicable. However, like all religious traditions, Islamic principles must be constantly reinterpreted. The result is a flexibility of ideas and divergence over time and space. As Brinkley Messick says of the distinction between the divinely ordained shari-a and interpretations of it: "In this gap between divine plan and human understanding [lies] the perennially fertile space of critique, the locus of an entire politics located in the idiom of the shari‹a" (1993:17).

The Islamic notion of zakat (almsgiving) is an example. There is little agreement other than using it for humanitarian or charitable purposes: The Qur›an encourages Muslims to spend their mal (wealth) "out of love for Him, for your kin, for the needy, for the wayfarer, for those who ask, and for the ransom of slaves" (2:177). Some Muslims argue that it is a voluntary act of faith; others argue that it is obligatory. Some contend that it is to be collected by the central government, as in Pakistan, where it was instituted along with the Islamic punishments of flogging and the amputation of limbs to bolster the regime's legitimacy through its commitment to "Islamization" (Novossyolov 1993). Islamic associations such as the Muslim Brotherhood in Egypt

sometimes levy zakat on their members (Mitchell 1969:275). An indication of the degree to which doctrine is malleable is the specific political use of zakat in a resolution of the Organization of the Islamic Conference (1981:699). It endorses the collection of zakat to support the work of the Palestine Liberation Organization, rather than, for example, to support Palestinian widows, orphans, and refugees as might be expected. In the West Bank, Hamas receives money from zakat committees to support its poorer members and social welfare activities. The expenditures strengthen support for the movement (Milton-Edwards 1991a:278).

Similarly, doctrine proves to be flexible in the case of waqfs (pious endowments). The protests of some ‹ulama notwithstanding, the Pakistani state, like many governments elsewhere, has appropriated to itself the administration of the endowments, thereby enhancing its identification with Islam. It effectively creates a state monopoly over the doctrine and its interpretation (Malik 1990).

Doctrinal change, like all change, is complex and is often tied to rearrangements in political structures (see Cerny 1990:4). Moreover, actors always have alternative political visions available and the need to articulate them. An important component, therefore, of understanding politics is the recognition of the ways in which these different, oppositional visions alter or replace currently dominant and authoritative ones. Assertions that credos, beliefs, or traditions are timeless and immemorial should not obscure the fact that they are subject to constant modification and change.

The second reason why the relationship between doctrine and practice is complex is that doctrinal prescriptions are but one factor in motivating social action (see Eickelman and Piscatori 1990:6–15). As traditional Muslim theorists maintain, ideas such as zakat and jihad play a role in inspiring social and political conduct. However, considerations such as family, ethnicity, class, gender, and bureaucratic access can be equally important. Doctrine enjoins the pilgrimage to Mecca on all believers able to do so, but believers are just as likely to fulfill this obligation because of the opportunity to improve their social status, commercial possibilities, or, in the case of Saddam Hussein, political influence.

*** Setting Boundaries

In the process of articulating symbolic politics, various forces seek to draw lines between public and private, government and civil society, obligatory and forbidden, moral and immoral. The drawing of boundaries is part of the political process, whether it involves the demarcation of decision-making units in society and the enforceable rules for resolving jurisdictional disputes among them (compare Deutsch 1966:254–55), or demarcation of areas open to state control over the production of dominant values and those that are not. Indeed, a political system has often been thought to reflect a relatively stable and

hierarchical consensus on boundary setting, but in fact challenges to this consensus and the desire to shift boundaries have always been present (Eisenstadt 1986:30–31). Immigration, for example, is a political question because it involves drawing lines around “the club” of a society or nation-state, with membership in the club a necessary component of political success. Yet, as the Muslim migration to western Europe and the rise of neofascist movements there indicate, these lines are increasingly contested because of the growing mobility of peoples and the diminished social welfare capabilities of governments.

While conservatives and neoconservatives find support for their views on limiting immigration in demarcational politics, liberals also view politics as the drawing of necessary boundaries between areas of activity, for instance, separating military from civil authority. The blurring of lines produces uncertainty and opportunities for abuse of power, whereas boundary setting is a guarantee of liberty: The state “has a special influence, for it is the agent of separation and the defender ... of the social map. It is not so much a night watchman protecting individuals from coercion and physical assault as it is the builder and guardian of the walls, protecting churches, universities, families, and so on from tyrannical interference” (Walzer 1984:327; compare Walzer 1983).

Boundary setting is important, though not exclusively so, in Muslim politics. Political scientists have often focused on the state’s role in setting down markers, but an examination of Muslim politics indicates that this “top-down” view is distorting. Boundaries can also be set by religious authorities, Islamist protest movements, and kin groups, among others. For instance, the religious authorities (‹ulama) in Egypt vigorously protested against President Sadat’s effort in 1979 to liberalize family law and women’s marital rights because they saw this as an intrusion on their authority. Similarly, Indonesia’s usually compliant ‹ulama, who have accepted pançasila, the secular national ideology, reacted strongly to the government’s attempt to implement a marriage law that would have departed significantly from Islamic family law. In the early 1990s, Muslim activist groups in Algeria were locked in a struggle with the socialist and secular government over the limits of state control of society: Should the government build state-run schools and mosques, or should it distribute the funds to various Muslim associations so they could build and maintain their own institutions?

In revolutionary Iran, disputes over boundaries have been endemic. The Majlis-i Shura-ye Islami (National Assembly) and Council of Guardians have competed with each other to set the legislative agenda, and each has warily regarded the power of the supreme faqih (literally “jurisprudent,” or leader of the revolution). The issue of land reform has proven particularly contentious. Leading Shi‹i clerics, themselves often landowners, have tended to uphold the sanctity of private property, while younger mullahs and radical groups have agitated for large-scale expropriation and redistribution of lands. A land reform measure, which was approved by the Revolutionary Council in April 1980 and which required the breakup of a large number of estates, met with a fierce opposition. As a result, Ayatullah Khomeini halted the redistribution of these lands in October 1980. Cognizant of the depth of this dispute, the then-speaker of the Majlis, Hashemi Rafsanjani, himself a supporter of land reform because he felt that it would

stabilize the social order, sought Ayatullah Khomeini's guidance in October 1981. Preferring ambiguity to favoring one faction over another in this dispute, Khomeini failed to intervene decisively. Two bills were introduced, both purportedly representing his intentions. Although an Agrarian Reform Law favorable to landlords was finally approved in December 1982, even this was rejected in January 1983 by the Council of Guardians, which is composed of senior religious scholars and which unanimously ruled that the proposed law violated "the principles of the sharia" (Schirazi 1993:204; see also, Baktiari in press).

Pressed again by Rafsanjani in early 1983, Ayatullah Khomeini suggested that if the Majlis wished to impress upon the Council of Guardians the urgency of reform measures, it should approve them by a twothirds majority. The parliament proceeded to pass laws on privately owned urban land and landlord-tenant relations by such a majority, but not before it had taken some of the Council's reservations into consideration. For its part, the Council "continued to regard itself as the final authority on questions of Islamic law—a position upheld by the constitution, affirmed repeatedly by Khomeini himself, and conceded on several occasions by the speaker of parliament (Bakhash 1985:19; see also, Bakhash 1990). A land redistribution bill was narrowly approved in October 1986, and the fact that it was allowed to stand indicates a relative shift in favor of factions that were demanding greater and faster change (Baktiari in press). But this dispute, as with others over banking, taxation, and cultural issues, remained unresolved, and the Ayatullah was eventually impelled to create a new institution, the High Council for the Discernment of Interests, which was ostensibly to act as his eyes and ears and resolve disagreements over fundamental issues that would endanger the revolution (Schirazi 1993:171–232).

The Council did not end the legislative confusion, however. As a letter to Khomeini signed by more than ninety Majlis deputies in late 1988 makes clear, there was ambiguity concerning its proper place in the system. The Majlis feared that the Council was becoming a rival legislative body that would "cause the proliferation of numerous contradictions in the laws of the country," thereby stimulating systemic instability. Khomeini's response was characteristically Delphic: telling the deputies they were "absolutely right," but noting that because of the prolonged war with Iraq (September 1980–August 1988), "the interests of Islam and the system [had] necessitated that the blind knots of law be speedily unraveled for the benefit of the people and Islam" (Foreign Broadcast Information Service [FBIS], NES-88–237, December 9, 1988, pp. 42–43). That Khomeini did not provide concrete guidance for the future only guaranteed that much of Iranian politics would center on the definition of institutional boundaries.

Muslim politics, like politics everywhere, thus involves a contest over the extent of state control—locating the boundaries of legitimate state and nonstate activity or what has been unhelpfully termed the "public" and "private." But, as Chapter 3 will argue, boundaries are also negotiated between and among nonstate actors, such as those between the religious scholars and mystical (Sufi) shaykhs. Moreover, as Chapter 4 will suggest, the boundaries between public and private are constantly shifting; family concerns can also have a "public" dimension. A notable consequence of this more diffuse process of boundary

setting, in which various individuals and groups compete to represent the claims of Muslims, is the fragmentation of authority that we will discuss in Chapter 5.

The need to place Muslim politics into multiple and shifting contexts thus becomes apparent. Like power, symbolism and language—integral components of politics—“must be located within a nexus of social and cultural relationships” (Grillo 1989:21). This need for contextualization applies to all politics, and in this respect, Muslim politics is not unique. As we have argued, neither can it be said to be unique because of any singular determination of doctrine.

The distinctiveness of Muslim politics may be said to lie rather in the specific, if evolving, values, symbols, ideas, and traditions that constitute “Islam.” These include notions of social justice and communal solidarity that have been inspired by the founding texts of Islam such as the Qur›an and the sayings (hadiths) of the Prophet. They may also include a sense of obligation to authority that has been informed as much by social practice as by Qur›anic injunction, the practices of mystical orders (tariqas), and the established schools (madhhabs) of Islamic law. Such ideas and values, as expressed through symbols and language, constitute an image of the ideal Muslim society. Precisely because the symbolism and the language are inherently flexible and even ambiguous, one Muslim’s image can be another’s “counter-image” (Kessler 1990:15). Just as those not habituated to the marketplace may have a moral ambivalence toward the “unapologetic jockeying” for material advantage that occurs in it (Geertz 1979:221), many Muslims—as the adherents of other religions regard their own faith—may prefer to think of Islam as fixed in form and content, yet implicitly, even if grudgingly, accept that its interpretations change over time. Increasingly, in the venture of Islam, Muslim politics constitutes the field on which an intricate pattern of cooperation and contest over form, practice, and interpretation takes place.

** 2. The Invention of Tradition in Muslim Politics

FROM THE MID-1950s the conventional wisdom was that Middle Eastern societies faced a stark choice—“Mecca or mechanization” (Lerner 1964:405; see also, Berger 1964, 1970:719–20, 724–27)—a phrase that epitomized modernization theory as applied to Middle Eastern and Muslim societies. The concepts underlying the phrase also governed “real world” political decisions. The late Shah of Iran was only one of many leaders of Muslim societies who tried to delegitimize the role of Islam in politics by identifying religion with the past and backwardness. Ayatullah Khomeini (1902–89) provided a measure of how other Muslim leaders reject this dichotomization:

The claim that Islam is against modern (technical) innovations is the same claim made by the deposed Mohammad Riza Pahlevi that these people [Islamic revolutionaries] want to travel with four-legged animals, and this is nothing but an idiotic accusation. For, if by

manifestations of civilization it is meant technical innovations, new products, new inventions, and advanced industrial techniques which aid in the progress of mankind, then never has Islam, or any other monotheist religion, opposed their adoption. On the contrary, Islam and the Holy Qur›an emphasize science and industry. (Khomeini [1983] n.d.:22)[8]

This unhesitant affirmation of Islam's compatibility with modernization seems even more striking, given the Western media's depiction of the Ayatullah in particular and the Iranian revolution in general as reactionary and even "medieval." The idea that Islam is a hindrance to the process of development also owes its currency to the persistence of modernization theory.

*** The "Modernization" of Muslim Societies

There have been various manifestations of modernization theory, the single most important social theory to influence both academic and policy approaches to the Third World from the 1950s to the late 1970s.

So pervasive was the impact of its early or "classical" formulation that it fashioned the aid and development policies of the industrialized Western states and such international institutions as the World Bank and International Monetary Fund. Common to all variations of this theory was the assumption that complex economic structure and political development proceed in tandem. In one influential formulation, "The forces of technological change and cultural diffusion are driving political systems in certain directions, which seem discernible and susceptible to analysis in terms of increasing levels of development" (Almond and Powell 1966:301).

Economic specialization, it was argued, leads to political institutionalization; and the displacement of traditional, usually landed, elites by urban middle classes leads to the emergence of centralized commercial, bureaucratic, and educational structures. According to this formulation of modernization theory, superstition wanes and religion recedes from a role in public life. The religious establishment comes to be seen as resistant to change. As the civic order becomes secularized, "rational" conduct becomes the norm, and this leads to greater political participation or, at the least, political stability.[9]

The secular bias of modernization theory had its specific echo in analyses of the Islamic world. In the early 1960s, modernization theorists saw the Muslim world as facing an unpalatable choice: either a "neo-Islamic totalitarianism" intent on "resurrecting the past," or a "reformist Islam" that would open "the sluice gates and [be] swamped by the deluge" (Halpern 1963:129). This intensely negative view of the possibilities of evolution in Muslim societies betrayed an inherent preference for such militantly secularizing reformers as Turkey's Mustafa Kemal Atatürk (1881–1938) and the Pahlavi shahs of Iran, Reza Shah

(1878–1944) and his son, Muhammad Reza Shah (1919–80). In the 1970s, assumptions about Islam's role in the development process continued to be similarly unnuanced: "In an industrializing nation, the gap between political and religious authority ... becomes progressively greater," whereas "Islamic influence and control are strongest when maintaining the status quo in a backward community" (Bill and Leiden 1979:69).[10]

The inherent defects of modernization theory have been well documented (for example, Higgott 1983; Binder 1986), and its limitations have become equally apparent in analyses of the Muslim world (Binder 1988:76–84; Hudson 1980:5–10). The fundamental difficulty with the theory lay in the sharp contrast between two artificial constructs, "modernity" and "tradition," and the consequent misunderstanding of the entrenched social functions of tradition. As Black observes, "If one thinks of modernization as the integration or the reintegration of societies on the basis of new principles, one must also think of it as involving the disintegration of traditional societies (1966:27)." "Modernity" was seen as an "enlargement of human freedoms" and an "enhancement of the range of choices" as people began to "take charge" of themselves (Madan 1987:748). Tradition is thus devalued as implying contrary values. It is also seen as so inimical to modernization that its displacement often gives rise to violence and a political instability, "strewn with wrecks and skeletons" (Black 1966:27–28, 164–65). Since the 1980s, several modernization theorists have come to accept that positing a sharp division between tradition and modernity oversimplifies a complex process of interaction in which religion and tradition coexist with economic development and the needs of a modern society (for example, Weiner and Huntington 1987).

In many ways, Marxist-Leninist theories of development and modernization theories evolved similarly. Just as the 1979 Iranian revolution helped to trigger a rethinking of modernization theory in the West, it had similar repercussions in the Soviet Union, where scholars and policymakers worked largely in isolation from their Western counterparts.[11] The Islamic revolution in Iran and the rise of Islamic political activism as a force in world politics could not be explained by conventional Soviet frameworks. Soviet thinking was conditioned by the Marxist-Leninist assumptions that religion belonged to an ideational superstructure that was destined to disappear with the social and economic formations that supported it. As Mikhail Piotrovsky of the Hermitage, St. Petersburg, commented in 1990, "Twenty years ago we considered religious beliefs to be dying. Now we are reaping the harvest of this neglect" (cited in Eickelman and Pasha 1991:632).

Many Marxian (those broadly influenced by Marxist traditions), socialist, and leftist writers, however, persist in seeing politics in the Middle East and elsewhere as governed by a "neopatriarchal" petit bourgeoisie defined by and supportive of traditional values. The neopatriarchal elite, in such a view, stands in contrast to a bourgeois elite intent on modernization and a proletarian elite committed to revolution (Sharabi 1988:8–9). The problem is thought to lie with cultural schizophrenia, yet the oversimplified dichotomization of tradition and modernity is again evident:

The neopatriarchal ruling classes and states of the Middle East are Janusfaced because they look both backwards and forwards, towards tradition and modernity. They are dualistic because they are neither totally developmentalist nor completely pre-capitalist and pre-industrial. This is why no Middle Eastern country has produced manufactures on the level of South Korea, Brazil, Mexico, the Philippines or Thailand ... and why there is so much oscillation and vacillation in the region, especially over the woman question. (Moghadam 1991:206)

Hisham Sharabi presents a subtle discussion of patriarchal and neopatriarchal societies, which develop in several stages and which consist of a number of types of social formation. Neopatriarchy is a “dependent, nonmodern socioeconomic structure” that “represents the quintessentially underdeveloped society” (Sharabi 1988:6–7). Although he argues that neopatriarchy will not be replaced “all at once” by “development” or “modernization,” he implicitly affirms a dichotomous approach. He refers to modernity as “a break with traditional (mythical) ways of understanding reality in favor of new (scientific) modes of thought” (1988:10), and he concludes with the hope that Arab society will “overcome its innermost disease, patriarchy, and ... become modern.... The coming of modernity, secular democracy, and libertarian socialism” would displace “the neopatriarchical status quo” (1988:155).

In contrast to the assumptions of early modernization theory and Marxist-inspired theories, tradition is often a profound vehicle for evolutionary and revolutionary change. In contemporary European usage, tradition implies procedures handed down from the past, not amenable to conscious modification, and resistant to “modernity.” In the view of one Western scholar writing in the early 1960s, tradition does little to help the Muslim to “cope with the modern world that threatens his undoing.” In fact, “to be traditional ... is to remain unrelated to modern political choices” (Halpern 1963:114–15). As we have indicated, many Middle Easterners, especially those educated in the West or influenced by Western values, also accept this pejorative notion of tradition. To them, the label “traditional” (taqlidi) implies being chained to the past and unwilling to participate in debates concerning the reform of existing social and political institutions.

Yet, as newer modernization studies have argued (So 1990:85–87), tradition need not be construed in negative terms only. Traditional family and religious networks may in fact facilitate development, and social and political changes are often made possible because they are cast in terms of the traditional framework (see Findley 1992:149). “Entrepreneurial familism” and nepotism, for example, have contributed to Hong Kong’s economic success (Wong 1988:170–71). Although it has been argued that Islam does not aid the process of modernization (Bill and Leiden 1984:67), to construct a claim that changes are Islamic is to render them legitimate and acceptable. By defending changes as in keeping with the “essence” of Islam, reformers deflate criticism that their changes run counter to the basic values of society. Likewise, by tying reforms to the fundamental responsibility of Muslims to obey God and those in authority, as enjoined in the Qur›an (for example, 4:59), they encourage the belief that innovative regulations are obligatory.

Emendations and additions to a purportedly invariant and complete Islamic law (shari-a) have occurred throughout Islamic history, particularly since the mid–nineteenth century. Muslim jurists have rigorously maintained the pious fiction that there can be no change in divinely revealed law, even as they have exercised their independent judgment (ijtihad) to create a kind of de facto legislation.[12] For instance, the nineteenth-century Ottoman reforms—the Tanzimat of 1839–76— including the Commercial Code of 1850, gave the Ottomans criminal and commercial regulations similar to those found in Europe. The Majalla of 1870, the codification of laws inspired by one of the main Islamic legal traditions, the Hanafi school of law, provided for the greater degree of regularity required in complex economic transactions, including trade with non-Muslim powers. In the twentieth century, laws governing awqaf (religious endowments), which were promulgated in Egypt (1946), Lebanon (1947), and Syria (1949), attempted to remedy the situation created by endowments that put productive land out of use and that could be designed, under the pretext of religious philanthropy, to deprive an individual’s heirs of property to which they would normally be entitled.

Even in such a reputedly conservative country as Saudi Arabia, legal reforms routinely occur, often made possible by an invocation of the “public interest” (maslaha ‹amma) as an overriding Islamic concern. To give but one example, the Social Insurance Law of 1970 is a notable departure from the classical laws of inheritance in the case of a deceased worker: Inheritors of his governmentally guaranteed insurance would now be principally his wife and children and not simply—as might be expected—male agnatic relatives (see Piscatori 1986:122–24).

So common has this social legislation become in Saudi Arabia that King Fahd opened the Jurisprudence Academy of the Organization of the Islamic Conference with a ringing defense of ijtihad as a means to find new solutions to the problems of the age:

Such Ijtihad must be validated by the Ulema [‹ulama, men of learning] after due research in and consideration of old and new jurisprudence. In this regard, the call for the establishment of [this academy] reflects an imperative need at this stage of development of the Muslim Ummah [umma, Islamic community]. Indeed, it provides the truly Islamic response to questions raised by the challenges of modern life. This requires the pooling of efforts by jurists, scholars, sages and thinkers throughout the Muslim World with a view to seeking answers to the questions posed by the challenges of our time, based on the reality of our tolerant Shariah. (Fahd 1983:5)

In so arguing, Fahd has subtly blended a reaffirmation of the need for independent reasoning with an endorsement of the role played by Muslim intellectuals and thinkers who do not belong to the cadre of traditionally educated religious authorities.

If the invocation of the traditional framework facilitates incremental change, even revolutionary action is often justified by appeal to precedent. The Sudanese Mahdi, Muhammad Ahmad (1844–85), gained considerable popular support by asserting that his strategy and daily round of activities corresponded on a day-to-day basis with what the Prophet Muhammad did in seventh-century Arabia. Such claims of an exact replication of the past are extreme, and contemporary political conduct relies on more subtle invocations of past values and practice.

A more recent case in point is the development of constitutionalism in Iran. At the time of the Constitutional Revolution (1905–11), Shaykh Fadlallah Nuri (1842–1909) objected to the idea of a written constitution, in part because it presumed to guarantee equality, which could not exist between the free man and the slave, husband and wife, Muslim and infidel, the healthy and ill. He also found the idea of a constitution unacceptable because it provided for a legislative body, which would infringe on divinely revealed law (Nuri 1982: 292–96). For him, a written constitution fell outside the acceptable Islamic framework.

Ayatullah Khomeini, although he expressed admiration for Shaykh Nuri, was nevertheless instrumental in formulating the 1979 constitution of the Islamic Republic. Notions of the limitations on the powers of government and of the central role of the people, such as expressed by Mehdi Bazargan (1905–95; r. 1979), his first prime minister, would have been known to him: “[T]he Holy Book affirms that any kind of government or vicegerency should stem from the people, and that they themselves should, having chosen and stated their preference for the kind of government in question, be the motivating force behind its enforcement and control” (Bazargan 1979:30).[13]

The preamble of the constitution, incorporating the idea that Muslims form a community based on submission to the will of God, says that the government “is a crystallization of political idealism based on religious community and concord which provide its organization—which through the process of ideological transformation turns its path toward the final goal (movement toward God).” Although the authors of the constitution thus directly affirm its Islamic credentials, they combine ideas of submission and participation. On the one hand, “the purpose of sovereignty is to make people grow toward the divine order,” while on the other, the constitution provides for “participation ... in order to perfect every person.”

The substantive clauses of the constitution display the coexistence of these two contrasting notions of sovereignty. They affirm the traditional concept of the absolute sovereignty of Allah (Principles 2 and 56), while accommodating the very different idea of popular sovereignty in conceding the people’s right to determine their own “destiny” (Principle 3:8) and allowing for occasional referenda (Principle 59) and a popularly elected assembly (Principle 62) (Iran 1980).[14]

*** The Blurring of Tradition and Modernity

Muslims and non-Muslims alike tend to take at face value the ideological claim by some Muslims that the key elements of Islamic tradition are fixed. Indeed, the idea of tradition is profoundly conditioned by the central role played by both founding texts and Prophetic example. Just as Muslims consider the Qur›an, the direct word of God, to be immutable, the hadith (sayings) and actions of the Prophet Muhammad are regarded as a template for action in the present.

All traditions are created, however, through shared practice, and they can be profoundly and consciously modified and manipulated under the guise of a return to a more legitimate earlier practice. Of even more significance, changed economic and political conditions can profoundly alter the meaning and significance of ideas, movements, social and personal identities, and institutional arrangements, without the proponents of these ideas being fully aware of the nature of the change. From Indonesia to Morocco, communities and regions assume that there is an Islamically defined continuity to their ways of doing things.

Politics, as we have shown, is intimately connected with the process of symbolic production. But, because symbols are general and ambiguous rather than specific, they simultaneously provide a link with the past and room for change (Scarritt 1972: 29). The effects of what might be called “postmodernization” can be mitigated by both this rootedness and flexibility. Since values take on symbolic form, the parameters of the culture appear to remain intact while the renewal and transformation of values are in fact taking place. Thus, the constancy of traditions and shared myths is affirmed, even while changes of belief and value are underway and traditions are reinvented (Barthes 1957:41–46; Samuel and Thompson 1990:14). In the case of the United States, for example, the reassuring mythology of the Constitution holds that it is amended only rarely. In practice, however, it is reinterpreted almost daily by myriad judicial, administrative, and legislative decisions.

In the case of Islam as well, there is scope for change, and several Islamic traditions can be found. Since the late 1970s, the Iranian Shi‹a, for whom dialogue and debate at all levels of religious awareness have always played a major role, have become conspicuously multinational. Even within Iran, the multiple languages of the Shi‹a—Persian, Azeri, Kurdish, and Arabic (both as the first acquired language for some Iranians and as a prerequisite for higher religious studies)—encourage awareness of multiple perspectives of ethics, politics, and interpretations of the past. The pilgrimage to Mecca; visits to the shrines of Shi‹i martyrs; and the rituals of birth, marriage, circumcision, and death, in exile or abroad, all give rise to a reinterpreted sense of history and what is “essential” to belief and practice (Fischer and Abedi 1990).

The sense of history and the past is never politically neutral. Edward Shils (1981:185) distinguishes between the pasts of occurred events and the “much more plastic” perceived past. Actually, because the line between occurred and perceived pasts depends upon the construction, dissemination, and acceptance of authoritative historical narratives, the past of

occurred events exists mostly as a pool of resources which can be drawn upon in traditional and modern settings to sanction present practice. In effect, the line between occurred and perceived events is inherently blurred because the process of creating tradition is both conscious and explicit, and unconscious and implicit.

The invention of tradition is the “process of formalization and ritualization, characterized by reference to the past” (Hobsbawm 1983:4–5). Invented traditions can emerge from the shared practices of extended families, neighborhoods, and tribes; they can develop more formally (as in court etiquette or merchant guilds); or they can be bureaucratically initiated and codified. Less attention has been given to a critical awareness of how such traditions—claims as to what is “really” Islamic, for example—are affected by political and economic circumstances and changing modes of transmission. Modes of transmission encompass oral, unwritten traditions passed on by local authorities as well as traditions learned from state-controlled television and official texts such as schoolbooks.

The invention of tradition occurs in all times and places, but, as Hobsbawm indicates, “We should expect it to occur more frequently when a rapid transformation of society weakens or destroys” older social patterns or produces “new ones to which they were not applicable (1983:5).” In contrast to the assumptions of both nineteenth-century liberal thought and mid–twentieth-century modernization theory, he points out that traditions are formalized in “modern” as well as “traditional” societies, again reminding us that the sharp contrast between traditional and modern is misleading.

**** From Caliphate to Islamic State

Nowhere does the tendency to justify present innovation by past practice show more clearly than in recent arguments on the nature of the Islamic state. This debate did not occur in a vacuum: It crystallized in the early twentieth century as Muslims sought an alternative to the doctrine of the caliphate in the declining Ottoman Empire (Enayat 1982:69).

The Ottoman caliphate, which had its origins in the late fourteenth century, was formally abolished by republican Turkey in 1924. At the height of Ottoman power in the sixteenth and seventeenth centuries, the title and the concept of caliphate were not greatly stressed. But when invoked, the caliphs’ claim to authority rested on their assertion that, by the will of God, they were the most effective defenders of Islam. In succeeding to the caliphate (khilafa), they had thus assumed all the powers of Muhammad except prophecy.

In the eighteenth and nineteenth centuries, as the Empire declined under increasing internal pressure and external challenges from the West, the Ottomans reinvented the caliphal tradition. In the eighteenth century, a legend developed that the last ‹Abbasid caliph in Cairo had transferred the office of caliph to the Ottomans in the early sixteenth century, thus legitimizing an unbroken succession from the time of the Prophet (Inalcik 1970:320–23). “There were obvious political reasons why Ottoman sultans of the age of decline reformulated and appropriated the classical theory of the caliphate” (Inalcik 1970:320).

The idea of the Islamic state in the twentieth century emerged as a similar reinvention of tradition. The most common word for state in Arabic, dawla, appeared as early as the mid–eighth century, when it referred to the dynastic rule of the ‹Abbasids (Lewis 1988:36; Ayalon 1987:81–82). In the twentieth century, the term was transformed into al-dawla al-islamiyya (the Islamic state), to which Muslims aspire. Like the earlier theory of the caliphate, justification for the Islamic state centers on upholding the shari-a (Islamic law).

Arab Muslim intellectuals played a major role in this process. The concept of the Islamic state was promoted as the functional equivalent of the caliphate. Abu-l-Hasan al-Mawardi’s (991–1058) treatise on the caliphate, Kitab al-ahkam al-sultaniyya [The principles of government] (1960), is regarded as the archetypal Sunni treatment of the subject. He argues that a caliph is necessary to uphold the shari-a and implement its principles; he used this argument to sustain the authority of ‹Abbasid rule in the face of attacks by local warlords in Iraq and Egypt who also claimed to be “rightful” rulers of the entire Islamic world (Watt 1968:101–2) (see fig. 3).

The Egyptian reformer, Rashid Rida (1865–1935), was an important link between classical theories of the caliphate, such as al-Mawardi’s, and twentieth-century notions of the Islamic state. Rida, harkening back to the “golden age” of Islamic governance and drawing on a wellestablished point of view in Muslim historiography, distinguished between the ideal caliphate of the first four successors to the Prophet Muhammad and the actual caliphate, which was obliged to compromise with tyrants and became tyrannical itself. Rida (1934:57–65) argued that the men of learning (‹ulama), who were charged with the responsibility for maintaining the shari-a, became corrupted through compromise with temporal authority (sulta) and consequently often lent themselves to the support of tyrants.

Rida recognized the impossibility of reviving the caliphate as the sole source of spiritual authority, but he saw the transfer of its function to the Islamic state as a practical alternative. The terms he used to describe the Islamic state, including “the government of the caliphate” (hukumat al-khilafa) and the “Islamic caliphate” (al-khilafa al-Islamiyya), stress the linkages between the theory of the caliphate and that of the Islamic state (Enayat 1982:77). In retrospect, Rida’s thought was ambiguous and paradoxical; Rosenthal goes so far as to consider his basic position “utopian and romantic”

(1965:83–85). Nonetheless, he delineated the issues common to later proponents of the Islamic state and formulated the “tradition” that this state incorporates notions of popular sovereignty and human legislation (Enayat 1982:77).[15]

Olivier Roy characterizes as “inanity” the attempt to concretize the “illusion” of the Islamic state. He bases this judgment on the intellectual bankruptcy of contemporary Islamists in facing the challenges of modern societies. He argues that they have no solutions to the dominant problems of the day—“misery, rootlessness, the crisis of values and identities, the collapse of educational systems, North-South antagonism, and the problem of the integration of immigrants in host societies” (1992:43).

Nonetheless, the invention of the tradition of the Islamic state is profoundly affecting the political processes of Muslim societies everywhere and qualifying public policy debates in them. In Egypt, critics of the regime, who range from the relatively accommodationist Muslim Brotherhood to the more uncompromising network of “Islamic Associations” (Jama‹at Islamiyya), have wondered how Egypt could presume to be Islamic if the shari-a remained only a source of law rather than its principal or sole source. The dominant Islamic group of Algeria, the Front Islamique du Salut (the Islamic Salvation Front [FIS]), participated in the December 1991 parliamentary elections and called for the transformation of the Popular and Democratic Republic of Algeria—to give the country its full formal name—to an Islamic state. The success of FIS in the first round of elections prompted the resignation of the president and precipitated a political crisis that brought the intervention of a military intensely hostile to the demands of FIS and similar groups. In the Central Asian republic of Tajikistan, the Islamic Renaissance Party, which has branches in other Central Asian republics and in Russia, became so popular after the collapse of the Soviet Union that many were concerned that Tajikistan would become the region’s first Islamic republic (Rashid 1991b).

[[d-f-dale-f-eickelman-and-james-piscatori-muslim-po-5.png][Fig. 3. The caliphate, like control over the holy places of the Arabian peninsula, implies a geographical center and territorial cohesiveness to the Muslim world. This vision is increasingly displaced by a multiplicity of political centers. Indeed, a Mecca-centric view of the world distorts the contest over Muslim politics that includes what was once thought of as “peripheral” China, Indonesia, Africa, and America.]]

The concept of the Islamic state has become so central to Muslim discourse that it has shaped the symbolic politics of Nigeria and Indonesia. In Nigeria, the government’s application in 1986 for full membership in the Organization of the Islamic Conference (OIC), the intergovernmental organization of Muslim states, precipitated riots and political protests. Muslim activists supported the application to the OIC in the hope that it would encourage the Islamization of Nigeria’s Muslim population, while Christian leaders feared that membership in the OIC would imply movement toward an Islamic state and the undermining of Nigeria’s secular pluralism (Gambari 1990:307–10). Similar sensitivities about the

development of an Islamic state have been present in Indonesia and are the result of a long history of dispute over the nature of the state in a multisectarian society with a preponderant Muslim majority (estimated at 90 percent). Although the government is officially committed to secularism and pluralism, as represented in the official ideology, the pançasila (the “five principles”), demands for an Islamic state fueled the Dar-ul Islam revolt in West Java (1948–62) and have remained high on the political agenda (Horikoshi 1975).

**** The Islamic “Golden Age”

In the view of its Muslim advocates, the Islamic state is justified by reference to the early years of Islam. They argue that the Islamic state first became an issue with the death of the Prophet. In the Prophet’s lifetime, writes one modernist, “sanctions were entirely moral, and [bore] no relation to conventional methods of state coercion” (el-Affendi 1991:21). In this view, allegiance to the Islamic state was voluntary during the Prophet’s lifetime. After his death, however, “a coercive political authority seemed indispensable.” Although the issue of leadership was resolved with “reasonable unanimity,” other issues soon led to civil war and the collapse of the “idealist state” (1991: 22–26).

Contemporary Muslims regard the period of the Prophet’s first four successors, the “rightly guided caliphs” (al-khulafa al-rashidun), as one in which there was little divergence between ideals and reality. Of these four, however, only the first, Abu Bakr (r. 632–34), died a natural death. ‹Umar ibn al-Khattab (r. 634–44) was assassinated by a Christian slave of the governor of Basra. The third, ‹Uthman ibn ‹Affan (r. 644–56), was killed and his house pillaged by rebels who regarded his rule as tyrannical. And the last of the four, ‹Ali ibn Abi Talib (r. 656–61), the Prophet’s son-in-law, was killed on his way to the mosque at a time when the Islamic community was increasingly rent by dissension.

The invocation of a golden age is especially prevalent in the thinking of Muslims whose principal aim is to certify Islam’s compatibility with the universal “goods” promised by the modern age: science, democracy, social justice, and human rights. These intellectuals, whether they call themselves modernist reformers or religious activists, have found invocation of the golden age a useful instrument with which to argue the need for reform within Muslim societies. In effect, even if the era of the rightly guided caliphs had not been preeminent in its moral instructiveness, they would have had to invent such a paradigm in order to highlight the present state of affairs and provide an unimpeachable standard by which to judge and condemn it. The early community of the Prophet and his four immediate successors was invested with the moral qualities so conspicuously missing in the subsequent centuries when bida‹ (unworthy innovations) set in. This degradation was thought to be especially evident during Umayyad (661–750) and ‹Abbasid (750–1258) rule.

The school of thought that emerged in the late nineteenth century and became known as the Salafiyya (from salaf, the ancestors of Islam) illustrates this tendency to find inspiration in the early Muslim community. One of its most important exponents, Muhammad ‹Abduh (1849–1905), argued, for example, that Muslim neglect of the common good in legal matters and rulers' emphasis on obedience above justice engendered intellectual confusion, legal stagnation, political corruption, and the decline of Islam (‹Abduh [1925] 1978:104–23). Muslim activists continue to echo this refrain in the late twentieth century.

Sadiq al-Mahdi (b. 1936; r. 1966–67, 1986–87, 1988–89), a former prime minister of Sudan and great-grandson of the Sudanese mahdi who led the nineteenth-century revolt against the British (1881–98), finds the age of the rightly guided caliphs exemplary because of their direct contact with the Prophet and the purity of the early community's faith. On the basis of his interpretation of the early Muslim community, al-Mahdi argues that "Islam produced political principles such as freedom, justice, equality, [and] the necessity of government for the people." The modern democratic order has evolved to resemble these ideas, but Muslims must seek to recapture today the essence of their own tradition "produced fifteen centuries ago" (al-Mahdi

1990:197).

Al-Mahdi's argument reminds us that political theory in the Muslim world is most concretely expressed through the representation of historical tradition. The formalization of the "golden age" tradition thus functions to provide both a powerful indictment of the waywardness of modern Muslim societies and a blueprint for action. Tradition acts, in effect, both to legitimize criticism of the status quo and to facilitate revolutionary as well as incremental changes.

**** The "Call" (Da‹wa) to Islam

The transformation that is occurring in the concept and practice of da-wa indicates how the reworking of basic Islamic concepts involves not only state elites and intellectuals but also the masses. Change is initiated from the apex of society, as it were, but also from the base. Da-wa is mentioned in the Qur›an (14:46) as God's "call" to human society to find in Islam the true religion. The term has developed over the centuries into an explicit ideology of proselytism. Never dissociated from the political and social contexts of Muslims, da-wa has been used to propagate the specific claims of dynasties such as the ‹Abbasids and sects such as the Isma‹ilis. Under the latter, in fact, the term became virtually synonymous with propaganda, and Isma‹ili missionaries (du-a) of the Cairo-based Fatimid dynasty (969–1171) became accomplished at recruiting followers to both a religious doctrine and political affiliation. Education was central

to all conceptualizations of da-wa. Whether formally at court, as with the Fatimids (Canard 1965:169), or in informal circles of scholars, Muslims as well as nonMuslims acquired through missionary work an understanding of the living faith—how to recite the Qur›an, apply the shari-a, and conduct the affairs of everyday life in an Islamic spirit.

Today this tradition of da-wa has begun to be reformulated in a subtle but important way. Education remains central, and even the pattern of politicization has recurred. For example, one of the main Shi‹i groups in Iraq opposed to the rule of Saddam Hussein (b.1937) bears the name Hizb al-Da‹wa al-Islamiyya (Islamic Call party), and one of the chief instruments for the dissemination of Libyan religious and political ideas is the Jam‹iyyat al-Da‹wa al-Islamiyya (Islamic Call Society). Yet the tradition of da-wa is also being redefined to include the idea of social welfare activism—free medical clinics, soup kitchens for the poor, subsidized housing, and other forms of mutual assistance which often substitute for ineffective or nonexistent government services. The explicit linkage with the "prior" tradition is the assertion that Muslims, obliged to follow God's call, must respond to the Qur›anic duty to create balance (mizan) and justice (‹adl, qist) in the affairs of men (16:90 and 58:25). Since Islam involves a total way of life, Muslims would abdicate their responsibility if they failed to redress social injustices and economic inequalities.

The influential Lebanese Shi‹i religious figure, Musa al-Sadr (1928– disappeared 1978), promoted a new kind of Shi‹i activism that included, among other things, the establishment of a vocational training center in Tyre, al-Mu›assa, which is still in operation (Ajami 1986:111). Hizbullah, the "party of God," has also developed an extensive social welfare system in Lebanon that involves educational, agricultural, medical, and housing assistance. In Beirut's Bir al-‹Abid quarter, it has run a supermarket cooperative, selling produce below retail costs (see Chipaux 1988; also see Piscatori 1989:30), but, more importantly, it also provides scholarships, runs health clinics, and subsidizes housing for the needy. In the United States, the American Muslim Council (1992) emphasizes the need to develop "social service institutions," and the Jama‹at Nasr al-Islam (Society for the Victory of Islam) in northern Nigeria operates health clinics and an "aid group" that functions much like the Red Cross. In Jordan, the Islamic Hospital in Amman is highly valued. In Malaysia, ABIM (Angkatan Belia Islam Malaysia), the Muslim Youth Movement of Malaysia, talks of the need for "Islamic outreach," and Darul Arqam has operated a public health clinic as well as farms and factories for the production of halal ("permitted") food, toothpaste, and soap (Anwar 1987:37). Such social welfare activities strengthen the communitarian basis of Islamic groups at the same time as they serve the groups' power-seeking strategies.

Ashfaq Ahmad, a member of the Islamic Society of Papua New Guinea, has captured the deliberateness with which this reformulation of da-wa tradition is occurring:

Da‹wah work must be supplemented with the social, cultural, and economic development of the country. A substantial amount of funds should be allocated to be spent in these countries for health, education, and better living conditions for the people living there in the form of grants, aids or loans.... The spirit of service and brotherhood should inculcate and permeate all the activities of development, so that people may appreciate the difference between this work and colonialism. (1981: 29).

Those who carry out these practices of da-wa—missionaries, health workers, educators, and engineers—may not consciously intend to transform tradition, but their activities contribute as much to the process of transformation as the formal discourse of Muslim intellectuals.

*** The Objectification of Muslim Consciousness

As we have seen, tradition is a subtle and elastic concept. It sometimes refers to the unwritten shared understandings of small-scale, relatively isolated communities, which change as they are passed from generation to generation, although these changes are hard to perceive because of the lack of fixed records of “the way things were.” Tradition can also refer to the shared understandings of extended family groups or households. The concept also encompasses major elements of world religious traditions, such as the four recognized Sunni “schools” (madhhabs) of Islamic jurisprudence. All these senses of tradition are subject to considerable flexibility as they are sustained and recreated in various social and historical contexts, ranging from the intimacies of family life to the conduct of state affairs. Notwithstanding the powerful metaphor of the great Muslim thinker Abu Hamid Muhammad alGhazali (1058–1111; n.d.:14) that the “glass” of traditional faith, once broken, cannot be mended, the view of tradition that we have presented suggests that the substance and form of tradition are flexible and subject to reinvention.

Rather than conceive of tradition and modernity as sharply dichotomous, broad-banded distinctions, it is useful to narrow our focus to the processes by which many aspects of social and political life become subject to conscious reflection, discussion, and debate. A concrete example will illustrate this point. In a provincial capital of the Sultanate of Oman in 1979, one of the authors slept in the guest room (sabla) of a major tribal leader. An hour before sunrise, the other guests, all Omanis, rose to perform their ablutions for their morning prayers. The author fell back asleep and failed to respond to a later “wake up” call. The tribal leader was summoned and asked the author whether he was sick. The author explained later that he prayed in a different way and so did not proceed to ablutions and prayers. He subsequently learned from a young Omani that it was taken for granted that the author, an Arabic-speaker who was aware of local etiquette, would follow all local practices. Omani Ibadis of the northern interior knew of course of other Muslim and non-Muslim traditions, but they were marginal to their social and moral imagination.

In the same community several years later, a much more conscious sense of tradition had begun to emerge, inspired by the growing cohort of young Omanis who had received a secondary or postsecondary school education and who, with the increasing ease of transportation and the expansion of networks of youth met through schooling, military service, and employment, began to question what it meant to be a Muslim. As one of Oman's first generation of village schoolteachers observed of the northern Oman interior, "People here do not know Islam; they pray and sacrifice, but they do not know why" (interview, Nizwa region, March 9, 1988).

Before the mid-1970s, such a consciously critical statement would have been almost incomprehensible in most of the towns and villages of Oman. It would not have occurred to most people that their practice of the faith could be brought into question. By the late 1980s, however, such questioning had become common, and what we call "objectification" had reached into all parts of the Muslim world.

Objectification is the process by which basic questions come to the fore in the consciousness of large numbers of believers: "What is my religion?" "Why is it important to my life?" and "How do my beliefs guide my conduct?" Objectification does not presuppose the notion that religion is a uniform or monolithic entity (although it is precisely that for some thinkers). These explicit, widely shared, and "objective" questions are modern queries that increasingly shape the discourse and practice of Muslims in all social classes, even as some legitimize their actions and beliefs by asserting that they advocate a return to purportedly authentic traditions. Objectification is thus transclass, and religion has become a self-contained system that its believers can describe, characterize, and distinguish from other belief systems.

Since Iran's Islamic revolution, many of Tehran's Friday sermons illustrate this tendency to present Islam as an abstract system of ideas that can be distinguished from other such systems. In these sermons, leading religious authorities explain policies, problems, and events of the week to much wider audiences than those of the Shah's time, despite the state's control over mass communications. In a sermon in June 1991, Ayatullah Muhammad Yazdi, head of the Iranian judiciary, reiterated a common theme in warning his listeners against "American-style Islam." This he defined as a "monopoly in certain types of individual worship and slogans, having nothing to do with political issues, not discussing world events, possessing some simple rituals and disregarding others.... One should be very careful [because] the danger of an American-style Islam, that is, one that says that the government has nothing to do with Islam, is far greater than that of weapons" (BBC SWB, ME/1106/A1–2, June 24, 1991).

Ayatullah Yazdi's characterization of "American-style Islam" illustrates the "objectification" of the Islamic tradition. So, however, does the "politicized" Islam which he implicitly advocates as more "authentic." Because these sermons often refer to published sources and provide arguments that invoke recognizable authorities, the implication is that the audience is

familiar with texts and the principles of citation. Not all in the audience can follow such arguments in detail, but they recognize the forms of authority. This form of argument may be even more important for religious leaders not primarily identified with traditional learning. For example, Siddiq Fadhil, one of the leaders of ABIM in Malaysia, “is not readily accepted as an ‹alim (religious scholar) by the older generation of Malays and those from the rural areas, [but] his regular and deliberate resort to quotations from the Qur›an and Sunnah in his speeches has tended to promote his image as a leader in the eyes of many Muslims” (Mutalib 1990:76)

The process we call objectification is not unique to Islam. Hefner (1985:246–65; 1987) describes it in ethnographic detail as it occurs among both Hindus and Muslims in the Tengger highlands of eastern Java, and Madan (1987) describes the implications of objectification for religion and politics in India.[16] Wilfred Cantwell Smith (1963:85), however, argues that Muslims are more likely than participants of other religious traditions to present Islam “as an organized and systematized entity.” From this perspective, “being Muslim” acquires more political significance in the modern world than participation in other religious traditions because of the self-conscious identification of believers with their religious tradition.

In assessing the implications of this heightened self-consciousness— of the systematization and explicitness of religious tradition—for political conduct, our primary focus is on how, in the late twentieth century and in certain contexts, Islam has become objectified in the consciousness of many Muslims. Three facets of objectification are noteworthy. First, distinctive to the modern era is that discourse and debate about Muslim tradition involves people on a mass scale. It also necessarily involves an awareness of other Muslim and non-Muslim traditions. Just as the sixteenth-century Christian Reformation has been aptly called “the daughter of printing” because printing made possible a broader dissemination of ideas, mass education and mass communication in the modern world facilitate an awareness of the new and unconventional. In changing the style and scale of possible discourse, they reconfigure the nature of religious thought and action and encourage debate over meaning.

Mass education and mass communication are important in all contemporary world religions. However, the full effects of mass education, especially higher education, are just beginning to be felt in much of the Muslim world. In the Middle East, for example, mass education is a relatively recent phenomenon. In Egypt, mass primary education began in earnest only after the 1952 revolution. It was another fifteen to twenty years before large numbers of students completed the advanced cycles of state-sponsored education. The timing of educational expansion varies for other parts of the Muslim world. Major educational expansion in Morocco, for instance, began in the late 1950s; it began in the early 1970s for Arabian peninsula countries such as Oman and Yemen. In Oman, a mere 32 students completed the complete cycle of secondary education by 1975–76, although this number had risen to 13,500 by 1987–88. Only in the late 1980s did a critical mass of people with postsecondary education, capable of sustaining an expanded internal market for newspapers, periodicals, and books, begin to emerge.[17]

A complementary measure of change is book production on a larger scale. As of 1982, the Arab world produced 40 books per million inhabitants, far below the world average of 162 titles per million. Although more recent figures are unavailable, there are signs that this gap is rapidly closing (Sabat 1989:18). In countries such as Morocco, a demand for “quality” books in Arabic has developed since the mid-1980s (Albin 1990).

At the same time, however, the most rapid growth for the printed word is in what Gonzalez-Quijano (1994) calls “Islamic books,” inexpensive, attractively printed texts, accessible to a readership that lacks the literary skills of the educated cadres of an earlier era. The written form often evokes the breezy style of colloquial diction. The covers take advantage of modern printing technologies and, as a result, are both readily accessible and eye-catching. In one example, a Saudi pamphlet has a curious cover that shows a bright red ball plunging into a well in an otherwise parched desert (fig. 4). The text explains that democracy, which is “creeping” (tatasarrub) into the Muslim world, is incompatible with Islam because Islam offers governance by the Creator (al-khaliq), as understood by a properly instructed religious elite, whereas democracy, a non-Arabic term, necessarily implies rule by the created (al-makhluqin), in which unbelievers and the ignorant have an equal say in governance and usurp God’s rule (al-Sharif 1992/1412:16–18). In many parts of the Muslim world, including North Africa, this style of argument is regarded with amusement by many, but it also offers an accessible style of argument for many recent beneficiaries of mass education.

In Ilorin, Nigeria, there has been a proliferation of Islamic educational institutions, helping to stimulate a market for Arabic publications. The formal educational sector consists of Western-style schools, encouraged by the British colonialists; modern style Arabic-language schools in which Islamic and modern subjects are taught; and “traditional” schools devoted to Islamic learning. These are not mutually exclusive forms of education, for students are typically exposed to more

[[d-f-dale-f-eickelman-and-james-piscatori-muslim-po-6.png][Fig. 4. Unoriginal in argument, Muhammad Shakir alSharif’s The Truth about Democracy (1992) nonetheless addresses a theme that concerns many religiously minded Muslims. Its low price and wide distribution give it a significant audience.]]

than one kind of school. In the late 1970s and 1980s, possibly 75 percent of students in the formal educational sector—involving increasing numbers of girls—were enrolled in Islamic schools. Arabic has thus emerged as a popular educational and literary medium. Of particular importance has been the influence of shaykhs such as Adam al-Iluri (1916–92), who, with his influential school near Lagos and his Arabic writings, stimulated both awareness and discussion of Arabic publications among the public (Reichmuth1993).

Like modern mass communications, mass higher education and publishing contribute to objectification by inculcating pervasive “habits of thought” (Bourdieu 1988, 1989). They do so by transforming religious beliefs into a conscious system, broadening the scope of religious authority, and redrawing the boundaries of political community. The objectification of Islam means that religious beliefs and practices are increasingly seen as systems (minhaj) to be distinguished from nonreligious ones. When activist thinkers such as Sayyid Qutb (1906–66) write of Islam as a minhaj, they imply more than “system” or “program,” the translations commonly given. The term can also imply that something has been made open, manifest, and clear. For Qutb, as for other activists, it is not sufficient simply to “be” Muslim and to follow Muslim practices. One must reflect upon Islam and articulate it. When activists declare that they are engaged in the “Islamization” of their society, the sense of thinking of religious beliefs as an objective system becomes explicit. Thus “the Muslims” (al-muslimun) is a term used by Moroccans since the 1980s to refer to activists who say that they wish society to live exclusively by Islamic precepts. Irony is far from absent in the term, since all but about 20,000 of Morocco’s 26 million citizens are Muslim.

Another indication of the systematization of Islam is the growing popularity of catechisms among Muslims. For example, the influential Egyptian preacher Muhammad Sha‹rawi (n.d.) has compiled a catechism-like primer of thirty pages on questions involving women’s acts of faith, social relations, and the Islamic laws that regulate them. Similarly, A‹usht (ca. 1982) provides the Ibadiyya of Algeria, Zanzibar, and Oman with a description of the “essential” tenets of Ibadi doctrine, history, and principles. One use of such tracts is to explain doctrinal tenets to other Muslims. Omani students in the United States are provided with pamphlets in English (such as “Who Are the Ibadhis?”) for this purpose (al-Khalili 1988; see also, Eickelman 1989b:4–5). Such catechisms assume that their users are familiar with the subject headings and indexes that format the information.

In the case of the Nurculuk movement, which began in Turkey early in this century and today has followers in Germany, California, and elsewhere, the teachings of its founder, Saïd Nurcî (1873–1960)—originally written and passed on by hand because of Turkish government hostility—have been collected in pamphlets with titles such as The Miracles of Muhammad (1985a), Belief and Man (1985b), and Resurrection and the Hereafter (1985c). These pamphlets have “the function of explaining, in accordance with the understanding of the age, the truths of the Qur›an” (1985d). Nurcî insists that books, not people, “have waged a battle against unbelief” (Nurcî in Mardin 1989:4). As these pamphlets demonstrate, the formalized textual transmission of ideas is especially valued as a way to advance approved understandings of Islam. Other examples of this genre include Hamidullah (1959), intended as a “correspondence course on Islam” and available in several languages, and Soymen (1979), available in Turkish and English as a “manual” for Muslims. Pilgrimage manuals, another popular literary form throughout the Muslim world, similarly indicate a growing systematization of the ways in which belief is expressed (see Metcalf 1990).

A second facet of objectification is that authoritative religious discourse, once the monopoly of religious scholars who have mastered recognized religious texts, is replaced by direct and broader access to the printed word: More and more Muslims take it upon themselves to interpret the textual sources, classical or modern, of Islam. This transformation was implicitly recognized in King Fahd's statement, cited earlier, that points to the broad spectrum of permissible interpreters of Islamic law in the modern period. Hasan al-Turabi (b. 1930), Sorbonneeducated leader of the Muslim Brothers in the Sudan and a former attorney-general, has made the point more forcefully: "Because all knowledge is divine and religious, a chemist, an engineer, an economist, or a jurist are all ‹ulama›" (1983:245). Turabi is implicitly building on an Islamic tradition that affirms the authority over the faithful of those who possess religious knowledge (‹ilm). One saying (hadith) of the Prophet found in al-Tirmidhi's compilation is that "the superiority of the learned man over the worshipper (al--abid) is like the superiority of the full moon over the stars" or like the Prophet's authority over the least of his followers (cited in Asad [1961] 1980:86–87).

Although the possession of religious knowledge continues to have similar political consequences, religious activists in Egypt, the West Bank, Central Asia, Indonesia, and elsewhere are more likely to be the products of mass higher education than of such traditional educational institutions as the madrasa, or mosque school. Indeed, Muslim activist discourse, like that of Morocco's Abd Assalam Yassine (b. 1928), assumes a familiarity with the language of Marxist and other "Western" discourses against which it confidently reacts (1981). Likewise, Sayyid Qutb's book, Ma-alim fi-l-tariq [Signposts] (1981), written by a nontraditional intellectual and said to be the most widely read book among younger Muslims worldwide, would never have had the impact it has had without the spread of mass education and the access to analytical and exegetical texts that education provides.

Third, and finally, following directly from our point concerning the implications of direct access to the printed word, objectification reconfigures the symbolic production of Muslim politics. An objectified Islam has come to seem so natural and the impact of Islam on mass politics so clear that the question of who speaks for an objectified Islam becomes central to Muslim politics. Whereas the ‹ulama and the state have often made mutually beneficial accommodations to each other, the relationships between them and the newer Muslim leaders have become unpredictable. Who could have predicted in 1990 that a fortyyear-old mechanic in Tajikistan, Muhammad Sharif Hikmat Zade, would become the leader, two years later, of a transnational political movement in Central Asia and Russia, the Islamic Renaissance party?

In effect, the state, the ‹ulama, and the "new" religious intellectuals all compete to gain ascendancy as the arbiters of Islamic practice. The political implications of this process were evident in nineteenth-century India, where the multiplication of printed texts, at first controlled by the ‹ulama, "struck right at the heart of person-to-person transmission of knowledge; it struck right at the heart of Islamic authority" (Robinson 1993:239). Print at first enabled the ‹ulama to expand their influence in public

affairs because they sponsored and controlled religious publications. Yet the ironic consequence of printing was to reduce the authority of the ‹ulama in the long run because of the rapidly increasing number of educated persons and the shift to more accessible vernacular languages (Robinson 1993:245). Similarly, the educational reforms that unfolded in the Tanzimat period in the Ottoman Empire brought about profound changes in the content and methods of transmission of knowledge. Education had previously been tied to the Islamic sciences and was transmitted from person to person. Textbooks, dictionaries, manuals, and encyclopedias supplemented, if they did not displace, the direct authority of the teacher. The results of this process became apparent in the 1890s, with the first generation to emerge from the reformed schools of the Tanzimat:

Speculation and projection of information culled from books opened up a Pandora’s box roughly similar to that which had informed early modern criticism of the text of the Bible in Europe. But even more was afoot: young officials preparing plans for new institutions were now propelled into a realm of abstract possibilities which was beginning to seem much more real than the conglomerate of rickety frame houses, crumbling public buildings and venal officials from which they started. (Mardin

1989:120)

In the last third of the twentieth century, this process of educational and social change has been intensified by mass higher education and mass communications and has created “Islamists,” that is, Muslims whose consciousness has been objectified in the ways we have described and who are committed to implementing their vision of Islam as a corrective to current “un-Islamic” practices. This commitment implies a certain measure of protest, demonstrated in a variety of ways, against the prevailing political and social status quo and establishments. The term “Islamists” (al-islamiyyun) is used by Muslim activists, such as Lebanon’s Muhammad Husayn Fadlallah (b. 1935), to refer to adherents of “the Islamic movement” (al-haraka al-Islamiyya) (for example Fadlallah 1990:238–40), and Tunisia’s Rashid al-Ghannouchi (b. 1942), for whom it contextually implies ideologically motivated Muslims (al-Ghannouchi 1992:47).[18] Islamist authority to remake the world derives from a self-confident appropriation of what they believe to be “tradition.” The rules of the game—whether or not they were ever unambiguous—are thus certainly complex and uncertain now. The stakes are high, and it is to this Muslim competition over what we call sacred authority that we now turn.

** 3. Sacred Authority in Contemporary Muslim Societies

*** The Linkage of Religion and Politics

MOST DISCUSSIONS of Islam and politics assume that “Islam” makes no distinction between the religious and political realms. Western scholarship—and, to a significant extent, Muslim scholarship—emphasizes the inseparability of the two by comparing Muslim with Christian political thought. Although the metaphor changed in early and medieval Christian writings, the idea of a separation of powers remained constant: God’s and Caesar’s due, the pope’s and emperor’s swords, the ecclesiastical sun and imperial moon. In Islamic thought, in contrast, the frame of reference has been the indivisibility of the whole: din wa-dawla, “religion and state.”

This view of indivisibility finds support in more than forty references in the Qur’an to the need to obey “God, His Prophet, and those of authority among you” (for instance, 4:59). It also builds on the example of the Prophet, at once a spiritual leader and the head of a political community. As we have discussed, the defense of the institution of the caliphate was also predicated on the belief that religious and political power needed to be combined in one office, thereby allowing the shari’a to be implemented and the community of Muslims protected.

A careful reading of the historical record indicates that politics and religion became separable not long after the death of the Prophet and the establishment of dynastic rule. It has been argued that the bifurcation of the legal system over time, with shari’a courts operating alongside the diwan al-mazalim (board of grievances), “came close to the notion of a division between secular and religious courts”; the institutions represented two different authorities, that of God and the ruler (Coulson 1964:128–29). Some date the separation of functions and institutions to the Turkish Seljuk dynasty, which took virtual control in the ‘Abbasid capital of Baghdad in the mid-eleventh century (Lewis 1979:169–70) or to the Buwayhid intervention in Baghdad in 945, which “terminated the Abbasid caliphs’ dual role as the temporal and spiritual leader of the Islamic nation” (Ahmed 1985:18). Others argue that this functional separation had taken place by the ninth century, with the establishment of schools of law and the emergence of an interpreting class—the ‘ulama—who possessed semiautonomous sources of financial and political support.

Lapidus (1975:383) argues that opposition was particularly significant to the rule of the Caliph al-Ma’mun (813—33), who insisted that all Muslims adhere to the Mu’tazali theological movement. Opposition centered around the Hanbali school of law, which qualified caliphal claims to absolute power by emphasizing the availability of the Qur’an and Prophetic traditions (hadith) to every believer. Although the Han-balis remained loyal to the ‘Abbasid state, they devalued the caliph’s presumption of a monopoly on the basis of religious legitimacy. “The growth of religious loyalty to hadith and the long struggle over doctrine and authority had crystallized a conception of the umma of Muslims as a community founded upon loyalty to religious principles.... Henceforth, the Caliphate was no longer the sole identifying symbol or the sole organizing institution, even for those Muslims who had been most closely identified with it” (Lapidus 1975:383). While the ^culama continued to cooperate with the political authorities, the religious sphere acquired its own identity, institutions, and discourse. In effect, a

religious establishment emerged as a complement—and sometimes as a rival—to the political establishment.

Many Arab historians perceive a major division between the rule of the rightly-guided caliphs and that of their successors (see, for example, Ibn Khaldun 1967:1:418–23). Mulk (royal authority, or kingship), implying dynastic rule, came to be seen as a deviation from the purity of the caliphate. This view implicitly acknowledges that a cleavage between religion and political rule began when the Umayyad dynasty came to power in 661. In the case of Muhammad's first four successors, "No mention was made of royal authority, because royal authority was suspected of being worthless, and because at that time it was the prerogative of unbelievers and enemies of Islam" (Ibn Khaldun 1967:1:418).

One can argue that the division of spiritual and temporal powers occurred even earlier—on the death of the Prophet in 632. The caliphate was merely a temporal institution since religious succession to Muhammad, the "seal of the Prophets," was impossible. The caliph held political and military powers, and while it was true that he could serve as an Imam during prayers and deliver the khutba or sermon, other Muslims were also able to do so. "The caliph's relation to religion was merely that of a guardian. He defended the faith just as any European emperor was supposed to do, suppressed heresies, warred against unbelievers, and extended the boundaries of Dar al-Islam (the abode of Islam), in the performance of all of which he employed the power of his secular arm" (Hitti 1953:185).

In the Shi'i world, the Imamate—the institutional apex of authority—is assumed to possess both religious and political powers. But the view that the Imamate is ineluctably a religio-political office developed only gradually, largely in response to repeated failures to exercise power. Despite the common insistence that the Imams descended in an unbroken line from 'Ali and Husayn, it is likely that at least two Imams were not recognized as having this status in their lifetimes. Moreover, although they aspired to rule, in fact they failed to capture the caliphate. Political failure inspired maximal religious justification, and there was a growing recognition that the spiritual powers of the Imamate were more important than its temporal rule.

In the Ithna 'Ashari ("Twelver") tradition, the dominant Shi'i tradition, hopes of Shi'i rule were decisively abandoned by the death of the eleventh Imam, al-Hasan al-'Askari (845–73), and his position accordingly acquired superhuman, divinely appointed qualities in the late ninth and tenth centuries. The Imamate emerged as the "proof" (hujja) for mankind in the ninth century and it was soon considered immune from sin, and, only slightly later, from error as well (Halm 1991:29, 45–46). A full-blown rationale for Imamate authority thus developed over time and was applied retroactively.

Following the occultation (ghayba) of the last Imam in 941, the question of who represents him intensely complicated the Shi'i theory of religio-political rule. The 'ulama positioned themselves as the heirs and defenders of the Imamate, but political rule largely came to be viewed as illegitimate in the absence of the Imam. The state was thus essentially an invalid institution as long as the Imam was not himself present to rule. Not until the advent of the Islamic revolution, which, as we have seen in Chapter 2, redefined the nature of the Islamic state, were the 'ulama anything more than the guardians of the religious traditions, the moral critics of the regime, or, perhaps more often, the legitimizers of secular rule.

**** Politicizing Religion

As common as the concept of din wa-dawla is, there are significant variations in its interpretation. Ayatullah Khomeini felt so strongly that the 'ulama had abdicated their responsibilities in the shah's period that he constantly inveighed against apoliticism and disinterest. Opposition to the Saudi monarchy, which has espoused the need for acquiescence to prevailing political authority, strengthened the Ayatullah's antipathy toward those who would not engage fully in the political fray. As Khomeini wrote in his will: "As for [those] who consider Islam separate from government and politics, it must be said to these ignoramuses that the Holy Qur'an and the Sunnah of the Prophet contain more rules regarding government and politics than in other matters" (Khomeini [1983] n.d.:22).

Although Khomeini had pronounced views, his thinking evolved throughout his lifetime and ended in what many regard as an extraordinary, even heterodox, position. His 1941 book, Kashf al-asrar [The discovery of secrets], juxtaposed virtuous Islamic government with the sorry state that obtained in nominally Muslim societies but conceded that "bad government is better than no government" (cited in Fischer 1980:152). Although some kings were morally corrupt, the institution of kingship is permissible. Moreover, "we do not say that government should be in the hands of the faqih [jurist]; rather we say that government must be run in accordance with God's law ... and it is not feasible except with the supervision of the religious leaders" (cited in Fischer 1980:152).

Khomeini's opposition to the shah intensified after the reforms in property ownership, education, and women's rights during the White Revolution of 1961–63 angered a significant portion of the 'ulama. He emerged as the indisputable leader of the June 1963 uprising against the reforms and, as a consequence, was sent into exile. While in the Shi'i shrine city of Najaf in Iraq, and partly as a result of his interaction with two politically active scholars, Musa al-Sadr and Muhammad Baqir al-Sadr (d. 1980), among others, Khomeini began to formulate a more assertive theory of Islamic government that put the fuqaha (sing., faqih) at the center of power. Revising the ideas of Shaykh Murtada Ansari (d. 1864) on the Umi ted wilaya (guardianship) of the 'ulama, Khomeini (cited in Enayat 1983:163) argued that "wilaya consists of government and administration of the state and the implementation of the laws

of the sacred path.” But this responsibility cannot be entrusted to kings. Islamic government requires a governor who knows the shari’a—the sole law—and is just. The Shi’i Imams possessed these qualities, and since their occultation, wilaya has fallen collectively to the fuqaha. The inexorable logic of this approach, of course, casts the most learned and just of the jurists in the position of supreme power. “Guardianship of the jurist” (vilayat-i faqih) thus becomes the imperative of Islamic government, and the obligation to obey it is essential.

Toward the end of his life, Khomeini’s theory became even more extensive. Faced with a constitutional deadlock in which the majority of the Majlis, or national assembly, and the supervisory Council of Guardians could not agree on certain legislation, he was asked by President ‘Ali Khamene’i to comment on the president’s interpretation of the limitations on the power of the supreme faqih. Khomeini asserted that Khamene’i had been wrong to say that the government could exercise power “only within the bounds of divine statutes.” Because the need for Islamic government is absolute, it—and, by extension, the ruler—possesses nearly absolute power.

<quote>

I should state that the government which is a part of the absolute viceregency of the Prophet of God ... is one of the primary injunctions of Islam and has priority over all other secondary injunctions, even prayers, fasting and hajj.... The ruler can close down mosques if need be, or can even demolish a mosque which is a source of harm.... The government is empowered to unilaterally revoke any Shari’ah agreements which it has concluded with the people when those agreements are contrary to the interests of the country or of Islam. It can also prevent any devotional or non-devotional affair if it is opposed to the interests of Islam and for so long as it is so. The government can prevent hajj, which is one of the important divine obligations, on a temporary basis, in cases when it is contrary to the interests of the Islamic country. (BBC SWB 0043, A/7, January 8, 1988)

</quote>

Doubtless with an eye to the critics of the Majlis who had formulated their criticism in Islamic terms, Speaker Hashemi Rafsanjani seized on the Ayatullah’s pronouncement: “It is an immense injustice to Islam if it cannot demonstrate its power on essential issues of the state” (BBC SWB 0043, A/8, January 8,1988). Suitably chastened, President Khamene’i now noted the Ayatullah’s wisdom in creating a thirteen-member assembly, the High Council for the Discernment of Interests, to break the legislative impasse. Because Khomeini had delegated his powers of supreme faqih to this new body, it could determine the interests of the state: “And what it deems to be the interests of the regime is then an Islamic and religious decree. Why? Because the preservation of the regime depends on it, or the preservation of social welfare depends on it, or the preservation of security and order depends on it” (BBC SWB 0087, A/3, February 29, 1988).

Inverting the commonly held assumption that the purpose of the Islamic state is to preserve and protect the shari’a, Khomeini thus declared that the regime is empowered to curtail provisions of the shari’a in order to protect the regime. President Khamene’i baldly summarized the argument: “The preservation of the Islamic regime is a theological order, the preservation of the Islamic Republic is a tenet of jurisprudence” (BBC SWB 0087, A/3, February 29, .1988). Another leading religious figure, Ayatullah Ni’matullah Salihi-Najafabadi, contributes to the doctrinal controversy by arguing that the vilayat-i faqih is based on a social contract between the people and the faqih and incorporates the principle of majority rule (Moussavi 1992).

Prior to the Islamic revolution, the highest recognized level of religious leadership was the marja’-i taqlid (“source of emulation”). Ayatullah Muhammad ‘Ali Araki, the last of the generally recognized marfa’s, died in December 1994, following the deaths of Ayatullah Abu’l-Qasim al-Khu’i in mid-1992 and Ayatullah Muhammad Reza Golpayegani in late 1993. The cumulative effect of these deaths was to throw the Shi’i world into confusion over how to choose a successor or successors. Consistent with the maximalist view of the Islamic state that the Iranians have promoted since 1988, elements within the Iranian government appeared to nominate the supreme leader of the revolution, Ayatullah Khamene’i, to this position. Others suggested that his erudition was not of sufficient distinction to merit this status, and the followers of Ayatullah Khu’i have suggested that while the Iranian government has a special place in the deliberative process, the traditional colleges of Shi’i learning, particularly Najaf, must not be marginalized (“The Future of the Maija’iyya” 1994). These reevaluations of the powers of the faqih, Islamic government, and the marja^c</sup>-i taqlid indicate once again that doctrine is never fixed and that it may evolve in surprising directions—directions that many would regard as heretical.

**** Functional Division of Religion and Politics

By way of distinct contrast, others believe that too great an involvement with politics may mislead or corrupt the believers. For example, the Tablighi Jama’at, a significant movement of reform that originated in South Asia but now has worldwide influence, believes that the separation of religion and politics is necessary in the short term. It implicitly criticizes the quest for political power in which other Muslim groups, such as the Muslim Brotherhood, are engaged. As God’s vicegerent (khalifa), men are given the earth to govern but are not worthy to do so until they can govern themselves. In effect, therefore, they must eschew politics until they prove themselves worthy of being political (generally, see Masud 1995).

Taking this further, some argue that Islam is only ritual and that politics must be separated from religion. An early example of this was seen in the military opposition to the ‘Abbasid caliph al-Nasir (1180–1225). The military leaders argued:

<quote>

If the caliph is the Imam, then his constant occupation must be prayer, since prayer is the foundation of the faith and the best of deeds. His preeminence in this respect and the fact that he serves as an example for the people is sufficient for him. This is the true sovereignty; the influence of the caliph in the affairs of government is senseless; they should be entrusted to sultans (recorded by the Persian historian Ravandi [al-Ra-wandi], cited in Lewis 1988:47–48).

</quote>

Reflecting the obvious desire to ward off religiously based opposition, contemporary leaders, including Jordan's King Hussein and the Algerian government, prefer to emphasize the spiritual nature of Islam and caution against mixing religion and politics. In Malaysia, Prime Minister Tun Hussein bin Onn (1922—90, r. 1976–81) warned against allowing "religion to be made a political tool" (Mutalib 1990: 147). In announcing the creation of a Ministry of Religious Affairs in March 1992, Tunisian president Ben 'Ali (b. 1936; r. 1987-) spoke of religion as "an element of unity and amity" that must remain "above political considerations" as it guides all Tunisians to "do good deeds and to shun evil, sin, and transgression" (BBC SWB 1322, A/ll, March 6,1992). Explicitly adopting a tenet of Christian political thought, King Hassan of Morocco denounced Islamic "fundamentalism" (al-usuliyya) as "religious deviation" (al-shudhudh al-dini) and spoke disparagingly of its adherents, who have placed themselves outside Islam by their political manipulation of religion: "We should resort to what the Christians say: render unto God that which is God's and unto Caesar (Hiraql) that which is Caesar's" (Hassan II 1993:8).

Unlike Hassan II, Iraq's President Saddam Hussein does not bear the title amir al-mid minin (commander of the faithful), but his views on mixing religion and politics are similar:

<quote>

For the sake of religion, we should not name ourselves clergymen or mix religion and the state's performance of its duties.... If we in Iraq were to use politics in a religious framework, we would become a team within a certain religion or teams within religions and sects. Then we would be dividing the Iraqi people. The same thing would happen in Egypt. Therefore, we must first separate religion from politics and then avoid being sectarian. (FBIS, NES-87-127, July 2, 1987, p. K4)

</quote>

Although the political expedience of this line of thought is obvious, some writers have invested the separation of religion and politics with doctrinal significance. 'Ali 'Abd al-Raziq (1888–1966), a shaykh of al-Azhar mosque-university in Cairo, ignited an

explosive controversy in 1925 when his book, al-Islam wa-usul al-hukm (Islam and the roots of government) suggested that the religious and administrative powers of the Prophet were separate. Muhammad's governance of the Muslim community at Medina was not part of his Prophetic mission, and his successors, the caliphs, succeeded only to temporal power.

Although 'Abd al-Raziq was made to stand trial before his colleagues (Henderson 1925; Egypt 1925) and was ultimately removed from his teaching position, this line of argument has persisted. The Pakistani writer Qamaruddin Khan, for example, has proposed that the political theory of Islam does not arise from the Qur'an but from circumstances and that the state is neither divinely sanctioned nor strictly necessary as a social institution. The Muslim "constitution" is flexible and should not have become the rigid and intellectually indefensible institution it has become as a means to defend the political status quo in Muslim societies. Khan argues that Muslims need to understand that there is nothing preordained about the intimate admixture of religion and politics:

<quote>

The claim that Islam is a harmonious blend of religion and politics is a modem slogan, of which no trace can be found in the past history of Islam. The very term, "Islamic State," was never used in the theory or practice of Muslim political science, before the twentieth century. Also if the first thirty years of Islam were excepted, the historical conduct of Muslim states could hardly be distinguished from that of other states in world history. (1982:74)

</quote>

The modernist Fazlur Rahman believes that the injection of politics into the religious sphere has been deleterious. He argues that Islamic precepts should govern politics, but what has occurred instead is the exploitation of Islamic concepts and organizations by political groups and elites. The result has been "sheer demagoguery" rather than morally inspired politics. "The slogan Tn Islam religion and politics are inseparable' is employed to dupe the common man into accepting that, instead of politics or the state serving the long-range objectives of Islam, Islam should come to serve the immediate and myopic objectives of party politics" (1982:140).

The Indonesian intellectual Nurcholish Madjid (b. 1939) has argued that Islam does not require an Islamic state (negara Islam) and that "secularization" (sekularisasi)—the process of distinguishing the divinely ordained from what has been devised by humans—is essential. In his early writings, he argued that any separation of religion and state would unacceptably mean that "God has no right to administer worldly affairs" (cited in Hassan 1982:24) and would thus be a deviation from the principle of tawhid (the oneness of God). But since 1970 his thinking, influenced by the ideas of Harvey Cox and Robert Bellah, has evolved, with tawhid becoming the very reason for secularization: "Islam itself, if examined

truthfully, was begun with a process of secularization. Indeed, the principle of Tauhid represents the starting point for a much larger secularization" (cited in Hefner 1993:6; see also Hassan 1982:92–93). While Madjid acknowledges that many understand "secularism" when they read "secularization" and that such misunderstandings are to be regretted (Madjid 1995), he is committed to the view that the Muslim community will benefit from an Unambiguous distinction between matters which are transcendental and those which are temporal. In so desacralizing human activities, the umma will be liberated of the hold of traditionalism and will be open to progress and a future based on rationality and the modern sciences.

Nasr Hamid Abu Zayd, an Egyptian professor denied tenure at the University of Cairo for his supposedly un-Islamic views, has elaborated a sophisticated indictment of the deleterious political ramifications of ascribing to oneself the definitive right to interpret sacred texts. In Naqd al-khitab al-dini (A critique of religious discourse), he argues, despite obvious differences between the official religious establishment and oppositional Islamists, that their religious discourse is remarkably similar in its claim to represent holy writ. In invoking textual authority to justify what in effect is their interpretative license, their reasoning becomes circular and closed, denying others a similar right to interpretation. Al-Azhar 'idama thus proclaim the Islamists of al-Jama'at al-Islamiyya (the Islamic Associations) as beyond the pale of orthodoxy, and the Islamists similarly anathematize both the 'ulama and the secular elite, thereby polarizing and subverting the political life of society (Abu Zayd 1992).

Muhammad Sa'id al-Ashmawi, a prominent Egyptian judge and writer, argues that many of the past failures of Islamic history have been due to the very mixture (khilf) of religion and politics. An examination of the bases of Islamic law in his view reveals that the Qur'an contains relatively few direct legal commands, and the attempts of the "fundamentalists" to prescribe action in every sphere, justified as required by the shari'a, is self-aggrandizing. This presumptuousness inevitably leads to distortions of Islam and limitations on individual liberties. The first sentence of his al-Islam al-siyasi (Political Islam) emphatically throws down the challenge to dogmatic Islamists and is daring in its certitude: "Allah intended that Islam be a religion, [whereas] people (al-nas) understood it to mean politics" (al-Ashmawi 1987:7; see also al-Ashmawi 1990).

The Libyan leader, Mu'ammar al-Qadhdhafi (b. 1942, r. 1969-) incurred the wrath of many Muslims in Libya and throughout the world and such groups as the Muslim Brotherhood for his revision of the Muslim calendar, his radical criticism of the tradition of the Prophet (sunna), and his harsh treatment of the 'ulama (Davis 1987:56). He has not been adverse to manipulating Islamic traditions and discourse to justify his policies and extend his own influence. Yet, he has also endorsed the view that religion and state are separate realms which, when combined, become dangerous: "Prophecy has nothing to do with politics or the state.... [W]hen we deal with politics the supernatural becomes irrelevant.... [T]he political factor and all that is related to it is a subjective problem

facing the human communities on this planet—a problem they have the right to resolve the way they deem fit" (al-Qadhdhafi 1985).

In Indonesia, the Nahdatul Ulama ("the Revival of the 'Ulama") party (NU) eschewed a direct political role from its inception in 1926. It preferred to emphasize the social welfare duties of Muslims. Although it joined other Muslim groups in 1973 to form the United Development party, NU—which has some thirty million followers— returned to its apolitical stance when it chose Abdurraham Wahid (b. 1940) its leader in 1984. Committed to the idea of a pluralist, democratic, and nonsectarian Indonesia, Wahid has vigorously argued that religion and politics are separate, and that Islam does not incorporate any notion of state: "Islam should be implemented as social ethics and mores, not laws. We have to protect the national view, not the Islam view" (cited in Schwarz 1992a; also see Schwarz 1992b; Wahid 1995). This apolitical stand appeared to be reinforced at NU's twentyninth national conference in December 1994, when Wahid was reelected as leader.

An extension of this argument, although it is held by a minority, holds that religious thought, by its very nature, is obscurantist. Religious scholars, in particular, take upon themselves the role of defending tradition, but in fact they utilize it as a means to power and control. Sadiq al-'Azm, a Syrian philosopher who has written on Immanuel Kant, has trenchantly criticized the prevailing ideological straightjackets and deceptions of the modern age, whether these be Arab nationalism (1968) or religion (1982). In his view, "fundamentalism"— Christian or Islamic—is based on a "principled rigidity" (1993b:91), and while it is possible that fundamentalists will adapt to the needs of the modern world, this will mark the triumph of secular reason: "In the longer run the resulting socio-historical secular reality will inevitably burst through the mystical shell of Islam" (1993b:97). Although the manner of argumentation is markedly different, Aziz al-Azmeh, a professor of Arab and Islamic Studies at the University of Exeter, similarly undermines the assumption of an indivisibility of religion and politics. Rather than making secularism the antithesis of Islam, he questions the dichotomy and points to the possibility of an "Islamic secularism" (1993).

It is evident that Muslims hold a variety of opinions on the relationship between religion and politics. Yet, despite both the intellectual diversity and the early history of Islam, the assumption of "Caesero-papism," the indivisibility of the two realms, persists in the study of Islam. This is the case for some Western writers (for example, Endress 1988:32; Watt 1980:29) and for Muslim writers who advocate particular interpretations of Islam. The view that Islam is indistinguishably religious and political is found in the writings of Khurshid Ahmad (1976:36–37), Muhammad Asad (1980:2–6), Muhammad Husayn Fadlallah (1986:258–62), Rashid al-Ghannouchi (1993:51), Abu-1 A'la al-Mawdudi (1976:17–18; 1986:68–69), and Hasan al-Turabi (1983: 241–42; 1987).

The presupposition of the union of religion and politics, din wa-dawla, is unhelpful for three reasons, however. First, it exaggerates the uniqueness of Muslim politics. Religion is obviously central to the political life of peoples around the world, not simply to

Muslims. The Moral Majority in the United States, “base ecclesiastical communities” and advocates of liberation theology in Latin America, Archbishop Desmond Tutu in South Africa, Pope John Paul II in Poland and eastern Europe, Sikh activists in India, Buddhist monks in Burma or Vietnam—these are a few of the practitioners of “religious politics” at work throughout the world who sometimes assert the indivisibility of religion and politics. Indeed, issues such as abortion, racism, political and economic refuge, and nuclear war have prompted religious groups to take a direct stand on policy issues and to seek to inject divine injunctions into all levels of the political process. In this regard, although the issues have not always been the same, the Muslim political process is not radically different from that of other societies.

Second, the emphasis on din wa-dawla inadvertently perpetuates “Orientalist” assumptions that Muslim politics, unlike other politics, are not guided by rational, interest-based calculations. Part of the reason lies in the general preference in the social sciences for the rational actor, which, as discussed in Chapter 2, tends to make religion a nonrational—if not an emotional and irrational—factor. But an Orientalist scholarship that emphasizes differences between “East” and “West” and often projects stereotypes has not been averse to accepting nonrational religion as the defining characteristic of Muslim political and social life. In effect, therefore, because of the omnipresence of religion, Muslims are thought to be passionate, uncontrollable, intransigent, and impossible to negotiate with. As Yehoshafat Harkabi, a former chief of Israeli military intelligence, has observed, “Islam doesn’t recognize coexistence as a basic doctrine. Coexistence goes against Islam’s sense of world order” (cited in Gelb 1992).

Third, the din wa-daivla assumption contributes to the view that Muslim politics is a seamless web, indistinguishable in its parts because of the natural and mutual interpenetration of religion and politics. Because Islam is thought to incorporate all aspects of life and because everything is thus assumed to be political, political structures are underestimated. Like all political communities, Muslim societies have distinguishable, though overlapping, structures. The mosque, madrasa (Islamic school), and majlis al-shura (consultative assembly), as well as the bureaucracy charged with regulating religious matters and professional associations, such as women’s lawyers’ groups, are institutions with shared but identifiable functions related to one set of religious beliefs and practices. They are the components of “sacred authority.”

*** Authority and the Interpretation of Symbols

Consistent with the argument developed in Chapter 1, our criticism of the din wa-dawla argument is built on a view of politics as the contest over the interpretation of symbols and as the setting of and negotiation over boundaries between spheres of social activity and institutions. Standard assumptions that religion and politics are inseparable or that religion and politics must be separated tell us little about how religious politics function.

The key to understanding the intricate and intersecting relationships between religion and politics lies, rather, in the nature of authority.

“Sacred authority” as a concept may appear to reaffirm the indivisibility of religion and politics—the conventional wisdom that has been questioned in this discussion. But our use of the term makes two fundamental assumptions:

1. Sacred authority is one kind of authority among others. It is not predicated on the indivisibility of religion and politics because not all authority is based on religion. Indeed, we are talking about a specific type of authority, one which remains distinct from authority based on control of, say, the military (leading to what some call the “praetorian state”) or the intelligence and security apparatuses—what has in the Middle East been called the mukhabarat (security police) state (see, for example, Wenner 1993:179). Our analysis, by way of contrast, is not exclusively preoccupied with the “Islamic state,” nor does it assume that religious authority is all-encompassing.

2. Sacred authority does not, by the same token, assume that religion and politics are completely independent spheres of activity. They are separable spheres that intersect and overlap according to context. The interaction occurs when groups or states vie to manipulate religious language and symbolism to induce or compel obedience to their wishes.

To have authority, like power, is “to be able to make a difference to the world” (Lukes 1986:5), but the two cannot be simply equivalent to each other. Whether authority is based on “the institutionalization of the normative order” (Parsons [1963] 1986:113) or “respect” (Arendt [1969] 1986:65), crucial to its meaning is its recognition as legitimate, whereas this recognition is not essential in the case of power. To answer the basic question of why does authority exist, the complex relationship between the carriers and followers of authority must be considered, and three interconnected levels of analysis are apparent— ideological, locational, and functional:

· •Ideological. Without wishing to predicate the argument on an abstract and unverifiable state of nature, as is common in political philosophy, we recognize that authority is invested in individuals and institutions because they are thought to incorporate and exemplify the moral order. In part, authorities are given authority because they appear to embody cherished values and represent the symbolic reference points of society, including sacred texts (Eickelman 1985:58–71; Messick 1993). Yet it is also clear that deference or acquiescence, the voluntary investiture of authority, is only part of the story. Those bearing authority transform themselves over time into “natural” leaders and, through the manipulation of the symbols of society and the invocation of tradition, they make claims of obedience and obligation on others. Authority inheres in those who are considered to have justifiable control over a society’s symbolic production, and with enhanced and

routinized elaboration of this control, leaders can compel obedience but usually prefer to encourage it (compare Mann 1986:22–24).

· Locational. In the case of the Muslim world, where values and symbols revolve around people's engrained belief in a transcendent yet immediate presence, the institutionalization of sacred authority entails multiple individuals and groups which hope to speak for the divine presence. These may be religious scholars, Islamist movements, the religious bureaucracy of the state, Sufi shaykhs, or traditional leaders such as village headmen or healers. Because symbols are ambiguous by nature and subject to widely differing interpretation, they are manipulable by these contenders for authority—thus promoting the fragmentation of authority. As elsewhere, the contention in Muslim societies over control or "appropriation" of symbols is intense, and authority is in part defined by one's position relative to competitors.

· Functional. Authorities also derive their prestige and influence from the performance of a number of functions. Endowed with symbolic capital, they are looked to for guidance and thus are expected to delimit and defend the "proper" place of Islamic discourse and practice. However, the logic of their role is somewhat circular. They draw boundaries because they have authority, and doing so further confirms their authority. Moreover, given the multiple centers of power in a society—whether expressly concerned with Islamic matters or not—authorities are esteemed because they mediate among the various poles. Illustrative of this are the 'ulama, who help to break through bureaucratic obfuscation and rigidity to secure housing or other social benefits for their "clients."

The bearers of sacred authority, including but not limited to the 'ulama, may not only serve as go-betweens but also represent specific social and economic interests. Sufi shaykhs in the African countryside often represent the interests of the peasantry, for instance, and the 'ulama in countries such as Iran, Syria, and Saudi Arabia often defend the interests of the bazaar or suq merchants, while Islamist groups may represent the interests of disenchanted and relatively nonmobile middle-class professionals. But values and interests are not radically divorced from each other, and, of course, values can be interests and interests can be valued. Interests are doubtless important in any political order, including the Islamic world, but they do not remain value-free or detached from the larger understandings that the political order engenders.

The interconnection of these ideas is evident even in societies where Muslims are a minority. In the Ningxia Hui Autonomous Region of Northwest China, local authorities guardedly tolerate the new emphasis among Hui Muslims on performing "correct" Islamic rituals, often spearheaded by Sufi orders such as the Khufiyya. They see this emphasis on ritual as socially and politically conservative. Yet they fear that the next stage of this religious revitalization may be "fanaticism." Hui Muslims do not differentiate between their ethnic and

religious identities, whereas state authorities seek to maintain a sharp distinction between them out of fear that religious activities may contribute to political destabilization. This dispute between state authorities and community religious leaders over the exclusion of the “religious” from the “political” domains is clearly expressed in the words of a local Communist party official in Yinchuan: “The Hui are allowed to maintain their ethnic customs that are influenced by Islamic traditions, but religion and ethnicity are two separate matters and should not be confused” (Gladney 1992a:97; see also Gladney 1991:132). In effect, state and local Sufi leaders contest the limits of sacred authority.

The case of Mayotte, a village of the Comoros Islands in East Africa, suggests that boundary questions are just as relevant to societies that have experienced less revolutionary change. Michael Lambek demonstrates that local religious officials (fundis) derive their immense authority from their knowledge of Islamic texts and a reputation for personal integrity. Yet they do not possess automatic political authority. Villagers appear willing to accord a senior religious man great respect and to follow his prescriptions in personal affairs and ritual, but they consider his intervention in a village dispute improper. The “partial disconnection of religion and politics” is the result. “Villagers believe that the fundis create and uphold the morality of the community by being fundis; once , they engage in partisan politics they threaten the very nature of morality itself” (Lambek 1990:34).

Fundis see it differently, however, believing that the moral universe encompasses land or tax disputes and even the programs of political parties. This disagreement over where morality ends and politics begins—or, to put the point somewhat differently, over what constitutes the nature of morality in a Muslim society and who creates and controls it—is intensely political.

**** Contesting Sacred Authority: Saudi Arabia

The Muslim politics of Saudi Arabia has also invoked questions about the changing nature of sacred authority there. At one level of interpretation, Saudi Arabia appears to be a near-perfect example of the indivisibility of religion and politics. In the mid-eighteenth century, Muhammad al-Sa^cud (r. 1745–65) was a local prince (amir) and Muhammad ibn ^cAbd al-Wahhab (1703–87) a zealous but unsuccessful puritanical reformer until they concluded a mutually advantageous alliance. The alliance propelled the Saudis to control of most of the Arabian peninsula and solidified “Wahhabism” as a major reform movement in modern Muslim history.[19] In the present period, the symbiotic relationship continues between the political and religious establishments: The monarchy needs the cooperation and approbation of the ‘ulama to enhance its legitimacy, while the ‘ulama need royal support and patronage to maintain their privileges and, to a lesser extent, to wield influence over policy making.

On another level of interpretation, a subtle contest over boundaries has taken place between the ruling family and religious officials. The monarchical elite has often circumvented the ‘ulama by relying on royal decrees (nizams), rather than fatawa, to make administrative, economic, and social changes. Although religious judges (qadis) retain substantial latitude in the judicial system, the king has often invoked his sovereign prerogative to mitigate the impact of shari’a court decisions.

The ‘ulama, for their part, have focused opposition on certain policies to force the regime to cede ground. For example, the Saudi government issued a decree in November 1950 that imposed an income tax on everyone in the kingdom, both Saudis and non-Saudis. The purpose was to increase the revenues of the state, primarily from the profits of the Arabian American Oil Company, but the ‘ulama objected to a tax on Saudi citizens because it would detract from the Muslim obligation to give alms {zakat). As a consequence, the revised royal decree of June 1951 deleted the income tax obligation on Saudis (CEDEFS 1967).[20][21]

In March 1992, King Fahd announced a series of administrative changes, which, because of their sweeping and unparalleled character, amounted to a constitutional package for the kingdom. Several of his predecessors had proclaimed their intention to reform the system by creating a consultative assembly, but they proved reluctant to command it (Piscatori 1983a:68–69). The regime appeared to have weathered the shocks of Nasserist pan-Arabism in the late 1950s and early 1960s, the rapid increase in oil-generated wealth in the 1970s, the Iranian revolution and the siege of the Grand Mosque in Mecca in the late 1970s, and the Iran-Iraq war in the 1980s. But the climate turned unfavorable early in the 1990s, partly as a result of the cumulative effects of rapid economic growth and the expansion of the educational system and partly as a result of the direct threat to the regime posed by the 1990 Iraqi invasion of Kuwait.

This invasion brought matters within Saudi Arabia to the boiling point. Middle-class elements regarded a regime that required hundreds of thousands of foreign troops to defend it as weak and narrowly based, while religious elements viewed it as tainted by intimate association with infidels. Both elements have pressed for reforms in a number of publicly circulated petitions or “advice” (nasihas). For example, a letter signed by forty-three merchants and professionals in December 1990 demanded greater accountability and called on the king to create consultative assemblies on both the national and local levels, to allow women greater freedom, and to curb the power of the “religious police” {al-mutawwa’uri).

A petition signed by eighteen Saudi religious leaders on May 18, 1991, called for the creation of a consultative council {majlis al-shura). Their concern was both to enhance the Islamic bases of the political system and to limit the influence of the more secular-minded among the middle classes. The religious scholars suggested, for example, that the

assembly’s members be selected on the basis of their “competence”—presumably in Islamic matters—and not on the basis of their social status or gender. They also called for the Islamization of the economy, media, military, and foreign policy (Haeri 1991). Reflecting the regime’s unease, senior ‘ulama denounced the public manner in which the demands were made; advice, they said, should not be divisive, and gratitude is owed the rulers for the stability and prosperity they have provided (BBC SWB, ME/1090, A/6-7, June 5, 1991).

Concerned about the general disquiet, the king maneuvered between the various factions when he promulgated the systemic reforms of 1992. His speech to the nation was a ringing reaffirmation of the religious nature of the state: The kingdom had been founded “on a clear programme of politics” that could be summarized by “belief and shari’a” (Fahd 1992). In the Basic Law of Governance (al-nizam al-asasi), the government was also careful to reiterate the Islamic basis of the state. According to the text of this law (Saudi Arabia 1992), it does not constitute a constitution (dustur) because only the Qur’an and the sunna of the Prophet are the true constitution of a Muslim society (Article 1). The political system is a monarchy (Article 5), but government “derives its authority (sultathu) from the Book of God Almighty and the sunna of His Prophet” (Article 7). Moreover, “the state protects the credo of Islam; it-implements its shari’a; it orders people to do right and avoid evil; it fulfills the duty of the call (da’wa) to God” (Article 23).

These provisions appeal to the religiously inclined elements of society, but the regime was also aware that many Saudis were irritated at the entrenched position of the ‘idama. As a result, the Basic Law of Governance incorporates provisions that qualify their traditional position in Saudi society. It requires that fatawa be based on the Qur’an and the sunna (Article 45) and that shari’a court decisions be similarly based on the principal sources of Islam as well as on “statutes issued by the ruler [waly al-amr}” that are consistent with those sources (Article 48). Perhaps the most important provisions, however, limit the de facto powers of the religious police. “No one shall be arrested, imprisoned or have their actions restricted. except in accordance with the provisions of the law” (Article 36), and, more importantly, “The home is sacrosanct [hurmatan] and shall not be entered without the permisssion of the owner or be searched except in cases specified by statute (al-nizam)” (Article 37).

The Saudi regime therefore walks a tightrope between competing claimants on the system. Despite the all-encompassing rhetoric in the Basic Law of Governance about the Islamic nature of the state, the regime has endeavored to delineate boundaries between its authority and those of the religious leaders and, to a lesser extent, the educated professional classes. Yet problems persist. In September 1992, over one hundred Saudi professionals and ‘ulama signed a memorandum bluntly calling for an end to corruption in royal and governmental circles and termination of the alliance with the United States. On May 3, 1993, a human rights group was formed in Riyadh by four university professors, a civil servant, and two lawyers; it was supported by a small number

of’ulama. Careful to invoke the traditional framework of shari’a in its name—Lajnat al-Difa’ ‘an al-Huquq al-Shar’iyya (Committe for the Defense of Legitimate Rights)—and calling for greater implementation of Islamic law (shari’a), the committee was openly critical of the Saudi goverment (see, for example, “Lajnat al-Difa’ ‘an al-huquq al-shar’iyya” 1993; New Saudi Rights 1993.

One religious scholar in the group, Shaykh ‘Abd Allah ibn ‘Abd al-Rahman al-Jibrin, had joined other ‘ulama in July 1992 in criticizing the regime for allowing torture and other abuses, in violation of Islamic law. The Minister of the Interior, Prince Nayf ibn ‘Abd al-‘Aziz, insisted that “governed by our Muslim beliefs, we in the Kingdom respect human rights more than any other state or society in the world” (BBC SWB 1690, A/9, May 17, 1993). Yet this assurance did not prevent the group’s proscription or the continued arrests of critics and dissidents. On May 12, 1993, the government secured a fatwa from the twenty-one members of the Hay’at Kubar al-‘Ulama (Council of Grand ‘Ulama), saying that the formation of the committee was unjustified because the kingdom, by God’s grace, was already ruled by Islamic law and that Saudis were able to redress grievances through the shari’a courts and other bodies (“Lajnat al-Difa’ ‘an al-huquq al-shar’iyya” 1993:7; see also, Walker 1993). In September 1994, 110 critics of the regime—including two religious scholars, Salman al-‘Uda and Safar al-Hawali—were arrested. One year earlier the king had asked the Council of Grand ‘Ulama to investigate and confront the dissident ‘ulama, but they had refused to recant their views. According to the regime, it was necessary to act before civil disorder (fitna) became entrenched, and the government resolved to act against those who interfered with the “destiny of the country” (muqaddarat al-bilad) and the “sanctities” (muqaddasat) of Muslims (“al-Sa’udiyya” 1994:4). Therefore, since the second Gulf war, the contest over the state’s hitherto relatively unchallenged monopoly on sacred authority has become intense.

**** Images in the Contest over Authority

In a less subtle way than the Saudis, Saddam Hussein has appropriated the symbols of Islam to bolster his rule. During the Iran-Iraq war, he ordered the construction of a massive new monument to celebrate Iraq’s inevitable victory over the Iranians and Saddam’s heroic leadership (see fig. 5). The monument depicts two giant hands holding crossed blades that represent the sword of Qadisiyya, symbolic of the battle in 637 in which Arab Muslim forces defeated Iran and brought it into the Islamic realm. The official invitation to the monument’s dedication in August 1989 left no doubt as to the connection between the divinely inspired leadership of seventh-century Muslims and that of Saddam Hussein which the monument is meant to suggest: “The ground bursts open and from it springs the arm that represents power and determination, carrying the sword of Qadisiyya. It is the arm of the Leader-President, Saddam Hussein himself (God preserve and watch over him) enlarged forty times” (al-Khalil 1991:2).

[[d-f-dale-f-eickelman-and-james-piscatori-muslim-po-7.png][Fig. 5. The Qadisivya Monument, Baghdad.]]

Faced with signficant Shi’i opposition to his secular and repressive rule, Saddam has also invoked specifically Shi’i symbolism to legitimize his position, despite his 1987 pronouncement, cited earlier in this chapter, that religion and politics should remain separate. Although he hails from the Sunni town of Tikrit, north of Baghdad, and has long been a committed member of the secular Ba’thist party, he has commissioned posters of himself riding a white stallion. White is a sign of purity, and the white horse is a familiar image associated with the Imam Husayn, martyred in the fields of Karbala in 680, who became the quintessential Shi’i hero (al-Khalil 1991:11, 14). In Karbala itself, a shrine city of immense spiritual signficance to Shi’a throughout the world, Saddam’s giant portrait stands next to the silver door to the tomb of the Imam ‘Abbas, and a nearby banner proclaims that “The visitors to the holy shrine in Karbala ask God to preserve Saddam Hussein.” The shrine of the Imam Husayn also sports a banner asking visitors to “embrace and thank the President for taking care of the holy shrine” (Cockbum 1992:13).

Other common ways for Muslim political leaders to assert their religious credentials and to affirm their sacred authority is undertaking the hajj and the public performance of prayer. With an eye to Indonesia’s 1992 legislative elections, President Suharto (b. 1921) made a highly publicized pilgrimage in 1991. Similarly, President Hafiz al-Asad (b. 1920) of Syria, concerned that his ‘Alawi background would make him appear heterodox to the country’s Sunni majority, prayed in public with King Faysal (ca. 1904–75), the devout king of Saudi Arabia. Both Syrian and other Arab media featured extensive coverage of the event. In 1973, al-Asad also obtained a fatwa from the head of the Higher Shi’i Council in Lebanon, the influential Imam Musa al-Sadr, declaring that the ‘Alawis constituted a branch of Shi’i Islam (Seale 1990:173).

Like states, religious actors often manipulate symbols to enhance their struggle with governments over who speaks for Islam. One group opposed to the Saudi and other Gulf monarchies, for example, employed a logo on its publications suggesting that it, rather than the House of Sa’ud represents Islam (see fig. 6). The logo features the Ka’ba, the focal point of the pilgrimage in Mecca, from which arises a globe and a rifle in a clenched fist. Underneath is the name of the group, Munazzamat al-Thawra al-Islamiyya fi-l-Jazira al-‘Arabiyya (Organization of the Islamic Revolution in the Arabian Peninsula), and above the picture is the Qur’anic phrase referring to the Prophet’s injunctions to his followers to proceed against Tabuk: “Go forth lightly and heavily [equipped] and strive with your wealth and persons in the cause of God” (9:41).

In Egypt, many Islamists have attacked the pyramids, Egypt's paramount national symbol, as a celebration of the pre-Islamic "era of ignorance" (jahiliyya)? They find inspiration for their views in the Qur'an, which memorializes the Pharaoh as "arrogant" (istakbar) and "insolent [junudahu] in the land beyond reason [bi-ghayr al-haqq]" (28:39; see also 22:38; 69:24). Similarly, commenting on the Qur'anic story of Moses' confrontation with Pharaoh, Sayyid Qutb made Pharaonic rule the template for tyranny and implied that a courageous confrontation with tyrants (tawaghit)—those who had usurped God's power—was needed today (Qutb 1985:3:1330–31). Some activists go so far as to demand that the pyramids be razed (Walker 1992), seeing them as an offensive representation of a moral order that was destined to perish with the advent of Islamic revelation. For these Muslims, the identity of the state is compromised by the pyramids because the state, in celebrating Egypt's archaeological heritage, appears to support the ideals of the jahiliyya. Despite the sensitivities of the activists, the government, intent on promoting the special place of Egypt in the Arab and Mediterranean worlds, has deployed Pharaonic and even Greek images—Nefertiti, the pyramids, a Greek amphitheather—on bank notes and stamps (Sivan 1990a:1007). It is not surprising, therefore, that, immediately after Sadat's assassination, the assassin linked the un-Islamic nature of the modern state with the jahili society prior to the seventh century: "I am Khalid Islambuli; I killed Pharaoh, and I am not afraid of death" (Kepel 1984:184).

[[d-f-dale-f-eickelman-and-james-piscatori-muslim-po-8.png][Fig. 6. Opposition groups appropriate Islamic imagery and Qur'anic verses to legitimize their causes. Logo of the Islamic Revolutionary Organization in the Arabian Peninsula.]]

Roy Mottahedeh has written of the outrage Iranians felt at the imprisonment by the shah's security apparatus of one young mullah (a junior religious authority) who wore the black turban of the sayyid, a descendant of the Prophet. Upon the mullah's release from detention, he was warmly greeted by the congregation of his mosque, one of whom summarized the general and politicized feeling: "It's not right, a learned sayyed like you in prison." With conscious irony, the mullah replied, "On the contrary, it's my heritage as a sayyed" (Mottahedeh 1985:265).

Symbols may also be manipulated in the contest among various nonstate Muslim groups. For example, from 1975 to 1990, Lebanon was locked in a devastating civil war, often thought to have pitted an entrenched Christian elite against a dissatisfied Muslim majority. Yet many divisions existed within the Muslim ranks, as they do within Christian ranks. Among the Shi'a, in particular, a relatively accommodationist group, Afwaj al-Muqawama al-Lubnaniyya (AMAL, the Lebanese Resistance Battalions) and a less compromising movement influenced by Iran, Hizbullah, have been bitter opponents. Both movements manipulate Islamic symbols. As figure 7 shows, the AMAL painting of a tree whose branches indicate the names of "martyrs" to the cause invokes an Islamic symbolism of shahada (martyrdom). The logo attached to many Hizbullah publications (fig. 8) depicts the arm of Husayn holding an automatic rifle, a Qur'an, and a globe arising from the Arabic words denoting "party of God." Over this is the Qur'anic verse, "For truly the party of God will be

the victors” (58:22), and beneath it, “The Islamic Revolution in Lebanon.” The effect of this representation is to suggest the divinely ordained and universal nature of the movement’s struggle and to link it with the successes of the Iranian revolution, thus distinguishing it from other groups in Lebanon in order to affirm its superior claim to sacred authority.

[[d-f-dale-f-eickelman-and-james-piscatori-muslim-po-9.png][Fig. 7. The words underneath this AMAL-inspired tree of martyrs, painted on the side of a house on the road to Sur (Tyre), indicate that it is nourished by the blood-soaked “land of the south”—Israeli-occupied south Lebanon.]]

[[d-f-dale-f-eickelman-and-james-piscatori-muslim-po-10.png][Fig. 8. “For truly the Party of God will be the victors.” Hizbullah logo, Lebanon.]]

*** Networks of Authority

The preceding discussion makes clear that no one group in Muslim societies possesses a “monopoly on the management of the sacred”(Kane 1992:9). Kings, presidents, military officers, bureaucrats (dealing specifically with religious issues and otherwise), ‘ulama, Sufi shaykhs, and nontraditionally educated intellectuals are all competitors for sacred authority. To complicate matters further, several or all may exercise authority simultaneously—one individual’s sacred authority is not exclusive of another’s. We describe below several themes common to all of them.

First, all Muslim leaders are conditioned by the modern world, and distinctions between “fundamentalists,” “traditionalists,” and “modernists” are misleading if they ignore the common ground on which they all stand. Very real differences in type of education, social position, and ideology exist among them, but none has remained unaffected by the normative and technological changes that have swept the world in this century. Chapter 2 demonstrated how the constitution of revolutionary Iran acknowledges the contemporary emphasis on popular sovereignty while reaffirming the traditional, and formerly exclusive, principle of divine sovereignty. From the perspective of analyzing Muslim politics, judgments as to whether the coexistence of these two ideas is contrived or valid are less helpful than noting the tendency to invent and reinvent tradition.

Political change is complex and differs according to political ideas and the need to persuade others to share them and their associated organizational structures. Actors always have available the vision of alternative “imagined” communities. An important component of understanding politics consists of recognizing how these alternative visions alter or replace currently dominant and authoritative ones. The fact that proponents of credos, beliefs, or ideologies may assert that their values and visions are timeless and immemorial should not

obscure the fact that they are subject to constant modification and change. Muslims assert their continuity with the past while coming to terms with a modern intellectual terrain.

As Chapter 5 will explain, Muslims use modern technology for their own purposes. That this is so is obvious and would be unexceptional but for the entrenched characterizations of "fundamentalists" as committed to a virtually unchanged Islamic law (Heritage Foundation 1984:4) or intent on creating "priestly theocracies" that would be at once "fanatical" and out of touch (Reagan 1990:409). Similar ideas also prevail among the secular Arab left. Samir Amin, for example, has declared that "rationalism [and] fundamentalism constitute two states of mind irreducible to one another, incapable of integration" (1990:184). In terms of ideas and technology, Muslims are not living in a reconstructed past, nor are they turning the clock back. As Ahmad Moussalli writes, "although [Islamic] fundamentalism appears conservative, it is actually a progressive program" that demonstrates an "understanding of science as well as its impact on the structure of society and its values" (1992:9).

Second, objectified understandings of Islamic beliefs and practices have irrevocably transformed Muslim relations to sacred authority. Of crucial importance in this process has been a "democratization" of the political process of Islam and the development of a standardized language inculcated by mass higher education, the mass media, travel, and labor migration.

Throughout this century, Muslim intellectuals have articulated a powerful indictment of the un-Islamic nature of their societies. This censure is predicated on a belief that existing authorities—political rulers and their allies, the 'ulama—have failed in their guidance of Muslims and that each Muslim has the right to direct access to and interpretation of scripture. To justify this view, writers frequently invoke the Qur'anic phrase (50:16) that God is closer to man than his jugular vein; priestly intermediaries are not required. 'Ali Shari'ati spoke disparagingly of the idea of an official clergy as "long-bearded demagogues." He said that a clergy should not exist in Islam, and he specifically criticized Iran, where the religious scholar Calim) has a higher status than persons "accomplished" (fazil) in such subjects as the Qur'an, Islamic history, and the Prophet's biography (sira). In his view, Iran's 'ulama were "second-class scholars" who have erroneously claimed hereditary and "monopolistic" powers (Shari'ati 1979:41,115—16). Habib Boulares, a former Tunisian cabinet minister, distinguishes between "the power of the 'ulama" and the "'ulama of power." The latter, in his view, inhabit the unprincipled world of compromise and have abdicated their responsibility to speak truth to established authority: "The tragedy of the Muslim world is that this religious hierarchy prefers the flickering light of the candle to the blazing flame of the spirit" (1990:69).

In southwest Nigeria, Muhammad Jumat Imam (1896–1960), proclaimed himself the "Mahdi-Messiah" in December 1941 and proceeded to construct a new movement. It has assumed the style of a Sufi tariqa (religious order), including a shrine for its founder that

has become the focal point for regional pilgrimage. Imam nominated himself as the preeminent religious authority, regarding others as lacking a knowledge of English and Arabic, which he possessed. “That such a view met with the support of many is an indication of how both the expansion of Western education and the improvements in Islamic education ... were altering the traditional criteria for leadership” (Clarke 1988:159). The spread of British colonial education, with its access to employment in the colonial government, had begun to influence profoundly Islamic education by the 1930s. Through the establishment of Islamic educational organizations such as the Ansar ud-Deen (Companions of the Religion) and the Islamic Reformation Society in the 1930s, not only were new educational forms introduced but acquisition of this kind of education also became a standard of authority rivaling seniority and virtuous character (Clarke 1988:159–63).

Third, the combined effect of criticism of the religious status quo and the belief that sacred texts are directly apprehensible has been a potent challenge to exclusivist ideas of authority, resulting in a fragmentation of sacred authority. Like Martin Luther at the Diet of Worms (1521), Muslim writers have “claimed to be attached to the authority of the Word of God alone and ... in public asserted the relative unimportance of all who claimed to come between God and the believer’s conscience” (Lienhard 1989:96). This has led to an opening up of the political process and heightened competition for the mantle of authority.

As with the peasants’ revolt (1524–25) in the wake of Luther’s dissent, the effect at times has been a rejection of the infidel state and its apparatus. Members of al-Jama’at al-Islamiyya have proclaimed Egypt the land of unbelief, and Shaykh ‘Umar ‘Abd al-Rahman (b. 1938), has lashed out at ‘ulama who appeased the government and allowed such un-Islamic practices as the drinking of alcohol, adultery, and gambling (R. Ahmad 1991:150, 160–74). The ‘ulama have been clearly forced on the defensive, declaring publicly that they act only on behalf of “true Islam” (al-Islam al-sahih), seeking to combat the errors of both those who are “ignorant” (jahilin) of Islam and those who reject it altogether (see, for example, al-Ghazali 1989:1). Since Muslims need to create a more Islamic society, they argue, it is “madness” (hamaqa) to fight over furniture before the house has been rebuilt (al-Ghazali 1989:2).

Part of the explanation for this political struggle lies in the process of objectification discussed in Chapter 2 and noted above. Because Muslims around the world possess an intensified awareness of Islamic ideas and practices, they are more assertive in their judgments of what constitutes proper Islamic conduct and who is a true believer. Ironically, from the perspective of governments whose Islamic credentials are often found wanting, the educational system they foster has been pivotal in developing this new consciousness.

The impact of modern mass education is pervasive. Students are taught about the unity of Muslim thought and practice in a set national curriculum that includes Islamic studies as one subject among many. Instead of sitting at the feet of a recognized master of traditional

learning, an impersonal relationship between students and teachers, who have become employees of the state, is stressed. Even while teaching that Islam permeates all aspects of life, the formal principles of Islamic doctrine and practice are compartmentalized and made an object of study. The traditionally educated religious authorities sometimes adapt to this form of education, but some resist it.

As an example of how intricate the basis of contemporary Islamic authority has become, the training of one qadi (religious judge) in the Malaysian state of Kedah combined traditional Islamic learning with a modem-style university education. Born into a family of religious scholars, Syeikh Marzuki received six years of primary education at his father's school, and then he attended the Islamic college in Alor Star and a Middle Eastern university. Informally given the title of shaykh in recognition of his training in the Middle East, Marzuki joined the religious bureaucracy, the Department of Religious Affairs, and eventually became a district Islamic judge. In short, he derived his authority from competence in both traditional and modern Islamic learning and the formal patronage of the state (Hassan 1993).

The beneficiaries of modern mass education are often less willing to collaborate with the state system that made their education possible in the first place. Many are attracted to Islamist groups such as the Muslim Brotherhood (in Egypt, Jordan, and the Sudan), Tunisia's Hizb al-Nahda (the Renaissance party, formerly the Mouvement de Tendance Islamique (MTI) in Tunisia), FIS in Algeria, ABIM in Malaysia, or the "Muslim Parliament" created in Great Britain in January 1992. These groups are led by "new" intellectuals, who have usually not received a traditional religious education. They include the Nahda's Rashid al-Ghannouchi, a secondary school teacher; FIS's 'Abbasi Madani (b. 1931), who has a doctorate in education from the University of London; and the Muslim Parliament's Kalim Siddiqui (b. 1931), a former subeditor of The Guardian in London.[22] The groups and their leaders have become self-conscious Islamic actors who inevitably compete for authority with other self-proclaimed Islamic actors—especially the 'ulama and, increasingly, the state.

Sufi groups as well are never apolitical. They challenge the 'ulama's exclusive control over religious knowledge and sometimes challenge the state's self-ascribed right to speak for Islam. This constitutes part of the fragmentation of sacred authority in Muslim societies. But, as we indicate throughout this book, dichotomized understandings—in this instance, Sufi shaykhs versus 'ulama—are distorting. It is often the case that eminent members of the 'ulama, even as they uphold the standards of orthodoxy, participate in Sufi movements. A celebrated example is the Sudanese Mahdi, Muhammad Ahmad. He was not only a religious scholar but also the founder of a religious order in which his descendants have continued to play a major role. Thus "the Mahdi himself was hard to classify in [a] Sufi-ulama dichotomy" (el-Affendi 1992:40).

In some contemporary societies, such as parts of West Africa and Central Asia, Sufi orders have increasingly taken on a pronounced political role. These orders—and opposition to them—contribute to the fragmentation of authority (Abduvakhitov 1993:80–81; Launay 1992:86–88; O'Brien 1988). In the late nineteenth and early twentieth centuries, Sufi orders throughout the Muslim world were seen as potential templates for transregional political action threatening colonial rule. French colonial authorities were concerned that the orders could be used by the Ottomans and rival colonial powers to weaken French rule in the Maghrib and sub-Saharan Africa. In practice, the authority of Sufi religious leaders was less than total, as indicated by the fact that many individuals belonged to more than one order and only a few orders required that their members join no other. As a whole, however, the hierarchies of dominance established by Sufi tariqas formed a pervasive and popularly understood organizational framework in some countries, including Morocco and Afghanistan. In Morocco, for example, the language and organizational structure of the protonationalists of the 1930s was adapted from religious orders (Rezette 1955).

In contemporary West Africa, the role of the Muridiyya in Senegal in organizing economic production and framing political action from the colonial era to the present is well known (O'Brien 1971,1975). Elsewhere, the influence of Sufi orders is more subtle but no less pervasive. As Launay (1992:179–95) writes, the basic hierarchical structure of orders such as the Qadiriyya, which spread throughout the region from the eighteenth century onward, and the Tijaniyya, which dates from the nineteenth century, requires a formal initiation, implying acceptance of the authority of a shaykh (religious teacher and leader) and one's own role as murid (pupil). This hierarchical link can be extended to transcend the life of the shaykh and to include more disciples than oneself. Although the authority of the shaykh lasts, in principle, throughout his lifetime, his knowledge and baraka (grace) become institutionalized and thus serve to attract and guide followers long after his death. The success of this institutionalization owes much as well to the funding that the more prestigious Sufi orders often receive from wealthy traders and industrialists, who, like philanthropists elsewhere, acquire social prestige from their charitable donations (see, for example, Tahir 1975:28, 83, 159, 165–71).

The hierarchy inherent in all Sufi orders implies that they have some degree of centralization, although a number of orders—such as Egypt's Muridiyya order—are more centralized than others. It also means that when Sufi orders lend their support to political movements or goals, as they have done on occasion, they can be highly effective (see fig. 9). The multiplicity of movements, however, means that if one order lends its support to a party or group or opposes government policy, rival orders can be manipulated to oppose it. This was clearly the case in the Sudan when President Numayri (b. 1930; r. 1969–85) exploited Khatmiyya suspicions of the Mahdiyya to bolster his rule (Cudsi 1983:52–53).

In Algeria, pilgrimages to saints' shrines and festivals associated with them were banned by the Algerian government from 1962 until 1989. The shrines and the maraboutic cults associated with them were popularly seen as symbols of refuge from government oppression. In 1989, following widespread antigovernment demonstrations and suggesting an awareness of the potency of symbolic politics, local authorities dropped the ban, in part

to counter the popularity of FIS. FIS activists, like the earlier Wahhabi movement in Saudi Arabia, saw the shrines (and their networks of supporters) as potential rivals and destroyed many of them as a way of “purifying” Algeria (Goytisolo 1994). Thus, the competition over sacred authority is not just between religious movements and the state but among Muslim activists as well.

[[d-f-dale-f-eickelman-and-james-piscatori-muslim-po-11.png][Fig. 9. Sufi orders in Egypt and elsewhere, long considered apolitical, are increasingly seen as part of a wider political resurgence. Procession of the Rifa’iyya order on the Prophet’s birthday, Cairo, 1987.]]

Even where Sufi orders are seen as weak or politically peripheral, as in Burkino Faso and the Ivory Coast, the rivalry among types and styles of authority is politically significant. At the end of World War II, Manding-speaking pilgrims returning from the hajj began to preach against local religious traditions. Exposed to reformist thought, they challenged the authority of established scholars and denounced saint worship as well as the tombs of the founders of leading scholarly families. Derided as “Wahhabis” because of their links with Saudi Arabia, they nonetheless acquired a significant following.

French colonial authorities were hostile to the “Wahhabi” movement, especially because the established local religious scholars accepted a distinction between “religion” and “politics” of which they approved and did not challenge French colonial rule. Thus, although the threat to the traditionalist ‘ulama was direct, the French interpreted the Wahhabi attack against the local ‘ulama and the appeal to Middle Eastern-trained ones instead as an indirect threat to their rule. Some saw a link between the Wahhabis and the Rassemblement Democratique Africain (RDA, the African Democratic Assembly), the major West African nationalist party. Although most Wahhabis were “sympathizers, if not militants,” of the RDA, they distanced themselves from formal support (Launay 1992:86–88). Nevertheless, the organizational structure of the local Wahhabi movement and its ability to claim transregional religious legitimacy was seen as a significant political threat to both the religious and the political establishments.

Whether from the perspective of state or nonstate actors, therefore, belief and practice in the Muslim world are now expressed in public and often in unanticipated forms. Social categories sometimes overlap and common interests may be discerned, but the competition over sacred authority increasingly pits governments, ‘ulama, Islamist groups, and Sufi shaykhs against each other.

Fourth, the contenders for Islamic authority have been predominantly male, but women are not entirely excluded. ‘Ulama and preachers of sermons (khatibs) are exclusively men in both Sunni and Shi’i traditions, but women in some regions play influential roles in Sufi movements. From the early days of Islam, female mystics, who were ascetic, celibate, and often slaves or former slaves, were prominent. Like Rabi’a al-‘Adawiyya

(717–80)—“the first true saint of Islam” (Schimmel 1975:42–60; also see L. Ahmed 1992:96–98)—many of these mystics were thought to produce miracles (karamat) and were invested with intercessionary, saintly qualities. As with their male equivalents, many of their tombs became places of pilgrimage. The shrine of Sayyida Nafisa in Cairo is a notable example, but smaller shrines, from which men are often excluded, are found in Anatolia, Iran, North Africa, and South Asia. Mary (Maryam), the mother of Jesus, figures in Sufi poetry as an exemplar of the individual incandescent with divine enlightenment, and her supposed tomb near Selquk (Ephesus) in Turkey attracts pilgrims (Schimmel 1975:426—35; Elias 1988).

Women mystics have also had defined social roles and contributed to the communal organization of Sufism. In Aleppo, there were seven “convents” (khanaqas or ribats) between 1150 and 1250, at which women congregated to pursue their spiritual mission. Wealthy women, such as Bibi Fatima in the Sind in the early eleventh century or the daughter of the Mughal emperor Aurangzeb in the eighteenth century, became patrons of convents and endowed them with food and money. In Ottoman Turkey, the Bektashiyya order accepted women as equal adepts who joined men at ceremonies and meals.

In the northern Caucasus after the Russian revolution—principally Daghestan and the Chechen Ingush Republic—women’s groups arose in affiliation with the Qadiriyya and, to a lesser extent, the Naqshban-diyya.[23] In Central Asia, small offshoots of the Yasawiyya have had women’s sections with female spiritual leaders (Benningsen and Wim-bush 1985:67–69).

In the case of Africa, “Even though women are refused access to the principal functions or public places of worship, nothing prevents them from having baraka [grace], worshipping saints, or becoming agents of a particular marabout [person thought to possess baraka and able to transmit it]” (Coulon 1988:116). Women often play significant roles in religious education, as in the schools associated with the Niassene Tijaniyya of Senegal, and, at times, in propagating the activities of religious orders. Many become involved in organizing women’s groups associated with the tariqas. Moreover, as with the Muridiyya in Senegal, even if women have no formal position in a religious order, their prestige and status are guaranteed by their inheritance, equal to that of their brothers, of their father’s baraka: “Women not only possess baraka, they also consume it; and they perpetuate it” (Coulon 1988:121).

In some cases, women have acquired their own disciples. In Mamluk Egypt, convents had shaykhas (female shaykhs) who served as prayer leaders, and in

Sind in South Asia, women became faqiras (Sufi mendicants) and murshidas (spiritual guides) (Schimmel 1975:432–33). Moreover, the Qadiriyya in Malawi was established between 1920 and 1930 through the activities of a shaykha.

In Senegal, Sokhna Magat Diop, eldest daughter of a Muridiyya leader, succeeded her father and led a branch of the brotherhood for decades. Although she did not officiate at mosques or at marriages, she was regarded as possessing “the normal powers of a khalifa [leader of a brotherhood branch]” (Coulon 1988:130). In southwestern Nigeria, the junior wife of the founder of the Mahdiyyat accompanied him as he traveled throughout the region promoting his message, which included the doctrine that—contrary to local practice—women were allowed to attend mosque prayers and were not required to veil. God, he said, had indicated that his wife, Shaykha Mahdi, was to serve as lieutenant and to succeed him. She did so, although not with universal approval (Clarke 1988:158, 164, 171–72). In the western Sudan and West Africa since at least the sixteenth century, women have become religious scholars (fakis [faqihs]), established their own religious schools (khalwas), and initiated new members into the orders (al-Kar-sani 1993:137).

As these examples indicate and Chapter 4 will elaborate, women participate, albeit to a limited extent, in the contest over authority. In Pakistan, for example, Prime Minister Benazir Bhutto (b. 1953) became a major participant in the public debate over what constitutes an Islamic order. Because she opposed a constitutional amendment that would make the Qur’an and the sunna the supreme law of the land and criticized the shari’a courts, the Minister of Religious Affairs, Abdus Sattar Niazi, proclaimed her an infidel (kafir) and “liable for the death penalty.” Bhutto replied that she believed in the Qur’an and the tradition of the Prophet, but “the law of God should not be subordinate to that framed by hand-picked individuals of the shari’a court” (“Nearer, my God” 1992:38). In this contest over boundaries, a woman politician was transformed into a symbol for those who wished to extend the control of the religious establishment and those who wished to curtail it.

Muslim women have also become “new” intellectuals and activists involved with such groups as the Muslim Sisters in Egypt. Zaynab al-Ghazali (b. 1917) is an influential writer in the tradition of the Muslim Brotherhood, and her writings are avidly followed by both men and women (see, for example, al-Ghazali 1992). When the Brotherhood reorganized in 1959–69, after a period of repression under Nasser, the major leaders of the movement regularly met in al-Ghazali’s home (Ayubi 1991:136)—a sign of the enormous respect in which she was held. Maryam Jameelah (b. 1934), an American convert to Islam who has resided for decades in Pakistan, is a prolific author on a wide range of Muslim topics (see, for example, Jameelah 1980,1982b, 1982c) with a broad international readership.

The Lower House of the Muslim Parliament of Great Britain has 24 women among its 155 members, and of its four deputy speakers, two are women. The parliament was created to deal with such issues as education, job discrimination, the availability of social and medical services, and personal status (Siddiqui 1993; “Eighth Session” 1994)— issues of prime interest to women. One deputy speaker, Adeela Rashid, affirms that the role of women in the parliament will be assertive: “The chauvinism in Islam happened because women were not educated—only men knew the laws. But now we know our rights given to us by Islam and we’re not going to be satisified with anything less” (Rabinovitch 1992). Indeed, the other woman deputy speaker, Zainab Ali, suggests that a specifically Muslim path for women is required: “We must not allow British society to influence our Islamic identity. Assimilation is not the right way: the model handed on by Western women is not acceptable to Muslim women” (“Western Women” 1992). It is clear that women are thus able to use Muslim institutions, including the Muslim Women’s Institute affiliated with the Muslim Parliament, to advance their own agendas. It is ironic, how ever, to note that, although assimilation appears undesirable, the conscious imitation of British traditions is pronounced —“Parliament” with its speaker, deputy speakers, and committee structure; and the “Women’s Institute,” a common feature of British life (see fig. 10).

[[d-f-dale-f-eickelman-and-james-piscatori-muslim-po-12.png][Fig. 10. Opening of the Muslim Parliament in Great Britain, May 1992. Muslim institutions in Europe and North America often consciously build on existing political traditions in these societies.]]

Women also participate in religious authority in less obvious, but no less important, ways. Female teachers are influential in inculcating, and perhaps subtly subverting, Islamic traditions in such women’s religious schools and colleges as Maktab-i Zahra in Shiraz, the women’s

division of al-Azhar university in Cairo, and the women’s faculties at Saudi universities.

Women are more likely than men to engage in shrine visits and occasions such as the Turkish mevlild, the celebration of the birth of the Prophet Muhammad. In these activities, they establish “an intimate link” with the Prophet. The effect of this perceived spiritual and emotive intimacy is enhanced solidarity with other women as well as the acquisition of authority—over children, other women, and, to a certain extent, over husbands and other male family members. As Nancy and Richard Tapper (1987:83) explain, until recently, the state in Republican Turkey has constrained men’s religious expression by limiting them to enacting “state-established orthodoxy.” Women’s activities, in contrast, have been relatively unregulated because of their “inferior status vis-a-vis past and present religious establishments.” The political consequence is that women acquire sacred authority: Women “preserve a domain of religious enthusiasm, reworking old forms as symbolic

vehicles for defining relations between women and men, man and God, the local community and the state" (Tapper and Tapper 1987:83, 86).

The nexus between women and sacred authority is thus firm, even though it has been overshadowed by the preponderance of male authorities. The relationship is also subtle, and considerations of family and kinship are integral—and are likely to become more important—to a conceptualization of Muslim politics that avoids the stereotypical division of "public" and "private" domains.

** 4. The "firmest Tie"

AND THE TIES THAT BIND: THE POLITICS OF FAMILY AND ETHNICITY

| I | N NORTHERN NIGERIA, a young Hausa-speaking woman, Ladi Adamu, obtained the most votes in the 1987 local government elections in Kano state (fig. 11). To the obvious discomfort of the political establishment (masculine and older), she became one of the 350 councilors in the state. Only one other councilor was a woman. Many Nigerians were incredulous that Adamu's husband would permit such a departure from a woman's characteristic role and assumed, as Ladi Adamu explained, "that a woman who speaks out must not follow tradition and must be a prostitute." While Adamu insisted that no contradiction existed between her official duties and family obligations, she was conscious of the paradox that her unprecedented conduct created and took care to frame her words and actions in conventional, deferential terms: "My mission is to emancipate women. Men cannot block my path because I follow all the religious injunctions in dress and behavior." She appeared in public only with a headscarf, and her campaign poster showed her in Fulani dress, holding a newborn daughter whose feet were dyed in henna. Explaining that this presentation conveyed that she was "a respectable married woman" (Brooke 1988), Adamu implicitly understood that the manipulation of conventional symbols endows legitimacy, especially in a changing society.

In Nigeria and throughout the Muslim world, periods of rapid economic and political transformation give new meanings to shared social understandings and tradition. Among these understandings, which evolve over time and acquire ideological meanings in the thinking of both Muslims and non-Muslims, are the controversial and emotionally charged issues of family, gender, and ethnicity. The Muslim family and the role of the woman as mother is offered as the ideal of social solidarity in many Islamic self-representations, whereas Western—

[[d-f-dale-f-eickelman-and-james-piscatori-muslim-po-13.png][Fig. 11. This 1988 photograph of Ladi Adamu, one of the first female local government councillors in northern Nigeria, displays a headscarf, Fulani]]

dress, and her newborn daughter, whose feet are dyed with henna. These elements suggest that her role of politician is compatible with that of a respectable married woman.

and some Muslim—feminist writers view the Muslim family as the embodiment of repression. These symbolic understandings contribute to the negotiation of boundaries in a moral universe, which, as we suggested in Chapter 1, is integral to Muslim politics. For Muslims, the boundaries are drawn between the good family and the corrupted one; for feminists, between the empowered woman and the subjugated one. Little is neutral in these moral debates, and they form part of the complexity of Muslim politics.

At particular issue is the utility of drawing a line between “public” and “private.” The former is conventionally thought to be the realm of politics, a realm dominated by formal institutions and men; the latter, the realm of the nonpolitical, is dominated by family and particularist identities in which women have their greatest scope for activity. However, the line between these realms cannot be so clearly drawn, and, as many have suggested, the public-private distinction is a subject of contention (see, for example, Philips 1991:92–119; Nicholson 1992; Rogers 1975).[24]

The relationship among politics, family, and ethnicity, moreover, is not fixed. In the Arab/Persian Gulf, for example, it appears self-evident that family identity determines political power. The Al Sa‹ud and Al Khalifa control the financial and symbolic resources of Saudi Arabia and Bahrain respectively. But to describe the role of such forces as family and kinship in terms of the “genes of politics” (Bill and Springborg 1990:85–136) is to assume that their influence is unidirectional. Rather than assume that family and kinship determine politics, political power may also construct family, kinship, and ethnicity, as the Bosnian case illustrates. Bosnian Muslimness is largely the result of competing Serbian and Croat nationalisms and such externally defined notions of ethnicity as those offered by the European Union and the Organization of the Islamic Conference.

Our point of departure is the concept of “elementary” identity used by sociologist Émile Durkheim (1858–1917). Avoiding any implication that the term referred to the primitive or primordial, he regarded kinship and religion as the irreducible elements for social organization and the creation of shared categories of thought in less differentiated societies,

such as those of the Australian aborigines. In more complex, multireligious and multiethnic societies, educational systems performed this role (Durkheim 1977; Cherkaoui 1976; Bourdieu 1988). While accepting the crucial role that mass education has played in transforming societies throughout the Muslim world, we hold that kinship, family, and ethnicity retain crucial influence in all societies.

Consistent with the discussion of modernization in Chapter 2, therefore, these elements of personal and collective identity—the ties that bind—have not been diminished by processes of social, political, and economic change. Rather, they persist and, in multiple ways, interact with Islam—the "firmest tie" (Qur›an 2:256; 31:22). Indeed, the Qur›an offers the view that kinship and Islamic loyalties operate on several levels. Family obligations and loyalty to one's parents and kin are morally sanctioned (e.g., 4:36), yet loyalty to the community of believers—the "brotherhood" (ikhwa)—united in submission to the one God, must take clear precedence (for example, 9:71, 49:10). The story of Abraham's willingness to sacrifice his son Isma‹il, and of Isma‹il's willingness to be sacrificed, carries resonance: The father-son relationship, while undeniably strong, was subordinated to God's wishes. In the end, a merciful God "ransomed him" (fadaynahu) and the family was spiritually transformed (37:99–111).

*** The Politics of Family

**** The Family as Microcosm of the Moral Order

Societies worldwide invest the family with sacred significance and base other interpersonal relationships, including community and political obligations, on its model. The family is a primary unit for ritual observance as well as an influential site of religious and secular education and the transmission of religious and worldly knowledge from one generation to the next (Hardacre 1993:129–40). It serves as a locus for developing notions of trust, authority, and responsibility. In short, the family—and its primary expression in domestic space, the household—is frequently taken as a microcosm of the desired moral order: "When husband and wife take up to live together as a family, they in fact lay the foundation of culture and civilization" (al-Mawdudi 1982:84). The competition and struggle over the meaning and centrality of the family thus inevitably loom large in what we call Muslim politics.

The 1979 Iranian constitution makes the political role of the family explicit in Principle 10, which states that the family is "the fundamental unit of the Islamic society" (Iran 1980:190). In many societies, phrases such as "father of the nation" or "elder brother" indicate how the metaphor of family pervades political life and is used to legitimize individual political leaders and by extension the political institutions with which they are identified (Schatzberg 1988:71–73). In his message celebrating the 1993 peace agreement, Yasser Arafat called on his "family and beloved people," his "brothers and sisters," to show unity in supporting the

accord (BBC SWB ME/1798 MED/7, September 20, 1993). King Hussein of Jordan is one of many leaders who refers to himself and is often referred to as the father of his national “family” (al-Dustur editorial, in FBIS-NES-93–217, November 12, 1993, p. 48).

President Suharto of Indonesia is often referred to as Papa Bangsa (“father of the people”). Likewise, the basic unit of many Islamist groups is the “family” (usra), and the leaders monitor their members until convinced they are fully committed to the movement (Drayf

1992:238).

The idea of the family is so central that only with difficulty do societies alter its conventional images and public forms. What James Scott (1992) calls the “public transcript” of the family role of women, and women as mothers—the stereotypes of what families are supposed to stand for—is often regarded as “ground zero” for society. Pressures to change the official and often legally endorsed view of families and family roles are often regarded with great suspicion. This is in part, as we have noted, because the family provides a powerful idiom for expressing core national and religious values (see, for example, Doumato 1992).

Until at least the nineteenth century in the West, the family was a common economic enterprise, and marriage in the Middle Ages was contracted not between principals but between households. The major family concerns were with survival and the transmission of property rights, not with nurture or shared sentiment (Bourdieu 1976). Since the late nineteenth century, however, a shift of major proportions has occurred in various parts of the world, including the Muslim world, to viewing the family—in particular the nuclear, middle-class family—as providing a safe haven from the harsh world. The family provides a domestic space in which emotion can be expressed, and support—between siblings, genders, and generations—can be taken for granted (Schneider and Smith 1973). Some writers have gone so far as to suggest that the nuclear family was particularly suitable to the needs of an industrial society (Parsons and Bales 1955), although others, including Elizabeth Bott ([1955] 1971), who studied working-class districts in London in the 1950s, discovered that over a century of industrialization and the dislocations of World War II left complex networks of extended families intact.

The defenders of traditional values often feel threatened, even shocked, by public acknowledgment of the ways in which social practice deviates from their ideal of the family. As a result, in the United States and Europe, many conservatives advocate a return to “basic values.” This is an explicit component of the Conservative platform in Britain. Conservatives thus place the family at the center of a political ideology that is intended to justify their own claim to power. In Muslim societies, as in Western ones, it is difficult to talk about changes in family values because the “family” means many things and has different political connotations.

**** The Political Meanings of Family

The implicit contrast between the politics of “traditional” societies, presumably dominated by family concerns, and the politics of the “developed” world is particularly distorting. Such a contrast ignores or understates the influence exerted by extended families in “modern” societies. Prominent examples include the Kennedys and Roosevelts in American politics, nomenklatura families in the former Soviet Union and its successor states, and the Churchills and Macmillans in Britain. Some scholars suggest that in the case of the Muslim world, the importance that family networks play is conditioned by the nature of the political system and the extent of the governmental sector’s intrusion into the economy and society (see, for example, R. Springborg 1982:243–44; Denoeux 1993:17–18). Yet, in the sense that family members in Western as well as Muslim societies follow one another in the civil service, politics, or the military, the assumption that families play a important role uniquely in Muslim societies is undermined.

As in all societies, ideas of kinship and family are not fixed but are modified in response to different situations. They are understood in the context of complementary, locally held notions of patronage, neighborliness, friendship, and ties of work and school (see Eickelman 1989a:151–78). It is only to be expected, therefore, that no one idea of family and kinship describes Muslim societies from the southern Philippines to Tajikistan, Pakistan to Morocco, Germany to Canada. The “Muslim family” is an abstract category, which, like the subject of women and Islam, “has for a long time been dominated by ahistorical accounts of the main tenets of Muslim religion and their implications” (Kandiyoti 1991:1).

In light of variations throughout the Muslim world, it is clear that the family does not possess uniform political significance. “The centrality of the family in Islam” is often assumed (see, for example, Esposito 1982:x). Indeed, Muslims—like Christians, Jews, Hindus, and Buddhists, among others—routinely affirm the great value they attach to family. Yet the political roles of the family depend on such other factors as gender, ethnicity, economics, and nationalism.

Family and kinship relations play salient political roles, but these relations are not unique to Muslim societies. Family leaders, government elites, and religious officials may promote marriages between members of different families as a means of enhancing or defending their political and social status, of gaining property and other wealth, or of extending business contacts and networks. Family networks facilitate survival where “society is fluid and political institutions unstable.” In Latin America, for example, the family network of elites “was not some relic of Iberian traditions; it was a protection racket. Without a firm institutional fabric, individual members were exposed and individual enterprise was hazardous” (Carr 1985:515). The same can be said for nonelite families.

While the ability to manipulate marriages for political ends may be limited by other factors such as race and descent, such alliances often affect the social, economic, and political status quo to such an extent that they become matters of state concern. In Saudi Arabia, the foundation of the state and much of its continuing legitimacy rests on a calculated marital alliance between the Al Sa‹ud, local amirs (princes), and what is now called the Al Shaykh—the descendants of the eighteenthcentury Islamic reformer Muhammad ibn ‹Abd al-Wahhab. In Morocco, marriages between families of senior military officers and leading merchant families are so sensitive that officers are expected to seek approval from the palace. In revolutionary Libya, the “people’s committees,” which in principle govern the country, are overlaid on a complex web of tribal alliances and intermarriage, so that national leaders operate through governmental cadres, tribes, and extended families, a combination of “meritocracy and gerontocracy” (Davis 1987:71–72). Most cadres try to sustain ties with friends in Tripoli so they can bypass or counterbalance, when necessary, the formal governmental apparatus, and marriage is a key means of securing such ties.

In Syria, ‹ulama families have intermarried in the recent past with urban trader and artisan families, and their surnames—such as al‹Attar (“perfumist”) and al-Tunji (“goldsmith”)—often reflect these unions (Batatu 1982:15). In Iran, families of the higher religious officials, the “sources of imitation” (maraji--i taqlid), have intermarried. Ayatullah Muhammad Husayn Burujirdi (d. 1961), for instance, was able to find five prior maraji‹ in his family genealogy, and the Shirazis, a prominent religious family, have had influential religious leaders in various branches of their extended family. In the period immediately prior to the Islamic revolution, all seven “sources of imitation” shared common family connections. Several of these key religious families have also intermarried with the political and economic elites, including bazaris, the military, and professionals (Fischer 1980:88–97). The effect of this interweaving of family networks is to solidify and extend political influence.

Marriages become “a means by which political and economic conflict and competition in the wider society are negotiated and managed” (N. Tapper 1991:xv, 91–93). A Moroccan example suggests how these strategies change over time. In the early 1940s, a young religious scholar from a Berber-speaking town, the deputy to his elder brother, who served as Islamic court judge (qadi) for the region, married the daughter of the region’s French-appointed native chief (qa›id). This was a marriage which attenuated tension between the chief, appointed from outside the region, and the judge’s family, influential in local politics. The marriages of both brothers forged alliances among provincial notables.

After Morocco’s independence in 1956, the older brother was appointed to the first Constitutional Council and in 1963 became a member of the first parliament. His younger brother was appointed qadi in a provincial center elsewhere in Morocco. In the 1960s—we emphasize the dates because familial strategies change over time—his oldest daughter married a schoolteacher from the same town, who eventually became a senior Ministry of Education official. His eldest son also married into a local family. Both these marriages solidified the judge’s standing in the town to which he was appointed.

In contrast, the marriages and alliances of the judge's younger children, which took place in the 1970s and 1980s, reflected postindependence Morocco's changed economic and political circumstances. A son who completed secondary school in the early 1970s (when few Moroccans went to university) secured a post in Casablanca through family connections in the provincial town where he grew up; he met his wife at his workplace, not through family ties. He later became a key administrator in a leading Casablanca holding company. A third son was selected for schooling with Morocco's crown prince; he now holds a position of considerable responsibility in an important ministry in Rabat and serves in the prince's inner circle of advisors. A fourth son, a secondary schoolteacher, lives in the same provincial town as the father (who retired from his judgeship in the early 1970s) and is active in local politics. In an earlier generation, each of these marriages would have had a calculated strategic significance. These more recent marriages show greater flexibility but indicate a range of connections that further collective family interests in both governmental and private, regional and national, spheres of influence.

Although this Moroccan example is modest and unspectacular, a similar pattern prevails in Iraq, where key positions in the regime and control of major sectors of the economy are linked to intermarriages with Saddam Hussein and ties formed in his village of origin, al-Tikrit. So sensitive has the public acknowledgment of these ties become that the Iraqi government has banned the use of names (such as al-Tikriti) which identify villages of origin. In Syria as well, the ‹Alawis, the sect to which President Hafiz al-Asad belongs, wield influence disproportionate to their demographic strength. Although conflict and tensions have occurred among the Tikritis in Iraq and the ‹Alawis in Syria and remain a source of instability, family and ethnic networks are intertwined with formal structures of power and patronage in both Ba‹thist regimes.

Similarly, in Malaysia, family relationships and marriage alliances have pronounced political implications. This is as true of Malay business elites as it is of local and national political elites. Family relationships create a moral system whereby responsibility for one's close kin is both automatic and expected: "Consanguinity as defined by Malay tradition and Islam creates broad social ties within which people should observe basic moral tenets" (Idris 1991:13). At the level of national politics during the premiership of Tun Abdul Razak (1922–76), a core group within the cabinet consisted of individuals of "high status parentage" from two families from the states of Pahang and Johore (Idris 1991:28). The Minister of Culture, Youth, and Sports was married to the Prime Minister's sister, while the Prime Minister was married to a daughter of the fomer president of the Senate. His other daughter was married to the Minister of Education. These marriages not only created family alliances but also helped to facilitate interstate connections within the Malaysian federation. In addition, the Deputy Prime Minister and the Minister of Education were also related by marriage: The sister of the Minister of Education was married to an army general whose sister was in turn married to the Deputy Prime Minister. Malay observers did not find it surprising, therefore, that this particular general was promoted over his colleagues (Idris 1991:26).

The instrumental significance that may be ascribed to the family in Muslim politics reveals only part of the story, however. Families constitute ideological clusters that carry meanings and values ascribed to them by both family members and those external to the family. The rationale of the Saudi regime is that the Sa‹ud family, as custodian of the holy places of Mecca and Medina, must constitute an exemplary Muslim family, standing at the apex of aggregations of families that collectively comprise Saudi society. It is precisely because of this royal self-representation that critics of the regime often focus their attempts to delegitimize it on alleged improprieties in the family life of the House of Sa‹ud, such as corruption and illicit sexual activities (see, for example, ‹Abduh 1990:31–36; also Jadhakhan 1992:esp. 24–38).

Parallel to a pattern seen in Western societies, the family has become the ground on which ideological battles are waged. Questions frequently heard in the religious and political discourse of Western societies include: Do the conditions of modern economic life and social mobility require adjustments in the ideal of the nuclear household in which mothers raise children while fathers earn the family income? What are proper gender relations within the household, and who does the housework and raises the children? How can poor and dysfunctional families cope, and what are the implications for society of increasing numbers of illegitimate children? Is society undermined by the recognition of homosexual rights? In the face of significant economic and social challenges, must the family unit be reaffirmed as the repository of morality in a world that has become increasingly morally diffuse and relative?

Islamists have responded to such questions much like Christian, Jewish, or other “fundamentalists” have done: Social changes that weaken “family values” are deplored and resisted. The social reality, however, is not as clear as these Islamists present. On the one hand, there has been a shift among elites and the emerging middle class from households composed of extended families—that is, more than one conjugal family and more than one generation of married couples—to separate households for each married couple or polygamous marriage. This trend has been documented for Istanbul since the late nineteenth century (Duben and Behar 1991), for Morocco since the late 1930s (Eickelman 1989a), and for the Arabian peninsula since the 1970s (alThakeb 1985; Eickelman 1991).

On the other hand, whatever patterns of formal authority households present to the outside world, household decisions emerge through internal negotiation, disagreement, conflict, and bargaining. Decisions to marry, to build a house or establish a separate household, to take in a relative, to hire a servant, or to move are seldom made by a single individual within a household. Not all household members have an equal voice, but it would be rare for a single family member to be responsible for a decision, even if the public “face” of a household might impute absolute authority to its male head (Laslett 1984:368–74). Indeed, studies of the Arab Gulf suggest that women seek out their mothers for information and advice, and a significant number of brothers and sisters rely on one another in addition to their fathers (Dhaher 1981:28–29). Moreover, the trend toward nuclear households is partially mitigated by the simultaneous tendency for extended families to live in the same neighborhood

(Eickelman 1989a:154–70) and to rely on each other for business contacts and various kinds of financial and social support.[25]

*** Women in the Muslim Political Imagination

If the family is inherently politicized, it follows that the status of women and questions of gender are also politically contentious. Islamist representations of Western and Westernized women are often unflattering, suggesting that woman's emancipation "is actually a disguised form of exploitation of her body, deprivation of her honour, and degradation of her soul" (Doi 1989:10).[26] Yet, although Islamic discussions of cultural authenticity often present the West as the morally inferior "Other," such discussions mask the real target of moral censure—local elites and their Westernized practices or ethnically distinct groups and their "deviant" conduct. Islamist discourses on women that uphold the authenticity of tradition thus seek to draw boundaries not only between the Muslim and non-Muslim community but also between the "true" guardians of community and the "internal Other" (Kandiyoti 1991:7–8).

**** Veiling

As we indicated at the outset, perhaps no issue so inflames discussions of gender relations in Islam as that of the veil (hijab) and veiling (ihtijab). From Malaysia to Morocco, the choice of dress for Muslim women, both married and unmarried, is a complex political statement (see Hoffman-Ladd 1987; Taarji 1991). In some societies it is a matter of personal choice; in others it is virtually prescribed by government, social convention, or peer pressure. In Sufi orders such as the Bektashiyya in the Balkans, it has been customary for women attending meetings with men not to veil (Norris 1993:95), but even in supposedly secular societies such as Turkey, some women wear a headscarf while attending religious ceremonies and Islamist women regularly wear the veil. As we indicated in Chapter 1, Muslim girls in both France and Egypt—although the proportion in the respective cases varies markedly—have turned to wearing the headscarf in the classroom. In cases where veiling is prescribed socially or officially, the decision to do so or not involves status. Veiling is also politically ambiguous, involving competition, not simply among groups and institutions within the state but also among international human rights organizations, minority rights groups, and nongovernmental funding agencies. For example, the social agendas, whether implicit or explicit, of a Western developmental agency and a Gulf da-wa organization would not necessarily be the same.

Arlene MacLeod writes of working women in Cairo, whom she describes as "lower middle class." By veiling, she means the adoption of the headscarf and "modest," ankle-length dresses, not the complete covering of the face (although some women do so even in Cairo). She argues that women's presence in the workforce and in public places in Egypt is not new in itself. Most lower middle-class working women in Cairo have rural origins, and in rural

areas, up to two-thirds of a woman’s time is spent in agricultural labor outside the house (1991:50). In Cairo and its suburbs, women, benefiting from the publicsector employment opportunities created in the Nasser era, engage in low-paying, routine clerical work. Many of them say they would quit their jobs if they could, but they need the income to support their families.

In the late 1970s, the adoption of “Islamic” dress was confined to Islamist students on university campuses. By the 1980s, however, a significant number of lower middle-class women had also adopted Islamic garb (MacLeod 1991:113). This had little to do with re-Islamization—their faith remained strong and unquestioned—but Islamic dress conveyed the social message that a woman could hold a job in the government bureaucracy or in a bank without abandoning her roles of wife and mother. Wearing hijab showed respect for the boundaries of a well-ordered, moral society without inhibiting social change. Veiling is thus a means for women to assert some control over the ambiguous moral situation created by new economic and social pressures (MacLeod 1991:139–41; Hijab 1988:53–55). Moreover, by blurring distinctions between lower middle-class dress and the expensive and unaffordable “Western” clothes of wealthier Egyptians, “Islamic” dress—often subsidized by Islamic groups—becomes a means of asserting respectability in difficult economic circumstances (MacLeod 1991:98–113, 133). Because of its affordability, Islamic dress empowers lower middle-class women and thus enhances their claims to status in society.

In the Muslim politics of Algeria as well, the veil has been transformed into a symbol of contention. As in Egypt, women in popular urban quarters have increasingly adopted Islamic dress, although in Algeria more than in Egypt, Islamists frequently back verbal persuasion with threats of violence. A number of secular modernists attack this trend by asserting that Islamists wish to subjugate women and remove legal rights accorded them in recent decades (Boudjedra 1992:74–87). Muslim activists (including veiled women), on the other hand, argue that only through the full implementation of Islamic norms and precepts will women be fully liberated (Aniba 1991:257; Lemu 1978:30). This debate has come to the fore with the political ascendancy of FIS and other Islamist groups.

**** Contesting Gender Boundaries

Women are thus central to the larger political and moral imaginaton, essential to the upholding of civic order and virtue. For Islamists, a woman’s role as mother—producing, nurturing, and educating children—is crucial. In response to a government request in July 1985, Kuwait’s Committee for Qur›anic Interpretations and Legislation recommended against allowing women voting rights, saying that “the nature of election processes befits men, who are endowed with ability and expertise. It is not permissible that women recommend or nominate other women or men” for public posts, such as membership in Parliament. The decree contended that women could exercise indirect influence within their families on their husbands and male relatives. The decree concluded that “Islam does not permit women to

forfeit their basic commitments” of bearing and rearing children (Associated Press 1985). Women do, however, vote in Kuwait’s neighborhood cooperative societies (jama-at ta‹awuniyya) without, apparently, forfeiting their “basic commitments.”

In Bangladesh, despite entrenched notions of female segregation (parda [purdah]), the number of women who head households and work outside the home, particularly in rural areas, is growing. Figures are difficult to obtain, but one indication of the increasing trend is that in 1982 women headed 16.5 percent of rural and 6.9 percent of urban households. There seems little doubt that this pattern has continued (Islam 1991:1), and because of increasing poverty and tension between the landed and landless, extended families have been less able to support these women. The formation of women’s cooperatives, which provide loans and training in jute craftwork, has encouraged the mobility of the poorest women, while in the past it has also tended to reinforce the class and gender domination of well-off men (Rosario 1992:106–19). But agencies such as the Bangladesh Rural Advancement Committee (BRAC), the Grameen Bank, and international nongovernmental organizations have assisted more women from diverse backgrounds to become self-reliant. By upsetting traditional economic relations and in sending their children to BRAC-run schools, they have thus directly challenged the power of village leaders, including the ‹ulama, who have had defined influence in educational matters. One consequence of this crossing of conventional boundaries has been a proliferation of fatwas against women who have been denounced as “impure” (“A Religious Backlash” 1994). At stake is the integrity of the traditional moral and political economy: “Bengali notions of honour, shame and purity are important not only to maintain a sexual hierarchy but to maintain group boundaries, status structures, distribution of power—the overall structure of domination” (Rosario 1992:179).

Women Islamist intellectuals and activists often contribute to the defense of traditional female roles. Maryam Jameelah, who has been closely associated with the Jama‹at-i Islami in Pakistan, wrote: “Although I believe that every woman should be educated [to] the fullest sense of her intellectual capacities, I certainly question the advantages of taking women out of the home (particularly those with young children) to compete in business offices and factories with men and substituting nurseries and kindergartens for a home upbringing” (Jameelah [1969] 1982a:17). Zaynab al-Ghazali, a leader of the Egyptian Muslim Sisters, an organization closely allied with the Muslim Brotherhood, argues that women may be educated, but their primary duties are as wife and mother. She also argues that society is harmed if mothers do not remain at home until their children mature (Hoffman 1985).

It is precisely because women are placed at the center of civic order that the contest over family legislation has so often become a matter of high politics.[27] In Pakistan, for example, the controversy over Islamization has focused on such matters as women’s rights in divorce, inheritance, and legal testimony, and sections of the conservative religious establishment have been pitted against the Women’s Action Forum and women’s professional associations in attempting to reform shari-a-based family law. One political organization of ‹ulama, Jamiyat Ulama-i Pakistan (Society of Pakistani ‹Ulama), has made family law issues central to its program. In the early 1980s, the government of Zia ul-Haq (r.

1977–88) proposed several reforms that were opposed by educated professional women as restrictive and un-Islamic. One key reform was the qanun-i shahadat, the law of evidence, which would have equated the testimony of two female witnesses to that of one male. Women were also to be excluded from cases involving the hudud (Qur›anically prescribed punishments) (Weiss 1986). Moreover, fierce debate has ensued over whether the Muslim Family Laws Ordinance of 1961 should be repealed. It has irritated many Islamists because of its relatively liberal provisions on women's rights in marriage and divorce (Patel 1986:91).

Muhammad Reza Shah Pahlevi, influenced by his sister, Princess Ashraf, promulgated Iran's Family Protection Act of 1967, which strengthened women's rights, especially those involving marriage. This act was technically repealed and recast in even more liberal terms in 1975, yet by then it had become a focal point of opposition. Ayatullah Khomeini targeted it as symptomatic of the regime's decadence, and soon after he came to power it was suspended (Keddie 1981:179– 80, 240, 266). Ironically, some of the reforms first proposed by the shah have been reintroduced by the Islamic Republic since 1991—a reinvigorated family planning program, state-sponsored prenuptial contracts that give women the right to initiate divorce proceedings, and greater opportunities in the workplace and in higher education.

In the period from 1915 to 1916, the Sudan became the first country after Ottoman Turkey to allow women to institute judicial proceedings for divorce. After Sudanese independence in 1956, shari-a and civil court judges were at first exclusively male, but in 1970 a woman, Najwa Kamal Farid, was appointed to the shari-a court, followed by three others in 1973 and 1974, with more women in the civil courts.[28] Despite the amalgamation of the civil and shari-a courts in 1980, coups, and Islamization programs, women remain in the Sudanese judiciary, principally hearing cases in the appeals courts. In part due to pressures from the Sudanese women's movement, liberalizing reforms were introduced in the 1960s and 1970s allowing women the right to contract for themselves in marriage (1960), increasing maintenance (nafaqa) payments, and liberalizing the law regarding divorce because of cruelty (Fluehr-Lobban 1987:50, 100–102, 138, 278). Sudan's first Permanent Constitution, adopted in 1973, also granted equal protection to men and women, as well as equal protection for adherents of Christianity and other "heavenly" religions (Fluehr-Lobban 1990:618). Although the Permanent Constitution has never been formally rescinded, Sudan's radical Islamization beginning in 1983 rendered many of its provisions moot.[29] Nonetheless, in January 1990, six months after an Islamist military government seized power in the midst of civil war, it convened a Conference on the Role of Women in National Salvation. This conference resulted in a 1991 code of personal status that, although only minimally innovative, reaffirmed women's increased authority in marriage and other improvements of women's status (Fluehr-Lobban 1994:133–35).

In Morocco, women work in both the state and the nonstate sector and are strongly represented in higher education. In an August 1992 speech, King Hassan, after encouraging women to participate in the municipal and parliamentary elections, said: "I have understood and listened to your complaints concerning the Mudawwana" (the 1958 shari-a-based legal code that is the basis for Moroccan laws regarding

marriage, family, and inheritance). It was within his powers, he said, to change this code, and he invited women to write to him and to a judicial committee entrusted with revising it. In spite of the promises of change contained in the king's speech and the fact that a process of wider consultation was set into motion, the alterations appeared to some Moroccan legal specialists as insignificant ("Recevant" 1993; Mayer 1993:93–105).

Perhaps because family law is one of the most conservative of all institutional spheres, the changes that have occurred in it have met with more resistance than major transformations in other spheres of activity that affect women throughout the Muslim world. Education is a pertinent example. To be sure, the gap between men's and women's education has grown in some places, such as among Afghans after the Communist coup in 1978 and the Soviet invasion in 1979. Reacting to the needs of the resistance as well as the government's mandatory literacy campaign for both men and women, which appeared to many an unwarranted intrusion into private lives, the number of schools, and specifically the number of female students, declined significantly. Moreover, among the 2.8 million Afghan refugees in Pakistan, of whom 75 percent were women and children, girls constituted only about 7 percent of the total student population in primary and about 3 percent in secondary schools (Majrooh 1989:89–92). Although there continues to be a gap between women's and men's access to higher education in virtually all Muslim societies, this gap is closing in wealthier countries, and in others it has narrowed dramatically in recent years (Eickelman 1989a:198–200).[30]

In Iran as of 1994, 30 percent of government employees were women, and 40 percent of university students were women, up from 12 percent in 1978 (Ghazi 1994). In the past few decades, women have thus made significant, but uneven, strides in access to education and health care, and to participation in the labor force. Women also increasingly participate in formal and informal political processes, whether these involve organizing community relations with the occupying forces during the Iraqi invasion of Kuwait, transforming the rural economy in Bangladesh, campaigning for elections in Turkey, or demonstrating against the ban on women driving in Saudi Arabia. In Iran, Faezah Hashemi, the eldest daughter of President Rafsanjani, acted as a spokesperson for Iran's women's movement during Women's Week in 1994 (Ghazi 1994).

Hasan al-Turabi claims that women in the Sudan "have played a more important role in the [National Islamic Front] than men recently" in all aspects of the party, in Parliament, and as ministers and judges. "Segregation of women is definitely not a part of Islam" (al-Turabi 1992:58). Observers may dispute his depiction of the improved situation of women in the Sudan, but it is clear that women elsewhere in the Muslim world—Morocco, Jordan, Egypt, Malaysia, Turkey, Bangladesh, and Pakistan—do hold political office. In the case of Pakistan, Turkey, and Bangladesh, they have served as prime ministers.

The emergence of Muslim women into positions of formal political responsibility is occurring in spite of one interpretation of Muslim tradition that argues that women cannot lead an

Islamic state. Abu-l A‹la al-Mawdudi of Pakistan (1903–79) insisted that the head of an Islamic state must be male. He invoked a hadith that he rendered as a “nation would not prosper which hands over the reins of its government to a woman” (al-Mawdudi 1983:60). This hadith, found in alBukhari’s collection (n.d.:228), refers to the ascension of Khosrow’s daughter to the Persian throne in the pre-Islamic era. It is more accurately translated as “A people who entrust their affairs to a woman will not prosper.” Al-Mawdudi’s translation, supporting his conclusion that only male rulers are legitimate in an Islamic state, thus conveys a particular ideological construction.

Because of views such as al-Mawdudi’s, even women who are successful in acquiring formal political roles are careful to portray themselves in ways that suggest they are not radically challenging traditional gender roles. Benazir Bhutto, a member of one of Pakistan’s leading political families and at times its prime minister, has avoided photographs that depict her shaking the hands of men in public, and for some time she has preferred to appear in photographs which emphasize her roles as daughter and mother, notwithstanding the bitter political struggle that erupted into a violent clash between her supporters and those of her mother in early 1994 (Kamm 1994).[31] In Jordan’s 1993 parliamentary elections, Toujan Faysal became the first elected woman in the lower house, while two women were appointed to the senate. Faysal, a former television journalist, was defeated in the parliamentary elections of 1989, when the Islamists vociferously opposed her and accused her of apostasy. After her 1993 victory, Faysal said, “The Islamists fear me because I can fight them from the inside. I know the Qur›an as well as they do.” Yet in public and in photographs, as was seen in the example of Ladi Adamu in Nigeria, Faysal takes care to emphasize her role as mother (Ramadan 1993).

**** Women’s “Place” and Public Life

A key dimension of Muslim politics is the contest over the meanings attached to “women” as a symbol. The underlying belief, common to all ideological formations, is that women must remain “in their place” for political and social harmony to prevail. Unlike social conservatives, liberals and feminists, however, believe that women can remain “in their place” and still have roles equal to men in all spheres of activity. Throughout Islamic history, they point out, women have exercised considerable political influence, sometimes as rulers (Mernissi 1990; Peirce 1993). Analyses that assume that women have simply played subordinate roles thus need to be challenged. Indeed, some Muslims have argued that “no hope is possible for Muslim societies without the positive participation of women, whose full rights have been assured by religion” (Elmandjra 1992:172–73). Others argue that the Qur›an “illustrates explicitly the correlation between the female and bearing children,” but it does not describe the “psychological and cultural perceptions of ‘mothering’” as “essential created characteristics of the female” (Wadud-Muhsin 1992:22). Wadud-Muhsin argues that the liberation of women began with the Prophet’s message in seventh-century Arabia and did not end at his death, and that God spoke equally to men and women. “If a woman was not a judge (qadiya) during the Prophet’s lifetime or did not attain a political position, this does not mean that she was forbidden from doing so for all time” (Shahrur 1992:593, 596). Such arguments jettison the centuries of legal interpretation developed by

male Islamic scholars and suggest that Qur›anic texts must be interpreted in each generation (Wadud-Muhsin 1992:12; Shahrur 1992:44).

Notwithstanding the support that these reformist interpretations have acquired, a more prevalent view, echoed throughout the centuries of Islamic history, argues that the just Islamic society exists in a delicate balance (mizan) or complementarity of genders. “Nature has made men and women different, adapted to different natural functions, and capable of different duties in life.... Thus cooking, laundering, shopping, washing-up are the responsibility of one person” (Tabandeh 1970:40–41). As the wife of Iranian President Rafsanjani, Effat Marashi, said of her domestic relationship: “The entire responsibility of the children and house rests upon my shoulders,” leaving her husband free to fight “for the cause of Allah” (“Tales of Love” 1993).

If women do not adhere to this moral order, society runs the risk of degenerating into fitna, a term which means temptation or, more importantly, rebellion, social dissension, or disorder. A saying of the Prophet, which appears to have been codified between the late eighth and the early ninth century, holds that there is “no fitna more harmful to men than women” (cited in Spellberg 1991: 51). Women are so potentially powerful that they are required to submit to their husbands,[32] segregate themselves from men to whom they are not immediately related, and restrain themselves, lest the pattern of gender relations, which is at the core of a properly ordered society, be overturned. One Sufi order in Turkey, the Aczmendis, decrees that women cannot be present at a dervish lodge because “it is forbidden for women to be in a place where men are present” (Yilmaz 1994). In Nigeria, Ibraheem Sulaiman, a “new” Muslim intellectual, writes of the role of women in the Sokoto caliphate, which prevailed in West Africa from 1817 to 1837 and represents for him the ideal Islamic state: “In so far as women are seen by most men as symbolizing the ultimate in joy and comfort, women could play a key role in stemming the tide of social decay, or accelerating it. In fact, society as a whole is, in the ultimate sense, saved by the self-restraint and moral discipline which women display” (Sulaiman 1987:130).

The view that women’s assertiveness may be tantamount to fitna is consistent with the elaboration of a public-private dichotomy in which the role of women is restricted to the private, nonpolitical realm. However, the public-private dichotomy is misleading for several reasons (compare Philips 1991:119). First, women may play strong, even central, roles in modern society provided that they work through men. Even in Saudi Arabia, women operate in finance, banking, and transnational charitable organizations, often facilitated by their male relatives, and can teach and practice medicine. Consistent with his view that Islam is inherently political, Ayatullah Khomeini commemorated the role of women in the Iranian revolution, while reaffirming traditional male-female relationships: “They confronted a despot with a clenched fist while holding their child in their other arm, thus ensuring the success of our revolution” (Khomeini 1988:6). In Indonesia, the Lembaga Konsultasi & Bantuan Hukum Untuk Wanita & Keluarga (LKBHUWK, the Institute for Consultation and Legal Aid for Women and Families) in Jakarta is committed to stimulating “the legal awareness [of women] of [their] social rights and duties” and to obtaining for them “equal opportunities in the areas of education and employment.” Although Muslim “women have

the equal status and position as men, both spiritually, intellectually, socially, as well as morally," they are not to "forget their predestinational status as wom[e]n"(Yamin 1984:7–11; compare LKBHUWK n.d.). The Institute of course is careful to seek the approval of the ‹ulama—its sponsors include the Majelis Ulama Indonesia (the Assembly of Indonesian ‹Ulama), and its office is located in a mosque.

Second, through complex social networks of their own, women may entertain friends and kin and thereby cement social ties and serve as channels of information and communication. In times of social tension, these channels of communication may help to resolve disputes. In the Iranian village of Aliabad in 1978–79, for example, women acted to defuse a difficult situation: "Because women could be seen as somewhat removed from a conflict and because they had lower status, they were used as messengers or intermediaries in delicate sociopolitical negotiations" (Hegland 1991:222). The consequence of women acting in such roles is that the political goals of the father or husband may be advanced.

In addition, women's contribution to achieving the goals of the extended family is salient. In the case of Oman, women and men jointly further the aspirations of their family clusters (hayyan) in maintaining and extending claims to status, property, and education (C. Eickelman 1984:80–111). Extended families thus provide women with access to authority, and, in this regard, family/nonfamily distinctions are more useful than private/public ones.

Finally, some social institutions erode distinctions between the private and public. The diwaniyya in the Arab Gulf, a regular, informal gathering of relatives, professionals, members of the same religious group, workmates, or those sharing political goals, is not limited to extended families. A wide range of topics is usually discussed, such as sports, literature, and cars, and political discourse certainly does not dominate. But because they constitute the arena for nonstate activity and discussion, interlocking networks of diwaniyyas form the backbone of civil society. Male and female diwaniyyas have existed side by side (although male ones have predominated in the past), but with women increasingly educated (and to higher levels) and their greater participation in roles outside the household, women's diwaniyyas have become more common. A few diwaniyyas now include both men and women. In the parliamentary elections of 1992, the Kuwait Democratic Forum, which advocated greater rights for women, helped to break down gender divisions by inviting two women to speak in a predominantly male diwaniyya setting.

Although the barriers between men and women in a society such as that of Kuwait remain formidable, "the diwaniyya is the means by which the public space enters the home" (Tétreault 1993: 280), and it thus qualifies the idea of a public-private dichotomization corresponding to male-female relations. Neither public nor private can adequately describe its complex functions. The term diwaniyya is limited to the northern Gulf

states, but such social and discussion circles are also common elsewhere, including in Iran, where they are simply called “circles” (dawras).

The social picture, as we can see, is far from settled. Precisely because of this uncertainty, the family, and the role of women in it, is invested with diverse ideological meanings. The regime, established religious authorities, and counterregime Islamists all claim to be the defender of family integrity and of the roles and rights of women in an Islamic society. In so doing, each makes the ideas of family and women pivotal to contemporary Muslim politics.

*** Ethnicity

Similar to the ways in which family and women have become subject to explicit ideological contention, ethnicity, another “elementary” identity, is controversial and carries various political meanings. The controversy is sometimes compounded by an explicit linkage between gender and ethnicity. In a village in Selangor in Malaysia, a young religious student who had studied at al-Azhar in Cairo delivered a sermon in 1979 that drew a connection between the defense of women’s traditional domestic and family roles and the promotion of Malay ethnicity. He said that the problems affecting Malays, such as drug use and the intrusions of television, had at their root new social roles that took women outside their traditional duties. Wage labor was particularly objectionable because it exploited women and encouraged baser instincts. “This call for strengthening of the Malay race required women to adhere to a stricter, Islamic version of male authority and of women’s roles as mothers and wives” (Ong 1990:268).

As with family and gender, however, ethnicity influences political events, but ethnic relations are themselves shaped by political and other considerations. Here, too, the relationship between Muslim politics and “the ties that bind” is reciprocal. Many Muslims argue that the ties of Islamic community created through common submission to God supersede those of ethnicity and kinship. As the Qur›an says, God distinguishes believers only by their piety: “The most honored among you is the most pious (atqakum)” (49:13). The idea that Islam and ethnicity are antithetical and antagonistic also appears in the thinking of Islamists such as Egypt’s Sayyid Qutb, who consigns ethnicity, tribalism, and nationalism to the category of the jahiliyya. In using this term, which originally referred to the pre-Islamic “age of ignorance,” he powerfully criticizes the validity of particularist ties (Qutb 1981:159).

Western social scientists have also politicized ethnicity, by which most mean “the way individuals and groups characterize themselves on the basis of their language, race, place of origin, shared culture, values, and history” (Banuazizi and Weiner 1986:2–3). Ethnicity is often thought to be a matter of birth because of the notion of shared descent. The “liberal expectancy” was that ideas of the territorial state and nationalism would displace ties of kinship and ethnicity as the sources of political community. Marxists assumed that

“proletarian internationalism” would displace ethnicity and that class would determine identity (Moynihan 1993:27–28). Common to all views is the transformation of ethnicity into an ideology.

Ethnicity is an enduring social and political force, constructed and reconstructed as circumstances and contexts change. Yet, ironically, the post-Soviet world order has given rise to virulent ethnonationalisms that remind us that political boundaries are not fixed. Rather than simply determining the nature of political organization, as “tribe” was thought to determine politics in some societies, ethnicity is formulated in relation to diverse political and social forces. “External” opposition—the opposition of one social group to others—is paramount among them. To take a familiar non-Muslim example, African “tribes” were created in the context of colonial rule. One scholar went so far as to say, “The Luyia people came into existence between approximately 1935 and 1945.... It was clearly due to the reaction of younger and more educated men to the exigencies of the colonial situation” (Southall 1970:34). This objectification of the tribe—in which both colonial authorities and politically active Luyia colluded—has its parallel in the objectification of ethnicities in Muslim societies. The formation of identity is sometimes inadvertent, however. Elsewhere in Africa, for example, Sufi religious orders—formally intended to advance universal Islamic identities—have at times promoted the rise of ethnic consciousness. This has been the case with the Muridiyya and the rise of Wolof ethnicity in Senegal (Launay 1992:237).

<right>

In Saudi Arabia, Oman, Yemen, the Gulf states, and Jordan’s East

</right>

Bank, notions of ethnicity and tribalism are virtually indistinguishable. They are usually framed in terms of genealogy, although claims of tribal descent are better thought of as invented traditions (discussed in Chapter 2), rather than as historically verifiable accounts. Indeed, the fact that peoples and groups can change tribal and ethnic affiliations under certain conditions indicates the flexibility of these supposedly fixed identities. The Kwatzba, for example, left their original tribal grouping to join the Rwala, located in Jordan, Saudi Arabia, and Syria. Although this move did not fit into the existing Rwala genealogy, tribal history has been reformulated to include them as part of the larger tribal confederation (Lancaster 1981:24–25). In another example, the Al Sa‹ud, a house (bayt) of the Masalikh subdivision of the Awlad ‹Ali tribe of the ‹Anayza confederation, have at times been invested with a political and national role. As the Al Murra in the Empty Quarter said at the time of King Faysal (d. 1975): Al Murra Al Faysal, “Murra people [are] Faysal people.” They distinguished between the dawla (state), by which they meant the bureaucracy, and the hukuma (government), by which they meant the Al Sa‹ud, whom they regarded as the “rightful leaders of the Islamic nation” (Cole 1975:109). [33]

In a similar manner, groups such as the Sindhi- (and Arabic-) speaking Shi‹i Liwatiyya of coastal Oman have also claimed Arab descent, explaining their “temporary” loss of Arabic (and tribal identity) by centuries of residence on the Indian subcontinent. With India’s independence in 1947, the Liwatiyya in Oman were given the choice of becoming Indians or Omanis. Most chose Omani nationality, recognizing the precariousness of their position if they chose Indian nationality but resided outside of India. Once this choice was made, Liwati intellectuals began to “discover” Arab antecedents and one produced a manuscript purporting to document these Arab origins. In addition to the Liwatiyya, ex-slaves (Arabic, khuddam) attached to tribes and ruling families throughout the Arabian peninsula and other groups lacking tribal descent have traditionally had an inferior social status, as shown by occupation and the lack of intermarriage with other groups, but modern economic conditions are rapidly eroding these distinctions. To some Arabs in the peninsula, visible African features may imply descent from slaves, but it may also indicate descent from earlier ruling families that possessed slave concubines.

As with the Liwatiyya example, contemporary Arab identity suggests that ethnic claims need to be placed in historical context. Many Arabs assert that they are a “race,” although for centuries populations have mixed and intermarried throughout the Arab world. Despite the claims that first appeared in the nineteenth century that the Arabs constituted a nation, although divided politically, Arabs still maintain that they are unified in language and culture. Many regional dialects of Arabic, however, are mutually unintelligible. Arabs from Saudi Arabia and the Gulf states understand colloquial Moroccan Arabic only with difficulty, and vice versa. The spread of mass higher education throughout the region since midcentury has facilitated communication among Arabs from different regions through “modern standard” Arabic, which is modeled on classroom and the broadcast media. Still, major differences of dialect and situational identity remain. One is not just Muslim in the Middle East, but also Arab, Berber, Nubian, Circassian, or Kurd.

The ways in which Muslim identities are shaped and reshaped are strikingly illustrated in the case of Bosnia. Throughout the Balkans, Sufi orders like the Bektashiyya, the Khalwatiyya, the Naqshbandiyya, and the Qadiriyya provided significant frameworks for religious identity from the sixteenth through the early twentieth centuries (Norris 1993:82–137; compare Popovic 1986). In the period of the Titoist Yugolsav state (ca. 1945–91), religious identity and nationality were legally separate, although in practice, Catholic Bosnians were officially Croatians and Orthodox Bosnians were Serbs. Until 1961, individuals could register only as Serbian, Croatian, or undeclared. With the 1961 census, however, Muslims were allowed to register as Muslims for the first time. In the Bosnian constitution of 1963, they were accorded the status of an ethnic “nationality” (nacija), and in 1964 the Communist party in Bosnia “declared explicitly that Muslims had the right of selfdetermination” (Lockwood 1975:27). State and party action helped to formalize Muslim identity as an ethnic one. Later events sharpened the Bosnian dimension of this ethnicity. By the mid-1980s, two contradictory trends had emerged. One was a renewed emphasis on common Muslim practices—distinctive dress for women, more public celebration of religious festivals such as Ramadan, participation in the pilgrimage, and election of the first non-Bosnian religious leader for all Yugoslavia (ra›is al--ulama). The

other trend, following the rise of antiAlbanian sentiment, was the incipient distinction between Bosnian and non-Bosnian Muslims (Sorabji 1988, 1993).

The collapse of the Yugoslav state and the advent of civil war in 1992 added a further defining dimension. Partly as a result of ethnic designations formulated by the European community and partly as the result of support from Muslims elsewhere in the world, the identification “Bosnian Muslim” was solidified. The transformation of a Muslim identity in Bosnia into a Bosnian Muslim ethnicity was thus in large measure due to an “architecture” of external groups and pressures (Berman and Lonsdale 1992:330–32).

The phrase “Muslim ethnicity” may appear to conflate two separable kinds of identity, yet our use of the term is deliberate. The Malaysian constitution (Article 160:2), for instance, specifies that Malays are Muslims (see Mutalib 1990:2, 9, 31). In other cases in which the constitutional order is not so clearly prescriptive or has not yet been defined— as in Bosnia and, as we shall argue, in Pakistan—identities and selfdesignations have been transformed as circumstances have changed, sometimes dramatically. Anti-Muslim sentiment may heighten a sense of Muslim identity, but this at first may not be synonymous with an ethnic identity. Yet, as events unfold, religious and ethnic attachments may begin to converge. A Muslim ethnicity may emerge.

The transformations of identity that occurred among Pakistani Muslims suggest that a divergence of religious and ethnic ties may also occur. In prepartition India, Muslim intellectuals such as Muhammad ‹Ali Jinnah (1876–1948) accented an Islamic identity to distinguish themselves from the Hindu majority. Pakistan, a romanticized “land of the pure,” would demarcate the boundaries of an Islamic realm juxtaposed to secular India. After partition in 1947, however, “Muslim ethnicity ... outlived its original purpose” (Alavi 1986:43), with Jinnah, now the father of the nation (Quaid-i-Azam, “the Great Leader”), openly articulating his secularist suspicions of an Islamic state or particularist identities. Punjabis became the dominant ethnicity in Pakistan, while Sindhis, Baluchis, Pathans, and Bengalis pressed their claims as well. In the particular case of Bengali Muslim society, “the weaknesses of a[n elitist] religious identity which provided at best an unsatisfactory basis for an incomplete cohesion in society” led to the creation in 1971 of Bangladesh as a “nation state on the basis of a separate linguistic-cultural identity” (R. Ahmed [1981] 1988:xi–xii).

Although Pakistan’s official ideology encourages the preeminence of Islamic identity, ethnic and tribal identities continue to be a major force in national politics. In November 1991, a friend of Benazir Bhutto was raped by a gang that, the victim said, was sent by the son-in-law of the president. Bhutto claimed that the motivation for the rape was political intimidation directed at her, and she and various women’s groups demanded that Islamic justice be applied. State institutions proved irresolute in dealing with what quickly became a major public scandal, however. Although families usually conceal the “shame” of rape, in this case the victim’s father and her supporters turned to a convocation of the family’s tribal

leaders (jirga) to elicit support in pressing her case to the authorities (Pitchford 1991; Rashid 1991a; Hussain 1992).

Ethnicities are thus also constructed in part by an “internal architecture” of rivalries within collectivities (Berman and Lonsdale 1992: 346– 50), but it would be a mistake to draw too sharp a distinction between “internal” and “external” factors. In the case of the Kurds in northern Iraq, clan divisions organized around traditional leaders (aghas) such as Mustafa al-Barazani (1903–79) provided one framework for loyalties and alliances. Another was provided by younger, urban professional leaders such as Jalal Talabani. These social cleavages crystallized into political parties, but the ostensible ideological differences between the parties—called at various times the Kurdish Democratic party (KDP) and the Patriotic Union of Kurdistan (PUK)—were more apparent than real. Often internal Kurdish rivalries eclipsed Kurdish opposition to the Ba‹thist (and therefore Arab nationalist) government in Baghdad. In addition to the internal social rivalries, external sponsors such as Iran, Syria, the United States, Israel, and the Iraqi government exploited the differences among Kurdish factions and helped to create rival senses of Kurdish nationalism. The picture is further complicated by many Kurds, especially migrants and the educated, who identify themselves as Arabs (or, in the cases of Kurds in neighboring Turkey and Iran, as Turks or Persians). Others stress their identity as Muslims, as opposed to secular Kurdish nationalists (Van Bruinessen 1992a:54).

This process by which a Muslim ethnicity is affected by internal rivalries is clear in the case of the southern Philippines, where Moro nationalism has been in an uneasy alliance with Islamic identity. Muslim Moros constitute 4 to 7 percent of the population of the Philippines, but they are divided into three major and ten minor ethnolinguistic groups. Of the twenty-two provinces of the southern Philippines, where most Muslims live, they constitute a majority in only five. Although some Muslim notables argue that the Muslims of the Philippines have worked toward autonomy since the Spanish colonial era, most historians note that rivalries among the various traditional Muslim rulers largely coincided with a peaceful coexistence with the Spanish. During the period of U.S. colonial rule (1898–1946), however, common schooling for the sons of Muslim notables (datus), which paradoxically introduced notions of Islamic tradition and history, fostered an early sense of self-awareness as Muslims (McKenna 1993). This identity became intensified in the early 1950s, when notables assumed control of American war-damage payments. These elites, promoting their own authority, channeled much of the money into mosque construction, which encouraged a heightened religious identity but not an overtly politicized one.

Moro nationalism, based on a common Muslim identity, began to emerge out of the several local, ethnolinguistic identities in the region. This “Moro-ness”was given concrete expression with the imposition of martial law in September 1972, partly in response to a separatist rebellion in the south. Strengthened Muslim identity occurred as an indirect result of transnational Muslim connections, which provided Filipino Muslims with work opportunities in the Middle East, where they acquired some knowledge of Arabic, formal training in Islamic studies, and financial assistance. From 1955 through 1970, the government of Egypt provided more than two hundred scholarships for Moros, many from datu

families, to study the religious sciences. These students began to return to the southern Philippines in the 1960s. Gradually, they acquired wider political and religious roles, and by the 1980s they had become firmly linked to the separatist movement (McKenna 1993). Many members of the Moro National Liberation Front (MNLF) central committee “were recruited from among Moro students who were studying in various Arab universities at the time” (Che Man 1990:128). The consolidation of the separatist movement also coincided with material support from the Libyan government.

Members of the traditional elite, disadvantaged as a result of the central government’s land reform and modernization program and partly educated in the Middle East, stressed the idea that Moros were fighting for the cause of Islam. Thus a Moro-Muslim identity was promoted, and the major groups used Islamic symbolism to recruit and mobilize followers. The MNLF emphasized the obligation to participate in both the Islamic jihad and bangsa (identifying with one’s ancestors). The Moro Islamic Liberation Front (MILF), for its part, declared that “the ideology of the MILF is La illaha illa Allah Muhammad rasul Allah (‘There is no God but Allah and Muhammad is the messenger of Allah’)” (Che Man 1990:88). This language indicates the importance of symbolic notions such as jihad and the shahada (the declaration of faith) to Muslim politics. Here, Islamist groups, rather than the state or religious authorities, constitute the institutions that control symbolic production and its articulation.

Despite the accent on a Muslim-Moro identity in the Philippines, significant family differences account for the formation of separate nationalist groups. The MNLF (formed in 1969) represented more secular and nontraditional tendencies, although it also contained elements of the traditional religious leadership and aristocracy. Many of its leading cadres received military training in Malaysia. In contrast, the leadership of the MILF (formed in March 1984) was dominated by the religiously educated, many of whom had become increasingly discontented with what they regarded as the leftist agenda of the MNLF.

The general population has remained divided by class, subgroup, language, and territory, such as the divisions between the Tausug and Sama in one area of the south. These divisions and rivalries complicate the search for an all-encompassing Moro-Muslim ethnicity (McKenna 1993; Horvatich 1993:35). All subscribe to the idea that Islam constitutes a vital component of their identity, and followers are aware of being “discriminated against as Muslims” (Che Man 1990: 89). There is, however, substantial disagreement over the degree of Islamization of the nationalist movement, the desirability of autonomy within the Filipino state or independence from it, and the extent of reliance on external patrons.

As the politicization of Islamic identity in the Philippines suggests, the instrumental importance of Muslim ethnicities may increase in situations where Muslims constitute a minority. Governments, for example, may use ethnicity to advance foreign policy goals. In China, the government allows Muslims to participate in the pilgrimage to Mecca as a way of currying favor with Muslim states such as Saudi Arabia and of securing construction and

military contracts. The government also seeks to present a favorable image of its treatment of Chinese Muslims by refurbishing Muslim shrines, mosques, and religious buildings and by encouraging the visits of foreign Muslim delegations to such institutions as the China Islamic Association in Beijing (Piscatori 1987).

Ethnic groups within a society may also use ethnicity in their competition for status and entitlements. The population of the Hui and nine other officially recognized Muslim groups increased by an average of 30 to 40 percent between 1982 and 1990, as opposed to a mere 10 percent increase for the dominant Han population (Gladney 1994c:186). These officially recognized minority groups have used their Muslim “nationality” (minzu) to press their claims for greater recognition of Muslim rites and legal practices from the Communist government in Beijing. For example, Muslims are permitted to marry at age eighteen, whereas the age for Han Chinese women is twenty-five and for men, twenty-eight. Muslims are also exempt from government pressure to cremate the dead. In addition, they receive time off from work for religious festivals, and some workplaces provide separate eating facilities (Dreyer 1982–1983:52–53).

In 1989, the publication of a book that discussed the sexual customs of Muslims inflamed Muslim sensibilities. Predominantly Hui Muslim students, joined by representatives of other Chinese Muslim nationalities, staged protests in Beijing and elsewhere. On May 12, some three thousand protesters marched in the capital, and significantly larger demonstrations occurred in the provinces. Unlike the student pro-democracy movement that was to culminate in the Tiananmen Square protests a month later, the government on June 4 provided the protesters with transportation, banned the offending book, and publicly burned copies of it. The official media stressed that the Muslims’ protests were legitimate because they were conducted by legally recognized representatives of a world religion (Gladney 1991:1–7).

There have been more violent Muslim protests in China when the government was less accommodating. In 1975, toward the end of the Cultural Revolution (1966–76), when mosques were closed and religious activities proscribed, villagers in Shadian, in southern Yunnan, reopened their mosque and resumed congregational (Friday) prayers. Branding this as “counterrevolutionary,” the government dispatched troops. Many casualties resulted, and eleven Muslim villages in the area were destroyed (Wang 1992:371). In April 1990, Chinese television reported that a separatist group in Xinjiang province declared a jihad against the government and hoped to establish an independent “Islamic Republic of East Turkestan.” The government purged the fourteen rebel villages and issued a new set of regulations that required imams, along with other religious leaders, to support socialism and the People’s Republic before they could be examined on religious matters and licensed (Mirsky 1990). In June 1993, a group demanding an independent East Turkestan claimed responsibility for exploding two bombs in Kashgar, southern Xinjiang (Gladney 1994c:183).

The process of constructing ethnicities suggests that they are formed by the wider political processes and are inseparable from them; ethnic identities are not simply the creators of the political process. The ethnicities so developed serve as agents of Muslim politics, however. Ethnicity can empower peoples, widening the horizons of individuals as participants in a larger enterprise and providing them with a sense of a distinct political boundary between themselves and others. These boundaries may overlap, but not necessarily, with those of "Islam." Ethnicity can also be used against peoples, setting them apart and disenfranchising them, and it can be used to support or delegitimize states. The reason why ethnicity can serve as an instrument of politics is that it may be seen as the "natural" source of political and social cohesion, thereby "deepening" the language and imagination of politics (Berman and Lonsdale 1992:317, 347).

** 5. Protest and Bargaining in Muslim Politics

| M | USLIM POLITICS has attracted immense, and largely unfavorable, attention. Interest—one might even say obsessive interest—has focused on such undeniably significant events as Shi‹i unrest in countries of the Arab/Persian Gulf in the early 1980s, the assassination of Egyptian state functionaries throughout the 1980s and early 1990s, Shi‹i suicide bombings in southern Lebanon since 1982, the bombing of the World Trade Center in New York in February 1993, and the murder of journalists, intellectuals, and foreign tourists in Egypt and Algeria in the early 1990s. These acts, carried out in the name of Islam, earned Muslims a reputation for violence and radicalism, but the relationships between Muslim groups and governments are more varied and less coordinated than such an unnuanced negative image implies. Because actors always have available the vision of alternate "imagined" communities, an important component of understanding politics consists of recognizing how these alternative, oppositional, and purportedly peripheral visions revise or replace currently dominant and authoritative ones.

If one were to look at the Muslim world in the 1950s, the politically active element of the population was more limited, despite the emergence in some countries such as Egypt and Iraq of student and trade union groups. One observer of Iran has commented that the 1953 coup d'état, facilitated by American and British intelligence, was only possible because no more than 10 percent of Iran's population was politically active. Most Iranians "entertained little thought of challenging the traditional elite structure" (Cottam 1993:21–22). Since then, major economic and social changes have widened the political base and provided new challenges to traditional elites.

Among those who are politically engaged today, a range of activities exists. Some Muslims may become protesters but only in the sense that they engage in the "politics of silence" or in everyday forms of resistance (Scott 1985). That is, their actions—such as resort to alternative banking associations (Singerman 1994) and reliance on Islamic private voluntary organizations (Sullivan 1994:57–98)—suggest dissatisfaction with state-defined policies and institutions, although they do not necessarily imply direct confrontation with the regime.

Accommodation and opposition are often juxtaposed, but these terms mask more finely calibrated positions. Since Sadat's coming to power in 1970, the Ikhwan al-Muslimun (Muslim Brotherhood) in Egypt—as opposed to "neo-Ikhwanist" groups—may have largely accommodated itself to the the political status quo. It has participated, for instance, in various elections, including parliamentary ones, under the banner of legally recognized political parties such as the Hizb alWafd al-Jadid (the New Wafd party) in 1984 and the Hizb al-‹Amal (the Labor party) in 1987. Yet it has also urged major changes in policies affecting social matters such as family legislation and in foreign policy concerns such as the peace treaty with Israel and Egyptian participation in the Gulf war of 1990–91. By the same token, opposition covers a range of activities—from working within the system to change it, as we have just mentioned, to rejection of the status quo as un-Islamic and violent confrontation with the existing political establishment. Therefore, the distinction between accommodation and opposition, as with other issues we have questioned in this book, cannot be sharply drawn and must be put into the perspective of local and shifting contexts.

Protest is a useful, if more general, term to refer to the spectrum of activities of Muslims, especially the politically active Muslims we refer to as Islamists. By definition, Islamist groups are involved in protest. They have resolved that the wrongs of society must be righted, but the corrective means are not restricted to one kind of activity. Protest may be "accommodative" (MacLeod 1991) in the sense of a desire to assert moral distance from and to criticize aspects of a political and social system whose foundations are basically accepted. This approach is not inconsistent with a process of bargaining between Islamist movements and the government or groups they criticize. Protest may also be "nonaccommodative" in the sense of either an unwillingness to abide by the rules of the game, or a desire to change the rules—although, as we shall see, even these approaches involve tacit bargaining.

*** Membership and Organization

All contemporary Muslim protest movements share certain elements. One is that they appeal to the same categories of persons who sense a gap between the status quo and their aspirations. They need not be materially deprived to feel discontent, but the perception of deprivation—relative to other groups in the society or to the globalized economy—is what matters. In fact, evidence suggests that those attracted to Islamist projects are often, but certainly not always, in what might be called the "lumpen middle classes"—the lower to mid–middle classes (Ibrahim 1980:438–39; see also, Goldberg 1992:211–13)—that include petit bourgeois traders and artisans (see Birtek and Toprak 1993:199) but also professionals who feel that their upward mobility has been thwarted by economic and political policies and conditions. In this broad socioeconomic grouping, many, if not most, see in their Islamist activity the chance for a better life. With specific reference to the Muslim Brotherhood, a "surprisingly consistent pattern that persists over almost a fifty year period is that radical groups appeal to, and recruit members from, the urban professional middle class, especially, in more recent times, engineers" (Davis 1984:141, also 142–43). A further indication of the attraction that Islamic ideologies exercise for professionals is the January-February 1990

elections in Gaza, in which Islamist candidates won five of the nine seats in the Engineers' Association; they likewise obtained 43 percent of the votes of the West Bank Engineers' Association in August 1992 (Jubran and Drake 1993:13; Milton-Edwards 1991a:260).

In the case of Shi‹i adepts of the Hizb al-Da‹wa al-Islamiyya (Islamic Call party) in Iraq, one study indicates that the majority have come from the urban lower middle classes, and include university students, soldiers, and small businessmen (Baram 1994:536). In Pakistan as well, members of the Jama‹at-i Tulaba (Students' Association), the student wing of the Jama‹at-i Islami (Islamic League), come from small towns and rural areas, but are primarily from the urban lower middle classes (Nasr 1992:72–73). Although the Jama‹at-i Islami itself has expanded its base, particularly since the 1970s, into rural areas, its core constituency is still from the lower middle classes in towns and cities (Nasr 1994:81–100). In Uzbekistan's Ferghana Valley, the growth in Islamic activism that has occurred since 1989 has been fueled by "social and economic problems, especially in the cities, where the lower and middle classes are concentrated" (Abduvakhitov 1993:89).

This is not to suggest that the poor, especially the urban poor, are entirely excluded from Islamist groups. Indeed, young people in the towns of the Ferghana Valley, fearful of the future and without certain job prospects, have been attracted to the idea of Islam as the solution to their problems. In northern Nigeria as well, the millenarian movements of the 1980s attracted marginalized "lumpen" laborers, such as seasonal workers and street peddlers, many of whom were impoverished migrants from other parts of the country and neighboring countries who had been attracted by Nigeria's oil economy (Lubeck 1987; Nigeria 1981:79).

Islamist groups may also appeal to the rural peasantry. One group in upper Egypt, broadly inspired by the teachings of Shaykh ‹Umar ‹Abd al-Rahman in the early 1990s, were led by individuals from wealthy families but attracted a large following of the poor—"a mix of peasants, seasonal workers, fishermen, drivers, and people in rural, petty service delivery" (Auda 1994a:402; see also Buccianti and Claude 1992:1, 3). Similarly, a revolt broke out in the Delta region of lower Egypt in August 1992 in which most participants appeared to be drawn from largely illiterate artisans, day laborers, sharecroppers, and the unemployed (Auda 1994b). In Turkey, the Refah Partisi (Welfare party, RP) drew particular, though not exclusive, support from a squatter-house district in Ankara, where it won the majority of seats in the munipical council elections of March 1994. In seven prior elections, the RP and its predecessor, Millî Salâmet Partisi (National Salvation party, received most of their support in the least developed provinces, particularly in eastern Turkey, of those in which they were successful (Akinci 1994). The discontents that followed economic restructuring and massive urbanization doubtless played a large part in their success.

One general explanantion for this socioeconomic and class diversity among activists is the process of objectification that we have discussed. Mass education opens the way to "democratized" access to sacred texts and overcomes restrictions as to who is "authorized"

to interpret them. As a consequence, the monopolistic control by elites—whether attained in fact or merely aspired to—is countered by the greater number of would-be interpreters from diverse backgrounds yet commonly possessing modern-style education.

To this class dimension, youth and education must be added. Muslim activists are overwhelmingly young, often, though not always, following leaders in their forties or younger. They are usually educated as well, often to tertiary level. In some parts of the Ferghana Valley, Islamist groups dominated by young people have taken over responsibility for public order from the central government. The leader of one Islamic militia told Abduvakhitov (1993:89) that he had “8,000 young believers organized into patrol groups.” In Pakistan, the Youth Force of one Wahhabi-style political organization, Jamiyat Ulama-i Ahl-i Hadith (Society of ‹Ulama of the People of the Hadith), was active in expressing opposition to Saddam Hussein during the Gulf crisis of 1990–91. Mobilizing Pakistani as well as Saudi and Kuwaiti students, the Youth Force declared its willingness to defend the Holy Places threatened by Saddam’s aggression (M. Ahmad 1991:164–65).

The youthfulness of participants in Islamist movements is not surprising when the demographic trends of Muslim nations—those forty states with a Muslim-majority population or with significant Muslim minorities (25 to 49 percent)—are considered.[34] Over 43 percent of the population of these countries was under fifteen years of age (Weeks 1988:13), with over 50 percent in Gaza and the West Bank, 44 percent in Algeria, 40 percent in Morocco, 39 percent in Egypt, and 37 percent in Indonesia (Omran and Roudi 1993:15; Population Reference Bureau 1993). In one town in India’s western Rajastan in 1991, 45.72 percent of the Muslim population was fifteen years old or less. If the population nineteen and below is considered, the figure rises to almost 56 percent. These figures are comparable to other parts of India (Ahmad 1994:121; see also Ahmad 1993:99–103). The youthful profile of many Muslim communities does not directly translate into support for Islamist movements, but can contribute to it when, for example, state policies or political rivalries eliminate a more experienced, older leadership through violence or exile. For example, some observers speculate that the December 1992 deportation of 418 Hamas and Islamic Jihad leaders from the West Bank and Gaza opened the way “for a younger, less experienced breed of leaders ... prone to internal divisions and splits” and more liable than older ones to be “trapped in an untimely showdown with the Israeli [and now Palestinian] authorities” (Abu-Amr 1994:129).

These young Islamists are often well-educated. In the case of the Da‹wa movement in Iraq, 61 percent of one list of martyrs (shuhada) to the cause in the early 1980s—victims of Saddam Hussein’s repression—were university educated (Baram 1994:536). Student elections, sometimes even at the secondary school level, are also a barometer of Islamist support, particularly in areas where other means of electoral expression are restricted or absent. In the West Bank, for example, Islamist groups won approximately 40 percent of the student vote between 1978 and 1987, and in the Gaza Strip, 65 to 75 percent (Legrain 1990; Abu-Amr 1994:19–21). Between 1992 and 1994, Hamas and Islamic Jihad participated in student elections at various universities throughout the West Bank and Gaza. Their success varied, depending in large part on community reactions to the stages of the

peace process and to electoral alliances that student activists forged on each campus. It is clear that Islamists have a distinct constituency on university campuses, but the size of the constituency and the strength of Islamist appeals vary.[35]

In Egypt, a 1988 survey of students at the Cairo University by Samia Mustafa al-Khashab demonstrates the disenchantment that university youth feel toward the official religious establishment and implies a substantial degree of attraction to Islamist groups. Seventy-five percent of the students surveyed regarded al-Azhar as “either partially or wholly ineffective” in responding to the needs of young people, while 70 percent wanted it to become more directly concerned with social problems. Nearly 75 percent of the students felt that Sufi orders made little contribution toward resolving social difficulties, and 68 percent believed that the orders were unnecessary. Concurrently, almost 75 percent of the students believed that the Islamist groups were responsive to the views and needs of Egyptian youth. Eighty-two percent believed that such groups should not be proscribed because they contributed to the improvement of social conditions and the “Islamic awakening” (cited in Starrett 1991:325–26). Such statistics, however, only partially capture the underlying tensions that accompany rising Islamic activism among the educated young. Patrick Gaffney’s narrative of mounting campus tensions at Egypt’s Minya University in 1978–79 suggests that Islamic activism in provincial universities possessed a more intense strength than was indicated in official and media reports. The role of Islamist sermons and religious “lessons” in spreading alternative and highly popular interpretations of current events was particularly underemphasized (Gaffney 1994:94–112).

Unsurprisingly, the Islamist movements that have become prominent in the 1970s and 1980s often have leaders who are relatively young, in their thirties and forties. The reason for this is not a supposed political tension between generations, and it is due to more than the changing demographic profile of the Muslim world. The reason lies in part in the higher educational level among the young, often enhanced by formative years overseas—stimulating negative as well as positive impressions—and in the fact that a good number of the older political activists already occupy important positions within existing parties or institutions. It is possible that individual members of this generation may break with the establishment for a number of reasons. Yet, younger people who have not been politically co-opted clearly do not need to be careerist in their politics, and can therefore afford to give voice to protest. Given demographic growth, it is this generation that is finding it hard to be assimilated into governmental and private sectors, and the grounds for their protest are considerable.

‹Abbasi Madani, one of the Western-educated leaders of FIS in Algeria, was a member of the revolutionary-era Front de Liberation Nationale (FLN, National Liberation Front) but came to believe that it needed to be reformed in Islamic directions. Until his arrest in mid1991, he showed a willingness to cooperate with the regime and to participate in multiparty elections as well as to endorse democratic ideas. Yet ‹Ali Belhadj (‹Ali bin al-Hajj) (b. 1956), another major FIS leader and imam of the al-Sunna mosque in the Bab al-Oued district of Algiers, articulates the disenchantment of his generation with the failures of the socialist and secular revolution. He has thus been harsher than Madani in criticizing the FLN and has

been more openly skeptical of the idea that the Islamic state must be democratic (Belhadj 1991:87–94).

The youthfulness of Islamist leadership has also been apparent in Central Asia. One of the first Islamist leaders in Uzbekistan, referred to in conventional Uzbek usage by his personal name only, Rakhmatullah (1950–81), came to prominence in his late twenties. In 1979, he publicly denounced his own religious teacher for having sold out to the Communist regime. Rakhmatullah, a mechanic by trade, and another young leader, Abduwali, argued that young Muslims should be thoroughly conversant in Marxist and Leninist doctrines in order to understand the politics of the state, but that students should also have direct access to printed literature on Islam. Muslim missionaries traveled to towns and villages throughout Central Asia and gradually won concessions from the Communist-era government. Although the movement slowed after Rakhmatullah's death in 1981, officially attributed to an automobile accident, what began as an apolitical Islamic "educational" movement in the late 1970s (see fig. 12) gradually became transformed into a political movement, known in Russian as the Islamskaia Partiia Vozrozhdeniia (Islamic Renaissance party), recognized by some but not all of the Central Asian republics.

We recognize, of course, that leadership, like the movements themselves, crosses generational lines. Rashid al-Ghannouchi, the leader of Tunisia's Renaissance party, became politically active in his thirties and continues to exercise influence in his fifties. Other leaders, however, acquired political prominence only later in life, as the obvious case of Ayatullah Khomeini indicates. Another example is Ahmad Yasin (b. 1937), a religious scholar and Islamic leader in Gaza who is associated with the Muslim Brotherhood and now Hamas. In the early 1980s, when Yasin was in his mid-forties, the al-Mujtama‹ al-Islami (Islamic Assembly) which he founded became a vehicle for Islamization, and in the mid-1980s he incurred the wrath of the Israelis (Yusif ca. 1989; Abu-Amr 1994:64–69). Shaykh Abubakar Gumi (1922–92), chief qadi of Kaduna in Nigeria, had long preached against the deviations of the Sufi brotherhoods, but he became politically prominent from the early 1970s, when he was in his early fifties. His political activity intensified from the late 1970s when the Izala reform movement (Jama‹at al-Izalat al-Bid‹a wa-Iqamat al-Sunna [Society for the Removal of Heresy and Reinstatement of Tradition]) was founded.

[[d-f-dale-f-eickelman-and-james-piscatori-muslim-po-14.png][Fig. 12. In Central Asia, the apolitical Islamic educational movements begun in the 1970s gradually acquired political overtones. Religious class at a new mosque, Karshinskaia oblast, Uzbekistan, 1992.]]

The rise of the Izala is explained in part by another feature of the modern Islamist experience—urbanization. The traditional Nigerian economy had been dominated by agriculture, contributing 65.9 percent to the gross national product in 1958–59, but by 1980 agriculture's share had dropped to 18 percent. Droughts in the 1970s took their toll, but the impact of oil was more pronounced. Particularly under the first military regime (1966–79), revenues were disproportionately applied to urban projects, resulting in a substantial exodus

from the countryside. The consequence of such rapid economic dislocation was discontent among the new urban residents whose aspirations for a more prosperous and secure life were largely disappointed (Kane 1994: 492–93).

Rapid urbanization also contributed to the rise of religious activism in Algeria. FIS appeals to the large number of individuals in the cities and their shantytown (bidonville) peripheries—which some observers call the non-villes (non-towns) (Labat 1994:55–56). Although the Algerian state and the FLN controlled the countryside, the shift in state investments away from agriculture toward heavy industry in the l960s and 1970s contributed to massive emigration from the countryside to the shantytowns that grew up around Algiers, Constantine, and major urban centers. By 1988, the result was that 44 percent of Algeria's population was living in cities, with most of the new immigrants living in inadequate housing. Many people were further impoverished as a result of the economic liberalization implemented beginning in 1988 by the regime of Chadli Benjedid (b. 1929; r. 1979–92). A 1991 survey of Algiers indicates the extent of the economic and social crisis. Threefourths of the youth aged sixteen to twenty-nine were seeking work, and each year the educational system produced 270,000 additional unemployed diploma holders. Some 80 percent of the youth of this age group continued to live with their families, often eight persons to a room (Daoud 1991).

Islamists in Algeria have found sympathetic audiences in these bleak milieus. In the early 1970s, the state liberalized the laws that regulated voluntary associations and authorized the construction of mosques. In other cases, authorities turned a blind eye to converted garages and other buildings serving as mosques. In the shantytowns, poorly supplied with any form of government services, most of these activities were carried out by Islamists, and thus their activities were not limited to mosques (fig. 13). As the quality of government schools deteriorated, Islamists provided schooling through mosques, sports facilities, and health services. In the earthquake that struck the Algiers area on October 29, 1989, FIS gained wide attention for the effective relief operation that it mounted. The net result was that Islamic groups took over many local functions the state was unable or unwilling to provide (Rouadjia 1990:34, 59, 77, 111). Between unemployed educated youth and members of an older generation who saw their agricultural lands confiscated under a 1971 agrarian reform law, there was no dearth of candidates for leadership.

The overall profile of other countries in which Islamist movements have taken hold since the 1970s is remarkably similar to those of Nigeria and Algeria. In Egypt, there has been a rapid urban growth in Cairo

[[d-f-dale-f-eickelman-and-james-piscatori-muslim-po-15.png][Fig. 13. Prior to 1992, the offices of the religious parties in Algeria, which were accessible to citizens and followers, had already begun to offer services that the government was unable to provide. Storefront headquarters of the Islamic Society Movement (Hamas), Oran.]]

and in provincial centers such as Assiut that has not been matched by the economic opportunities or hope for advancement available to earlier generations. Large areas of greater Cairo are deprived of effective governmental services, and in many poor areas Islamist groups offer basic medical and social services the government cannot provide. As in Algiers, these groups provided important, and publicly recognized, emergency assistance after the October 1992 earthquake in Cairo. Although education was once seen as a means of personal and social advancement and educational opportunities grew significantly in Egypt from midcentury onward, educational quality has declined and diplomas are no longer a guarantee of employment. In the decade of the 1970s alone, the number of students in Egypt doubled (Sivan 1985:51).

These “declassed, proletarianized students” form what Roy (1992:70, 73) has called a “lumpen-intelligentsia” for whom Islamist organizations and doctrines have much the same appeal as did Communism to western Europeans in the 1930s.

The situation is much the same in large cities elsewhere. Between 1976 and 1986 alone, Tehran’s population doubled from four to eight million inhabitants. The greatest rate of increase was from refugees and poor rural immigrants flowing into the slums of south Tehran

[[d-f-dale-f-eickelman-and-james-piscatori-muslim-po-16.png][Fig. 14. Women in Istanbul campaigning for the Welfare party, which was victorious in the 1994 municipal elections in Istanbul and elsewhere.]]

(Hourcade 1987:68). As bleak as the living quarters of recent immigrants may appear, cities and towns offer considerable material and educational advantages over their villages of origin as well as the promise of a better future. In Turkey, Pakistan, Tunisia, and elsewhere, Islamist strength is centered in the larger cities and towns (fig. 14). Islamic activism knows no geographical limits, but it often finds considerable support among recent urban immigrants and the lower middle classes who find their economic and social status increasingly threatened. Islamism offers an educated, unemployed younger population the hope of a way out of their difficulties and a reassuring sense of their own place in society.

Although the urban dimension is clearly important, the significance of rural areas should not be overlooked. Recent urban immigrants remain deeply influenced by their rural origins and maintain their links with the countryside through family and economic connections (Nasr 1992:73; Early 1992:49; Khuri 1975:184–86). In the specific case of secondary schoolteachers who join Islamist groups, a large number move from rural areas to provincial towns (see Mardin 1983:154) or the metropole—or indeed both, in a two-step process of internal migration. Although they may change jobs once in the urban environment, the traditional religious education to which schoolteachers are exposed in the rural areas continues largely to shape their worldview (Davis 1984:141).

Protest groups organized in the name of Islam possess broad appeal and attract large numbers of followers and sympathizers. It is impossible to specify membership figures with any precision, however, and many claims, either of the government or the groups themselves, must be treated cautiously. The Muslim Brotherhood in Egypt, founded in 1928, appears to have been a broad-based movement, expanding from four branches in 1929 to around 2,000 branches and between 300,000 and 600,000 “active members,” with possibly another half million sympathizers in the movement’s peak years between 1946 and 1948 (Mitchell 1969:328). Whether this figure is accurate or not, the Free Officers who planned the 1952 Egytpian revolution were acutely aware of the Brotherhood’s strength and made a tactical alliance with it (elSadat 1957:79–81).

Although Islamist movements pursue a power-seeking strategy that includes building a popular base in society, their membership is usually not mass-based, thereby providing another reason why it is difficult to do more than estimate their strength. Although they claim to speak for the Muslim community (umma) as whole, they depend on a cadre of committed activists supported by outer circles of supporters and sympathizers. Groups may distinguish between grades of membership, generally differentiating between the core of activists and others supportive of the goals of the movement. For instance, the Egyptian Muslim Brotherhood in the period of its founder, Hasan alBanna (1906–49) distinguished among active, assistant, affiliated, and combatant Brothers. In the Da‹wa party of Iraq, social and professional associations of Shi‹i sympathizers are called “the companions” (alansar)—the term used to refer to the Prophet’s first supporters in Mecca; they act “as a protective shield around the hard-core cadre” (Baram 1991:32).

Lebanon’s Shaykh Fadlallah and other religious leaders are disingenuous when they speak of Hizbullah “in the broad Qur›anic sense” of the totality of Muslims and deny that it is “an organized party” (hizb tanzimi), for it is clear that an institutional structure exists with gradations of membership (Fadlallah 1985; al-Shira‹ [1984] n.d.:147). Regular membership (al-intizam) is not open to large numbers of individuals—it involves special training and socialization, particularly for militiamen—but there are constellations of adherents or fellow travelers around this core (“Hizbullah” 1986). In essence, while the movement may attract popular support, depending on circumstances and issues, its membership may be seen to constitute concentric circles of sympathizers around a relatively small, though effective, group of committed adherents.

The Bangladesh Islami Chatri Sangshtha (Bangladesh Islamic Organization of Female Students), a women’s Islamic movement, parallels the male-only Muslim student movement, the Islami Chatra Shibir, and is active on university campuses and among the educated. Islami Chatri Sangshtha has six levels of membership, and progress through these is determined by a combination of mastery of a “syllabus” (consisting of reading, memorizing, and explaining the Qur›an; learning hadith; reading a specified set of Islamic books; and inviting others to join the movement), advancement of the movement’s goals, and obedience to the organization. Teaching sessions stress that “obedience to the Amir or head of the organization ... implies obedience to the Prophet Muhammad which in turn indicates obedience to God himself.” Discussion of politics is

introduced in the upper levels of the movement, and advanced members recognize that the movement raises women's political and religious consciousness and prepares them to take active political and social roles (Huq 1994).

In seeking a direct political role in society, some groups follow the model of organized political parties that seek to attract formally enrolled members and present a public platform of goals and policies. Such is the case with the Jama‹at-i Islami parties in Pakistan, Bangladesh, and India, which have fielded candidates in elections and participated in government. In Lebanon as well, AMAL has organized along political party lines that are familiar to Lebanon where multiparty elections have occurred since the founding of the republic. AMAL's charter (mithaq) identifies itself with the Harakat al-Mahrumin (Movement of the Dispossessed)—begun in 1974 by the Shi‹i religious leader Musa al-Sadr—and maintains that it is "a movement of all the people" and, as such, a national, Lebanese, organization (cited in Norton 1987:166). Yet AMAL simultaneously sees itself as a movement committed to improving the particular circumstances of the Shi‹a. To this end, it holds regular party conferences, produces policy statements, and issues membership cards. In Turkey, the Rafah Partisi evolved, according to Soncer Ayata, from a loosely-knit "confederation of Sufi groups" into an organized, professional party apparatus with a strong leadership and committed grass-roots support. This structure has helped them to get out the vote as, for example, in the March and July 1994 municipal elections, when they secured notable victories in Ankara, Istanbul, and elsewhere (cited in Akinci 1994).

Because of their claims to broad representation, however, Islamist groups such as Hizbullah assert that they are not like parties and do not depend on formal organization (tanzim). Yet, in practice, the movements are divided into public and secret organizations and are hierarchical and cellular, with rank determined by level of commitment. In some cases, as in the Iraqi Da‹wa and in Afghanistan's Jama‹at-i Islami, led by Gulbeddin Hikmatiyar (b. 1947?), the cell (khalwa) organization is inspired by the secular Ba‹thist or Marxist-Leninist structures in which some Islamists formerly participated. The Da‹wa is divided into two "wings" (janahs), one military, the other, political. The military wing has supervised the training of members in Iran, Lebanon, and Syria. Among other activities, the political wing has engaged in a vigorous publication program (‹Abd al-Hadi 1983:19).

In other cases, the model for inspiration and legitimation is the celllike structure of Sufi orders, which have layers of initiation and commitment, some of which are concealed from external view. The Muslim Brotherhood, for example, was based on cell-like organization, and its leader was referred to as murshid (guide), a term used of Sufi shaykhs. As with the Iraqi Da‹wa organization, the secret wing of these Islamist groups is sometimes called the combatant (jihadi) wing, which may employ violence that would be deniable by the group's public, or "civilian" (madani) wing (Drayf 1992:237–41). The Muslim Brotherhood developed a "special organization" (al-tanzim alkhass), which was responsible for such acts as the assassination of Prime Minister Nuqrashi Pasha in December 1948 and other similar acts of violence.

*** The Technologies and Culture of Protest

In 1994, the film al-Irhabi (The Terrorist) created fierce controversy in Egypt and elsewhere in the Arab world. Starring ‹Adil Imam, one of Egypt’s most popular actors, it cast Muslim activists in a violent light and portrayed them as simpleminded and boorish, with their leaders manipulative and authoritarian. Bourgeois life, by way of contrast, was depicted as cosmopolitan and tolerant. Liberal media professionals, unhappy with the Islamist project in Egypt, did not require instruction in the socializing or propaganda potential of mass communications—particularly in the video version of the film which could be viewed in the privacy of the home. Moreover, while the Mubarak government may not have produced the film, it could not have been unhappy with its message.

Muslim critics of the status quo also make use of the technological instruments of the modern mass culture. Television, radios, cassettes, videos, personal computers, photocopiers, facsimile machines, and electronic mail are frequently, if not routinely, found in the homes and offices of Muslim activists, ‹ulama, and Sufi shaykhs as well as those of government officials. The use that Ayatullah Khomeini and his supporters made of the direct-dial telephone and cassettes to incite revolutionary sentiment in Iran is well known, and was prefigured in the utility that Jamal al-Din al-Afghani (1838/39–1897) saw in secretly printing and distributing leaflets to agitate against the Qajar ruler, Nasir al-Din Shah (r. 1848–96). Moreover, opposition to the tobacco concession, which al-Afghani and others among the ‹ulama, merchants, and townspeople expressed in 1890–91, was encouraged by resort to the telegraph. This new device allowed opponents to maintain contact with each other and Shi‹i religious figures in Iraq, and to coordinate their activities (Keddie 1981:65–67).

Such ready usage of available technologies is not, however, unique to Iran. Indeed, Islamic groups from Southeast Asia to Europe publicize and propagate their message in sophisticated ways that seem unremarkable. Groups responsible for the kidnapping of Western hostages in Lebanon were referred to as “telephone” organizations, and the Egyptian magazine al-Musawwar reported that a raid on a software import firm disclosed the structure of the clandestine wing of the Muslim Brotherhood (“Structure, Aims of Muslim Brotherhood Detailed” 1992:5). The organization used sophisticated coded computer records to track members who had infiltrated the police, judiciary, press, medical, and other professions.

Dar al-Arqam (House of Arqam), a Malaysian millenarian group that was outlawed and its leader arrested in October 1994, was adept at creating a financial empire in several countries. It ran bakeries and bookshops among its diversified activities in Malaysia and elsewhere in Southeast Asia, but it also operated technology service and desktoppublishing businesses. It paid for its members to acquire technical as well as other training overseas,

and one of its posters proclaimed: “With advanced technologies, Muslims can manage the world according to Allah’s law” (Karp 1994).

Technology is of course neutral, but its use subtly alters the disseminated message. Print and other technologies create new forms of community and have transformed authority and social boundaries, defeating conventional assumptions of a “great divide” separating “tribal” and urban, nonliterate and literate. The collected essays in Literacy in Traditional Societies, edited by Jack Goody (1968; see also, Goody 1977, 1986) made a significant step toward recognizing the religious and political implications of the written and printed word, and Benedict Anderson’s Imagined Communities (1983) subsequently noted the transformative value of writing and printing and demonstrated their contribution to the formation of national and religious identities.

A succession of new media technologies has profoundly contributed to Islamic political movements in Afghanistan, beginning with “print Islam” (Eickelman 1989b:17) in the course of this century. As David Edwards explains, the development of print communication in Europe over five hundred years appears leisurely in contrast to Afghanistan, where its development is compressed into little more than a century. Print and telegraph communications transformed the ways in which people were governed, thought about one another, and conceived of their religious identity (Edwards 1995; also see Edwards 1993).

The first Afghan newspapers of the late nineteenth century had a limited circulation, although, as in Central Asia at about the same time (Khalid 1992:116), they reached a small literate elite that had an influence far beyond its numbers. Newspapers provided a focus for the development of political ideas that were at least partially independent of the previously influential circles of court, tribe, and mosque (Edwards 1995:171–73). Indeed, by the late 1920s and 1930s, newspapers had become a major vehicle for advancing political causes. For example, a weekly four-page newsletter, Irshad-unNiswan (Guidance for Women), appeared in 1921 (Majrooh 1989:94). Such publications gave prestige to the government internationally and offered employment to graduates of Afghanistan’s secondary schools and madrasas (religious schools). Through the judicious use of subsidies, newspapers restrained potential dissidents by keeping them on the government payroll.

By the late 1940s, secular modernists had begun to speak out against the traditional religious establishment. Religious leaders were initially on the defensive, as they were unskilled in dealing with the ways in which secularists disseminated their ideas. Although by the 1960s leftist newspapers flourished, only one major independent religious newspaper, Gahiz, had emerged by 1968. Leftist newspapers and pamphlets, supplemented by Soviet radio propaganda in Afghan languages, provided arguments for secularists to use against Islam. In turn, Gahiz and religious tracts in Afghanistan, as with publications elsewhere in the Muslim world in the 1960s and 1970s, provided crucial texts and arguments for Muslim intellectuals to use against those whom

they regarded as antagonistic or less committed. In Kabul University and elsewhere, religiously minded students formed study groups in which many of these publications were discussed, their goal being educational rather than explicitly political.

Whatever the major differences between secular leftists and religious modernists in the 1960s, both had parallel experiences. They had both been educated in government schools and constituted the first generation to acquire literacy. Political radicals encouraged confrontation and polarization in Afghanistan through both their organizations and their newspapers and pamphlets. These publications emphasized loyalty to the authority of the organization, not to the authority of the state or traditional elites. Muslim groups, notably the Muslim Youth Organization at Kabul University, followed the lead of the leftist groups and the Muslim Brotherhood, which Afghan students in Cairo had observed firsthand in the 1950s. These Muslim groups thus used their publications to affirm not only the validity of Islamic solutions but also the necessity of allegiance to the Islamic organizations themselves. The larger Islamic mission became dependent on prior obedience to the movement, and the routinized expression and promotion of this linkage became essential for success. This process helps to explain how Muslim groups, initially organized for the purpose of education or spiritual improvement, became transformed into more formal political organizations such as the Hizb-i Islami Afghanistan (the Afghanistan Islamic party), dedicated to overthrowing the post-1978 Marxist government.

Although the various resistance groups, including Jama‹at-i Islami, two rival Hizb-i Islami groups, and Shi‹i organizations, all opposed the Soviet invasion and the Marxist government, and notwithstanding appeals to Muslim solidarity, their common goal did not lead to close integration. Most Afghans saw the Marxist takeover in April 1978 as having little to do with ideology, but as a triumph of the Ghilzai Pashtu, to whom many of the coup leaders belonged, over the Durrani Pashtu. In simple terms, it was read as the victory of one traditional qawm, or ethnic group, over another. By 1980, the Marxists had dropped most of their ideological propaganda, sought to persuade Afghans that they were not against Islam, and tried to play on traditional tribal rivalries. This was in contrast to earlier efforts at land reform and other initiatives that ignored traditional tribal and religious structures (Korgun 1993:106). The Islamic resistance groups failed to unite, even when urged to do so by their foreign supporters—including Saudi Arabia, other Gulf states, Pakistan, and the United States; rather, each group relied on a particular set of tribal and ethnic ties. These divisions became more pronounced after the Soviet withdrawal in 1989 as each group now saw the opportunity to seize power at the expense of its traditional rivals (Roy [1985] 1990:215–21; Canfield 1989).

As we described in Chapter 4, tribal, ethnic, linguistic, and kin divisions persist, despite Islamist aspirations. In some respects, resistance to Marxist rule and the Soviet invasion of Afghanistan provided one of the most clear-cut opportunities for jihad against a clearly defined “infidel,” yet this did not result in higher unity in the name of Islam. The “routinization” of Islamic ideas through print and pamphlets and through higher educational levels helped institutionalize ideas of shared Islamic identity, but it did not in itself suffice to transform an oppositional movement into one capable of exercising state authority.

In Afghanistan and elsewhere, audiocassettes, easy to smuggle and readily duplicated, have begun to replace, or at least supplement, pamphlets as a form of religious debate. The pamphlet has the advantage of greater anonymity for the author, but the cassette has other advantages. Cassettes are inexpensively and easily reproduced, and they may be played virtually anywhere—in the home, automobile, mosque, or other meeting places. Perhaps the greatest advantage of cassettes is that they provide access to currents of Islamist protest outside of one's own society. The sermons of Lebanon's Shaykh Fadlallah, Egypt's Shaykh ‹Abd al-Hamid Kishk, and Malaysia's Haj Hadi Awang are widely available beyond their country of origin and are often found in Europe and America where Muslim students are located. "Voiced Islam" (al-Islam al-sawti) has thus become a formidable force rivaling "print Islam."

In earlier generations, the exposure of students to Islamic ideas would have been through the Qur›an and religious treatises. Increasingly, however, it is the pamphlet, the popular sermon (khutba), the cassette, the telephone, and the electronic mail news service (J. Anderson 1994) that distribute information and ideas to all parts of the Muslim world. The National Research and Fatwa Center in Ann Arbor, Michigan, has set up a toll-free telephone line so that individuals may seek direct advice and fatawa on issues of concern from "knowledgeable Sheikhs and Students of knowledge." One can telephone, fax, post, or electronically mail questions, and answers are given in English or Arabic (IANA 1995). One result of such use of modern technologies is a new awareness of larger trends in the Islamic world, which, as we will discuss in the following chapter, involves the creation of a Muslim transnationalism. Another consequence of the use of modern technology is a kind of empowerment of protest groups within each society. Conscious now that Islamic groups elsewhere bear similarities to their own situations, and influenced by transformations in the Islamic political vocabulary that others may have crystallized, protest movements may find a bolder voice and be encouraged to more decisive activity in pursuit of their goals.

In the cassettes that record the sermons of Shaykh ‹Umar ‹Abd alRahman, who has been influential in the Islamic Associations (alJama‹at al-Islamiyya) in Egypt and who was charged with complicity in the bombing of the World Trade Center in New York, one hears that sovereignty belongs to God alone (al-hakimiyya li-llah). In a commentary on Surat al-Kahf (18: "The Cave") of the Qur›an, for instance, he does not directly name his target, the Egyptian government. Yet, he makes an unambiguous political point when he argues that no congress or party has the right to make laws. The audience hears, "Anyone who makes such laws are not believers" (‹Isa 1992), and would understand that governments that infringe on God's sovereignty are illegitimate and undeserving of allegiance.

Cassettes that transmit sermons vary considerably in content, but most are similar in form and often echo the authority of the mosque.[36] The preacher (khatib)—and mosque preachers are exclusively male— chooses as his text Qur›anic verses that are to be explicated. Moral instruction is the primary purpose, and often most of the sermon deals

with standards of ethical conduct or matters of ritual practice and dress. Yet, as the above example illustrates, political matters are not absent, although the preacher rarely deals directly with such questions. Rather, the argument proceeds by indirection. For example, an approving reference to the probity of the “rightly guided” caliphs of early Islamic history would not be lost on the audience as a veiled attack on the injustice and immorality of present-day leaders.

Sermons also invoke a range of authorities that may be surprising. Invocations of the Qur›an and hadith are unexceptional, and references to classical Muslim thinkers such as Ibn Taymiyya (d. 1328) and alGhazali would be common as well. Yet preachers frequently resort to citations of both contemporary Muslim intellectuals such as Sayyid Qutb, al-Mawdudi, Kishk, and Shaykh ‹Abd al-‹Aziz ibn Baz of Saudi Arabia, but also Western writers and publications.[37] For example, in Saudi sermons distributed via cassettes during the 1990–91 Gulf crisis, preachers explicitly invoked such sources as the memoirs of Richard Nixon, the Voice of America, the Financial Times, the Cable News Network (CNN), and the writings of George Bush, in addition to such contemporary Arab periodicals as al-Hayat and al-Watan al--Arabi. These references were invoked to support the case that the United States harbored nefarious intentions in the region. This has notably been true of Shaykh Safar al-Hawali, whose pronouncements during the crisis have been compiled as Kashf al-ghumma ‹an ‹ulama al-umma (The unveiling of distress about the ‹ulama) (al-Hawali 1991: for example, 16, 69, 71, 75–79, 83, 101, 131).

The consequence of this rhetorical style is the emergence—objectification, in our terminology—of an Islam that is manifestly political and ostensibly modern at the same time. Without directly advocating sedition, therefore, the preacher is able to deliver a political lesson that appears at once traditional and, because of the reference to both modern Muslim and Western intellectual trends and writings, “rational.” Although denouncing the West and Western values, many preachers thus implicitly employ Western arguments to convince their audiences of their own modern and contemporary focus.

The security implications of the dissemination of religious cassettes—and videos—are obvious, and government efforts to staunch their flow across borders are ineffective. Up to 1992, the Arab Postal Union banned the sending and receiving of audio- and videocassettes. Although by 1993 this formal restriction had been lifted (for example, Royal Mail International 1993:236, 390, 480), cassettes sent through the post are still subject to inspection and delay and often fail to reach their destination, and customs inspectors routinely seize such materials until they can be reviewed by censors. In one Gulf country in 1988, the head censor himself was implicated in smuggling radical Shi‹i videocassettes. In Egypt, proscribed material has not necessarily been smuggled from outside sources. Sections of larger towns and cities have become difficult to control, to the degree that the Egyptian press reports a clandestine arms industry, which, although it has crossborder links with Libya and the Sudan, appears mainly home-grown (Subhi 1993). If arms can be clandestinely produced and distributed, how much easier it is to circulate cassettes and

pamphlets. The effect may be significant: If cassettes are passed hand to hand, this may increase the solidarity of oppositional groups.

Although some of the videos and cassettes explicity advocate violence against the state, the vast majority, as we have said, stop short of this. Cassettes are used, for example, to transmit nashids (anthems), which are widely circulated and often reflect national or regional styles. Nashids build on such musical traditions as the quwwali from South Asia and rhythmic chanting from the Middle East, especially as practiced in Sufi traditions (see Waugh 1989). They typically have a martial air and involve male choruses that repeat, often to drum beats, variations on standard Islamic phrases such as Ya Allah Allah, Allahu akhbar (O God, God, God is most great) (“Nasyid Iran” n.d.) or the shahada, the profession of faith in the one God and His Prophet. Lyrics attesting to the greatness of Islam and the special mission to purify it are added (as in the nashids of the Muslim Brothers, for example, “Nasyid Ikhwanul Muslimin” n.d.), but at times explicitly political themes also emerge. Yusuf Islam, a British Muslim convert and a former popular singer, recorded a nashid in support of the jihad in Afghanistan:

O victory is coming and history will tell ’cause the disbelieving army is heading for hell.

And paradise belongs to the pious and firm, to God we belong and to Him we return.
Afghanistan and Islam,

Afghanistan and Islam,

Ya Muslimun, ya Muslimun

<right>

(Islam n.d.)

</right>

In the United States and western Europe, rap music has become tantamount to the nashid. Rap and hip-hop groups in Europe articulate a sense of disquiet with their societies and use their songs to highlight and implicitly protest against the racial and social discrmination that Muslims often feel. In the process, they attract audiences among

both Muslims and non-Muslim youth, the latter primarily from racial or ethnic minorities. The group Cash Crew projects a particularly resonant message of protest in “Thatcherite,” Conservative-led Britain:

I ask you a question Who is your master?

Islam says it’s time to wake up

In this place called England ...

The sun will rise in the West

And will bring them to one God,

Allah the Magnificent

Who has no partners

The truly Beneficent...

Englishman is funny ...

Worshipping the money ...

In this system you can’t be happy,

But this is all you know

Since you come out of your nappy

<right>

(Cash Crew 1994)

</right>

In the United States, Public Enemy is more outspoken in its denunciation of white-dominated society and has allied itself with the Nation of Islam faction led by Louis Farrakhan, who has often been accused of intolerance toward whites and Jews. The acknowledgments on its recordings contain the invocation, “All praise is due to Allah,” and the shahada, the profession of faith, is evoked in the following lines:

Listen Christian, Muslim, Jew

Here’s a little something that I thought you knew

There’s only one God and God is one

<right>

(cited in Wells 1990:43)

</right>

In its song, “Don’t Believe the Hype,” Public Enemy equates the initially skeptical reaction to Elijah Muhammad (1897–1975), the founder of the Nation of Islam, and Malcolm X (1925–65) to the hostility that greets Farrakhan in both the African-American community and the wider American society. In performance, the group appears with a bodyguard reminiscent of the Fruit of Islam, the security force of the early Nation of Islam and of Farrakhan’s faction today. Members of Public Enemy at times also display the star and the crescent. They urge followers to listen to their message directly:

The follower of Farrakhan

Don’t tell me that you understand

Until you hear the man

<right>

(Public Enemy 1988)

</right>

As the former “Minister of Information” of the group, Professor Griff, said: “If you say that black people have been robbed of their name, their language, God, culture and religion and stripped of their very being—can you say that we are ourselves?” Farrakhan’s Nation of Islam is attempting to rectify the situation in part through its “Do for Self” program: “We don’t steal, We don’t step on the poor. Black Americans have got to stop begging white Americans” (Wells 1990:43).

The importance of the nashids and rap music is that they represent the ways in which popular cultural forms can be mobilized to foster claims and counterclaims in Muslim politics. The insistent rhythms, assertive refrains, and often mocking tones are especially effective in articulating protest. Hannah Arendt reminds us: “To remain in authority requires respect for the person or the office. The greatest enemy of authority, therefore, is contempt” ([1969] 1986:65). Like humor, music can be subversive. It is a popular representation of Muslim symbolic politics, but, as we would expect, it may also be ambiguous in its political message. Even the intemperate language of Public Enemy leaves one uncertain as to whether the group possesses an exact political program. The ambiguity of these recorded messages makes it all the more difficult for governments to prohibit them.

Governments also worry about the use of such technologies as the fax and electronic mail. One group in Algeria, the “Fax Group,” has been charged with antistate activity (for example, BBC SWB, ME/1688, A/10, May 14, 1993). Often using the United States as a base, electronic mail networks also disseminate information and points of view across the world and are particularly used by university students at both the undergraduate and the postgraduate level. They relay news stories collected from various media—for example, on the status of Muslims in Bosnia, FIS in Algeria, and Kurds in Turkey—and comments on these stories. Many of these networks are specific to countries, including Israel, Palestine, Turkey, Egypt, Saudi Arabia, and Algeria. In some cases, officially disseminated news bulletins, such as those offered by the Algerian embassy in Washington, are immediately countered by

opposition groups. In other cases, electronic networks aim for a broader audience by referring to themselves as “Islamic.” One example is the Islamic Information and News Network, a subsidiary of the Pakistan News Service, which has regularly reproduced sermons and speeches of Hamas leaders, among others.

The self-representation of these networks expressly devoted to Islamic issues is unambiguous. Islamic World Journal, produced by the International Muslim Students Union (based in Seattle, Washington), says that it is “committed to raise awareness and enhance the unity of Muslim communities while providing an inside view of the Global Islamic Movement.” To this end, it provides extended commentary on such contemporary issues of Muslim concern as the Kashmir conflict (“Censoring the History” 1994). These networks also often call for action in support of “moral,” though not necessarily Islamic, causes. For instance, one electronic news service reported that Williamson County commissioners in Texas refused to give Apple Computer a tax abatement because Apple had granted health benefits to the partners of homosexual employees. The service called upon Muslims to write to the county commissioners to support them in their stand against “shrinking morality and [the] rampant indecency of sexual promiscuity” (“Williamson County” 1993).

The globalization of information is an inescapable part of the modern world, and, as elsewhere, in the Muslim world it may enhance the abilities of protest groups while increasing the vulnerability of governments (Sreberny-Mohammadi and Mohammadi 1994:28–31; Scholte 1993:47–49). In Saudi Arabia, for example, the government has recognized the potentially negative effects of satellite communications systems. Pressured by the ‹ulama, it has banned the use of satellite dishes, which had become popular during the Gulf war in order to receive CNN broadcasts. The dishes continued to grow in popularity, and the regime feared that Saudis would be able to obtain morally and politically harmful material that avoided state censorship (“Saudi Arabia Bans All Satellite Dishes” 1994; “Antennes paraboliques” 1994). Although the Ministry of Interior, responding to opposition from the middle classes, has quietly let the ban go unenforced, the Saudis are spending a substantial amount of money to develop a cable system which would compete with other cable systems—Arab and Western— and which would be easier to censor (Khalaf 1994). The Iranian Majlis also ratified a ban on satellite dishes in December 1994. In another indication of the importance of symbolic politics, some Iranians, angry about the domination of American cultural programming, compared satellite dishes to the American flag (“Iran Prohibits Satellite Dishes” 1994). Although the Constitutional Council soon declared the Majlis bill impermissible on narrow constitutional grounds (“L’Interdiction des antennes paraboliques” 1995), the fear that outside transmissions may undermine the cultural and political order remains apparent.

*** The Fragmentation of Authority

As we argued in Chapter 3, common to contemporary Muslim politics is a marked fragmentation of authority. The ‹ulama no longer have, if they ever did, a monopoly on sacred authority. Rather, Sufi shaykhs, engineers, professors of education, medical doctors, army and militia leaders, and others compete to speak for Islam. In the process, the playing field has become more level, but also more dangerous.

Two conceivable outcomes of this fragmentation are possible. One is the intensification of dispute and contest; in the metaphor of the market, the “price” of Islamism may be pushed upward by a number of keen, and uncooperative, bidders. This is the scenario that many, if not most, Western observers—and a good number of Muslim commentators—believe is likely. The political forecast for Egypt, Algeria, Saudi Arabia, the Sudan, and sometimes Indonesia, among other countries, is often unfavorable because it is assumed that they will succumb to the centripetal tendencies of conflict within Muslim societies.

Evidence can certainly be marshalled to support this line of argument. Takfir, the proclaiming of a fellow believer as an infidel, and the transformations in the concept of jihad so as to accord primacy to the enemy within the Islamic state or umma are ideological currents of marked potency in the current age. Moreover, the use of violence to support these currents is an undeniable fact of life. Ministers of Awqaf, presidents, amirs, and ‹ulama have all been targeted for attack, but so, too, have Muslim “liberal” critics such as Faraj Fuda, the Egyptian writer who was murdered in June 1992 for his supposedly antiIslamic views, and Taslima Nasreen, the Bangladeshi woman writer who is accused of suggesting in print that parts of the Qur›an need to be revised (Philip 1993; Brown 1994). In Algeria and elsewhere, Islamists have targeted intellectuals, journalists, novelists, teachers, and others identified with the propagation of values contrary to their own. In Egypt, a parliamentary deputy attacked the government for promoting anti-Islamic values and “immorality,” citing as evidence the publication six months earlier of a photograph of a nude by the Austrian painter, Gustav Klimt (1826–1918), in a cultural monthly. Following this attack, several Egyptian intellectuals, including the Nobel Laureate Naguib Mahfuz, spoke out against “intellectual terrorism in the name of Islam” (“Le Terrorisme intellectuel au nom de l’Islam” 1994:1).

Such activities have polarized Muslim societies, with authoritarian governments ironically assuming the mantle of liberalism against Islamism. The ‹ulama may simply be instruments of the regime in this process, but very often they agonize over both the degree of what they regard as the radicalization of Islam and the extent of the government’s heavy-handed response. In Egypt, for example, Shaykh Muhammad al-Ghazali has spoken of his worry about Islamist groups at the same time as he has been anxious about the regime’s response. Curiously, for a member of the official religious establishment, he has also appealed for equal time in the media:

There are those who hate all Islamic trends, whether moderate or extremist. They are waging wars against Islam, both secretly and openly. They make derisory pronouncements

(al-ta‹alim bi-l-ghamaz) about it. All we want is that the callers to Islam (du-at al-Islam) be accorded the [same] opportunity [to air their views] that their rivals (khusum) have. (alGhazali 1989:1)

Such descriptions come close to suggesting that civil war looms on the Muslim horizon.

But this is only one way of looking at the situation. A second, alternative, view is that the multiple centers of power and contenders for authority come to various accommodations; in the market metaphor, the price is negotiated to the relative satisfaction of all. If we take just the Islamist groups as our example, it is apparent that they must interact with four sets of actors: the government, external patrons such as Saudi Arabia or Iran, other Islamist groups, and the masses or the target audiences from which they wish to attract sympathizers. The Muslim Brotherhood in Egypt, for example, has at times vigorously, even violently, opposed the government, but over time it has adjusted its strategy to the prevailing political winds. It has had to take into account both the suppression and the enticements of the government; the relatively conservative concerns of financial backers such as the Saudi monarchy; the pressure from other, more demanding Islamic groups that may regard it as having sold out to the establishment; and the amorphous, often illiterate masses whose religious and political formation they hope to control. An intricate politics of compromise and give-and-take may thus result and be as likely as civil war.

In several Muslim societies, Islamist groups—when indeed they are allowed to do so—have even routinely participated in electoral politics. In Egypt, the Muslim Brotherhood, not officially recognized as a political party, participated in electoral alliances in the parliamentary elections of 1984 and 1987, winning 12 and 32 seats respectively. Along with other groups, it refused to participate in the elections of December 1990. In Tunisia, Islamist candidates won 14.5 percent of the national vote in April 1989 and up to 30 percent in major cities. Partly as a result of this strong showing, the government has refused to legalize the main Islamist movement, Hizb al-Nahda. In Jordan, where King Hussein initiated a process of political reform in November 1989, Islamic candidates scored an unanticipated victory in the first parliamentary election in twenty-two years. Islamists took 34 out of the 80 seats, with the Muslim Brotherhood securing 22 of these seats and other Islamists winning 12 more. In the November 1993 parliamentary elections, following the adoption of a one-person, one-vote system, the number of Islamists elected declined to 16. Yemen’s first elections occurred in April 1993, and al-Tajammu‹ al-Yamani li-l-Islah (the Yemeni Gathering for Reform), while failing to win a single seat in the south (formerly the People’s Democratic Republic of Yemen), won 62 seats in the north. It came second to the 121 seats of the General Popular Congress, the president’s party that governed the north prior to Yemeni unification in 1990 (Dresch and Heikal 1994).

In the August-October 1992 parliamentary elections in Lebanon, Muslim groups such as Hizbullah and AMAL fared relatively well. Boycotted by a number of groups, especially Maronite ones, and tarnished by allegations of voting irregularities, the elections were

nonetheless an indicator of Islamist strength in the southern Jabal ‹Amil and eastern Biqa‹ Valley areas. Out of a total of 128 seats in the Majlis al-Nawab (Deputies' Assembly), Hizbullah took 8 seats out of the 27 Shi‹i deputies elected. Four other non-Shi‹i deputies—two Christian and two Sunni—appeared on Hizbullah's lists and vote with it in parliament. Hizbullah has specifically used its parliamentary platform to oppose any Lebanese-Israeli peace treaty. AMAL, which has been more willing to accommodate itself to the Lebanese state, took four seats in the elections. Its leader Nabih Birri became speaker of the assembly, after the long-serving Shi‹i speaker, Husayn al-Husayni, resigned his post in protest at what he saw as Hizbullah vote rigging in the Biqa‹. In addition to Hizbullah and AMAL members, three deputies were elected from two Sunni Islamist groups (el-Khazen and Salem 1993:48, 419–33, plates 12 and 13).

In Indonesia, the Partai Persatuan Pembangunan (PPP; United Development party), was founded in 1973 as a government-approved coalition of Muslim parties. In the 1977 elections to the House of Representatives, PPP won 99 out the 360 seats, and 94 in the 1982 elections. In 1984, however, Nahdatul Ulama, the most important component of the coalition, withrew from the coalition and PPP's share of the vote declined accordingly. In the 1987 elections, it took only 61 of the 400 parliamentary seats, and in 1992, 62. Malaysia has a well-established parliamentary tradition, and Parti Islam Se-Malaysia (PAS; PanMalaysian Islamic party) has participated in national and state elections, with mixed success. Although it had cooperated with the ruling party between 1973 and 1977, it became a sharp critic of official policies. On the national level, PAS won five parliamentary seats out of 154 in 1982; one out of 177 in 1986; and seven out of 180 in 1990 when several other smaller Islamically oriented parties participated. In the October 1990 elections, the ruling Barisan Nasional (National Front) coalition lost all 39 state assembly seats and 13 parliamentary seats in Kelantan to PAS and its ally, Semangat '46 ("Spirit of '46"). PAS has since cautiously promoted an Islamic social agenda there.

Rather than assuming that protest politics inevitably ends in confrontation, therefore, it is useful to recognize that the dynamics of interaction among the various political actors who are seeking power and influence generates de facto rules of the game. These rules need not overlap with constitutional, formalized precepts, but they suggest that competitors, including the government, engage in bargaining. Governments prefer to obscure the fact they are dealing with Islamist groups in this way, but there is no denying that they do so. It would be exceptional if they did not. The implication is that this tacit bargaining, the working out of implicit rules for a modus vivendi, creates a form of short-term stability—even though this may not be desirable ultimately. Indeed, each protagonist hopes that in the long run such de facto interaction will induce favorable changes in the conduct of competitors (Mitchell 1981:123–25, 197; also Auda 1994a:374–75).

Tacit bargaining is a more common occurrence than is normally acknowledged. The fact the British government and the Irish Republican Army are unalterably opposed and advocate very different resolutions of the Irish problem has not prevented their quietly talking to each other and devising procedures for limiting the effect of violence. Likewise, French authorities, who have steadfastly claimed in public that they would not meet with representatives of FIS,

labeling them as “terrorists”—and who tried to persuade the Americans to break off “dialogue” with FIS in mid-1994—were somewhat embarrassed by press revelations that Charles Pasqua, the Minister of the Interior, had met secretly in Germany with FIS leader Rabah Kébir and that the government maintained other contacts with FIS representatives (Cuau 1994; Lesieur 1994).

It would be foolhardy to predict the result of the protest politics of Muslims. Neither alternative that we have outlined is inevitable. Without question, politics is localized and subject to particular and changing circumstances. But, given the broadly held assumption that Muslim politics is inherently revolutionary, it is important to note that there is nothing preordained or permanent about its radicalization. Indeed, some observers believe that the radicals’ “moment” may have come and gone (Roy 1992). Whether that is the case or not, politics in the Islamic world belongs alongside other political orders: Protest and bargaining constitute its two, intimately interconnected, sides.

** 6. Muslim Politics: a Changing Political Geography

| A | S INDIVIDUALS AND SOCIETIES struggle to make sense of the global processes of rapid social, economic, political, and technological change, standard conceptual maps of the social and political world become obsolete and the necessity for new guideposts obvious. Geopolitics—the “art and science of understanding and predicting spatial aspects of the shifts in political power among groups, particularly states” (Demko and Wood 1994:3)—once primarily focused on physical frontiers and the control of territories. Now it increasingly involves a politicized geography of groups and movements with competing claims and counterclaims. For nearly three decades, geographers have used terms such as “spatial awareness” (Wheatley 1976) to invoke the multiple levels of perceptions involved in understanding loyalties, opportunities, and affinities among persons and groups. Yet in recent years, a Brooklyn rabbi, Menachem Mendel Schneerson (1902–94), who never set foot in Israel, became a major voice in Israeli politics (Friedman 1994:328–30, 351–53; compare Kepel 1994a:140–90). Likewise, Morocco is only one of many states to recognize the continuum with its emigrant community. State authorities seek to promote a sense of “home” by encouraging emigrants to vote in national elections and by showing solicitude for their interests while living abroad.

Location and space have undergone such transformations that it is possible to argue that “primordia ... have become globalized.” Where once territory was the root of one’s identity, ethnicity and religious activism have become “deterritorialized” (Appadurai 1990:11, 15) to the point where adherents, such as Sikh or Muslim activists, identify with each other as much as, if not more, than they do with the fellow citizens of their national homeland. Migration in search of work or political freedom, socialization through the defining literature and practices of a new movement, and immersion in the global culture contribute to this reorientation and reorganization of religious identifications—and, by extension, of Muslim politics.

The political geography of Muslims operates at multiple levels. At the micropolitical level, it involves the ways in which households, families, neighborhoods, small communities, and sects weigh opportunities and chart courses of action that affect their well being. Even at this level, "locality" may refer to persons physically removed: Somalis in Cardiff or Turin may be consulted regularly on decisions affecting their families or households in Mogadishu. Other levels involve the calculations of regional and national elites, and the "market" forces of politics and economics as groups formulate their interests and plan their future on the basis of incomplete and shifting information. In the past, these various layers of political and moral awareness could be envisaged as separable spheres of activity, but the advent of mass education and mass communications has facilitated their intercalation.

In African-American Muslim households, for example, domestic space may serve as a way simultaneously to distance a Muslim family from its non-Muslim milieu and to breach the distance between the American Muslim and larger Muslim contexts. Curtains tend to be drawn, and the decorating of front doors with Arabic calligraphy signifies that in such houses "the hostile environment of racism, discrimination, and religious intolerance [is] locked out." Internal decoration, particularly in middle-class homes, is a mélange of Middle Eastern, African, Asian, and Western styles: "African American Muslims have thus taken small portions of various Muslim cultures and woven an interesting tapestry that transcends (without denying) both their American nationality and their ethnicity" (McCloud 1995:106, 110).

Geography is clearly not merely a physical construct; spatial relations may preeminently be a state of mind. Connections and disconnections, distance and proximity are notional, and perhaps all the more significant for that. Through television, images of political and religious authority as well as community are daily projected into domestic space (Ossman 1994); as we discussed in Chapter 5, other cultural technologies are also crucial to the dissemination of ideas and information. If, through these means, Muslims in Moroland in the southern Philippines and in Nigeria, as well as different Muslim groups within each society, acquire a sense of linkage between and among them, the implications are potentially immense.

First, the "decentering" of Islam away from a preoccupation with the Arabian peninsula allows an awareness of the myriad forms of relations—economic, cultural, political, social—that have developed among Muslims worldwide and that have little to do with their position relative to the supposed center (see, for example, von der Mehden 1993). One does not need to subscribe to the view that a "global ecumene" has emerged to recognize that at times "the peripheries talk back" (Hannerz 1989:70). Westerners flock to Indian mystics, dance to reggae music, and read the magical realist novels of Latin American authors. In the Muslim world, Arab states formulate questions of moral censorship on the basis of novels written by Salman Rushdie in Britain and Taslima Nasreen in Bangladesh. The long-term impact of the permeability of borders is not certain, but there is no doubt that Muslims are reshaping their identities and political agendas while becoming increasingly mindful of the manifold economic, communications, and social links among them.

Second, the “reduction” of distance may encourage those who hold minority views—as radicals, moderates, or conservatives—to join forces with like-minded persons elsewhere to accomplish common goals. The new political geography, blurring conventional social distinctions, empowering new groups, and challenging governments, may in the long run facilitate the emergence of pluralism, even as some forces in society vigorously resist it. In the sense that symbolic and political connections across national and other political boundaries may be encouraged, conventional understandings of “external” and “internal” appear doubtful.

*** Transnational Linkages

The ability of Muslims and Muslim states to adapt to changing circumstances is not in question, as we have indicated from the outset of this book; the compatibility of Islam and nationalism is beyond doubt. The appeal to Muslim unity—a doctrinal byproduct of tawhid, or the oneness of God—has masked accommodations in practice and ideas to the overwhelming reality of political decentralization and variety. Over the centuries, Muslims have been able to adjust to the superior power of the infidels, and hence to a territorially demarcated international system; moreover, they have adjusted to the existence of multiple centers of power, including multiple caliphs, within the broad umma. The result has been an elite—and perhaps popular—willingness to come to terms with the nationalist sentiments that have emerged since the nineteenth century and, increasingly in the mid– to late twentieth century, to deploy Islamic themes to buttress nationalist discourse (Piscatori 1986).

This de facto pluralism explains why pan-Islamic political integration has been minimal, despite the longstanding aspirations of Muslims such as Muhammad Iqbal who longed for Muslims “in their totality ... [to] range themselves under the Caliph” (Iqbal, cited in Esposito 1983:183). Indeed, the prospects for pan-Islamic integration were limited by several factors. Although the term was a European contrivance in the 1880s and was coined partially in conscious imitation of panHellenism, pan-Slavism, or pan-Germanism, it was promoted by Sultan Abdulhamid II (1876–1909) and supported by Ottoman propaganda and the proliferation of newspapers throughout the Muslim world. Yet the movement was thus identified with the weakening sultanate in Istanbul. When the Young Turks seized power in 1908, they accordingly deemphasized pan-Islam, although the theme was revived during World War I for tactical reasons. Moreover, colonial officials feared, and manipulated, pan-Islamic movements (for example, Landau 1990:54–64, 95–96, 103–29), and Muslim political elites, ruling at first in an informal alliance with the imperialists, solidified their power by promoting and articulating particular identities such as Egyptian, Iraqi, Nigerian, and Indonesian nationalisms. As a consequence, by the time the Turkish Grand National Assembly abolished the caliphate in March 1924, forceful divisions among Muslim political entities had already emerged. As the century has unfolded, they have become formidable features of Muslim political life.

So entrenched have these divisions become that, for the most part, Islamist groups have not called for the restoration of the caliphate. Rather, they seek to establish an Islamic state or Islamic order within their own national societies. A major exception to this pattern, however, has been Hizb al-Tahrir al-Islami (the Islamic Liberation party), which emerged out of the Muslim Brotherhood movement in Jerusalem in 1952. Its leader, Taqi al-Din al-Nabahani (1905–78), believed that only with the recreation of one Islamic state would the Muslim way of life be able to free itself of the corrupting influence of Western political and cultural imperalism, and only with the restitution of the caliphate would the Islamic state be able to maintain itself against the divisive forces of imperialism, nationalism, and secularism (al-Nabahani 1953a and 1953b; "Supplement" 1994). Because the restoration of the caliphate is an "obligation upon all Muslims in the world," it is an urgent matter for political agitation, and Hizb al-Tahrir becomes the vanguard party that will advance the caliphal revolution (Hizb utTahrir n.d.:1).[38] This notion of a "vanguard" party appears as the basis of the declaration of Algeria's Groupe Islamique Armée (GIA), which announced that it had reestablished caliphate rule in August 1994 ("Le GIA annonce" 1994).

Regardless of the status of the GIA's claim to caliphal rule, panIslam may be thought to be advanced by the Organization of the Islamic Conference (OIC), the interstate organization of the Muslim world which was founded in response to an arsonist's attack on the al-Aqsa mosque in Jerusalem in 1969 and, in a larger way, to the alignments of Arab and Muslim politics following the disastrous Arab defeat in the 1967 war with Israel. Consisting of fifty-two members, including several of the Central Asian republics and Palestine, it is committed to the advancement of solidarity among its members (the first objective indicated in Article 2 of the OIC charter). However, union of the Muslim members has not been specifically endorsed, and it has in fact been undermined. Indonesia and Nigeria have been anxious not to appear too closely identified with the organization for fear that it would brand them as "Islamic states" and thus imperil their fragile domestic legitimacy.[39] In addition, the charter is transparent on the need to defend the individual sovereignties of its members. Article 2 affirms the principles of respect for "non-interference in the domestic affairs of Member States" and "the sovereignty, independence, and territorial integrity of each Member State" (cited in al-Ahsan 1988:128– 29; Moinuddin 1987:84–100).

The short history of the OIC, moreover, reveals significant fissures: ideological differences between such pro-Western regimes as those in Tunisia, post-1973 Egypt, and Malaysia and relatively pro-Soviet regimes such as those in Syria or Libya; political differences among the monarchies, republics, and military juntas; and economic differences between the oil-rich and the poor, particularly in Africa. The OIC was unable to resolve the Iran-Iraq war (1980–88) or defuse Iraqi-Kuwaiti tension that led to the second Gulf crisis (1990–91). Furthermore, its counsels have been bypassed in the Palestinian-Israeli peace process, and, despite the offer of its Secretary-General to mediate in the dispute, it did little to settle the related difficulties of civil war and mass famine in Somalia. In the case of Bosnia, over which Muslims have been agitated, the OIC in December 1992 gave the United Nations (UN) Security Council a deadline of January 15, 1993, to provide effective support for the Muslims. If the UN failed to respond, it said, unspecified collective measures would be forthcoming

from the Muslim world. In the event, no action materialized either in January or in the May 1993 meeting of Muslim foreign ministers at Karachi.

The activities of the OIC need, however, to be put into perspective. As clear as its inability to resolve intra-Islamic disputes or to protect Muslim peoples has been, such purported “failures” are the norm of international organization; no other international agency, with the possible exception of the comprehensive UN system, has distinguished itself in regional conflict resolution. In addition, the OIC can count effective contributions in a number of areas: It helped to galvanize the international consensus against the 1979 Soviet invasion of Afhganistan and support for the Afghan mujahidin; its Al-Quds Committee (created in 1975 under the chairmanship of Morocco’s King Hassan), concerned with working for the liberation of Jerusalem, has focused attention on Israeli policies in the city and generally the Occupied Territories; the Islamic Solidarity Fund (established in 1974 and based in Jidda) has channelled funds to relief and charitable causes; and the Statistical, Economic, and Social Research and Training Center (created in 1978 with headquarters in Ankara) compiles data on economic interactions, including trade patterns and commercial ventures, of the Muslim states.[40] The most important component of the extensive OIC network is the Islamic Development Bank, which was established in Jidda in 1974. It has proven adept at targeting development projects to finance and it has become one of the most active aid agencies in the developing world (Meenai 1990; Wilson 1995).

While the picture is thus mixed, it is clear that the OIC has not advanced, and in fact does not intend to promote, tight political integration of the Muslim states. An interstate organization like others, it is the creation of its sovereign members and survives as long as it fulfills their interests. In this regard, it has been a success. Pakistan has found in it a convenient foil to India’s manipulation of the Non-Aligned Movement, and Malaysia has used it as a way to enhance its voice in world and regional counsels, particularly as neighboring Indonesia evinces a certain wariness toward the OIC. Turkey has never deviated from its commitment to the Western security alliance and is sometimes uncomfortable with OIC resolutions. Yet, after the widespread condemnation of Turkey’s invasion of Cyprus in 1974 and the worsening of the general economic situation from the late 1970s, the Turkish regime —particularly during military rule (1980–83)—appreciated the need to turn to the Muslim world for support of its foreign policy and for greater trade. Although at the Casablanca summit of December 1994 the OIC did not recognize the “Turkish Republic of Northern Cyprus” as a Muslim state or accept it as a full member, Turkey has largely been successful in promoting itself as the bridge between the North Atlantic Treaty Organization, to which it belongs, and the OIC. It thereby increases its international prestige while remaining unenthusiastic about more cohesive forms of political integration (Aykan 1994:73–196).

*** Raising Umma-Consciousness

Just as the emergence of a universal Islamic state is not on the horizon, neither are forms of pan-Islamic activity missing from the political geography of Muslims. As one scholar notes of

Catholicism, the development of religious orders such as the Jesuits, Dominicans, and Franciscans constituted a kind of “horizontal” transnationalism, not to mention pentacostalism, that clashed with the “veritcal” transnationalism of the Roman church (Della Cava 1991, 1993). In the case of Islam, vertical transnationalism is lacking, but there are three ways in which a horizontal transnationalism may be said to have political significance.

First, a range of non-state actors has emerged to promote da-wa, the “call” to Islam. Each may have their own particular versions of da-wa and Islam in mind, but in common they bind together networks of individuals and groups self-consciously committed to an Islamic community that is at once translocal and transclass.

As the creation and expansion of Sufi networks show, the general process of creating transnational Islamic networks is not new. Sufi brotherhoods have long formed transregional networks. Some, such as the Bektashiyya, founded in the thirteenth century, had a privileged role throughout the diverse lands of the Ottoman Empire. The order was closely identified with the Janissaries, the professional military body that played an important role in maintaining the Empire until Sultan Mahmud II (1785–1839) crushed them after an attempted rebellion in 1826. At the same time, he outlawed the Bektashiyya order, destroying its lodges, publicly executing three of its leaders, and exiling the rest (Lewis 1961:77–78). By the 1880s the Bektashiyya, like other orders, had again become politically influential and remained so through the early years of the independent Turkish republic (Lewis 1961:398–406). An estimated 10 to 20 percent of Turkey’s adult male population belonged to it just prior to 1925, when religious brotherhoods were outlawed in Turkey (Birge 1937).

As previously indicated, other orders, including the Tijaniyya and Qadiriyya (Abun-Nasr 1965; Brenner 1988), had extensive links throughout North and sub-Saharan Africa and often wielded significant political influence. Colonial intelligence officers, such as Octave Depont and Xavier Coppolani (1897) in Algeria, may have overestimated the organization of these orders as monolithic “pan-Islamic” conspiracies—their elaborate, multicolored end map showing crisscrossing lines of influence linking brotherhoods across national and colonial frontiers throughout the Muslim world. Nonetheless, these transnational linkages formed important channels for communication. Moreover, the hierarchies of dominance between Sufi masters (Arabic, shaykh; Persian, pir) and their disciples (murids in both languages) formed a pervasive and popularly understood framework of influence and authority. Often new political communities resulted. For example, by crossing existing ethnic and social boundaries of identity, the Khatmiyya in the Sudan “paved the way for the first Sudanese quasinational movement, the Mahdiyya” (Karrar 1992:170).

Sufi networks may not always be highly integrated. In the Kurdish areas of Iran, Turkey, and Iraq, the Naqshbandiyya maintain a vague sense of loyalty to the supreme mufti in Syria as the order’s head, but some Naqshbandi connections are loose

at best while others are tighter owing to marital and family ties (van Bruinessen 1992: 226–27). Sufi movements may have stronger links in many regions of sub-Saharan Africa, especially West Africa, and their connections are far from negligible in Turkey and Central Asia. In the Sudan, for instance, the Niassiyya, a branch of the Tijaniyya order, has gained in popularity at the expense of the older orders, especially among West African immigrants. Spiritually centered on Kaolack, Senegal, this hierarchical movement has facilitated linkages of various kinds—social, economic, and political—among its adepts in both the Sudan and the region. One observer estimates that their transnational connections have been so important that “in the 1986 elections [in the Sudan], all members of the Niassiyya were directed by Kaolack to support the candidates of the National Islamic Front” (al-Karsani 1993:141–42).

Contemporary nonstate actors include the Rabitat al-‹Alam al-Islami (the Muslim World League) and the Jami‹yyat al-Da‹wa al-Islamiyya (Islamic Call Society), among others (Schulze 1990). The former is especially active in dispensing Qur›ans and other religious material throughout the world,[41] sponsoring religious educational programs, and providing religious scholarships for students to study in Saudi or other Muslim world universities. In but one religious school in Kelantan in northeastern Malaysia in 1989, for example, the Rabita paid for ten student scholarships (out of ninety-four students), with one advanced student going to Umm al-Qura University in Saudi Arabia for more specialized training. Publications bearing the Rabita’s imprint were readily apparent in the school’s library. The Call Society engages in similar activities, although its work often transmits the particular, and idiosyncratic, thoughts of Colonel al-Qadhdhafi.

A notable feature of these da-wa groups is their vigorous publication activities. The Rabita, for example, publishes a widely distributed monthly periodical in several languages, Majallat al-Rabita (League Journal; English title, The Muslim World League Journal). A typical issue contains educational and didactic pieces on various aspects of Muslim history and ritual, such as the hajj, but it also includes articles on issues of immediate relevance such as the Bosnian crisis and, at times, a review of contemporary intellectual debates in the West such as that inspired by Samuel Huntington’s Foreign Affairs article on “The Clash of Civilizations” (Muslim World League Journal 1994). The Rabita’s Southeast Asian affiliate, the Regional Islamic Dakwah Council of Southeast Asia and the Pacific, publishes a regular periodical, alNahdah (The Renaissance) in thirteen regional languages, including English. The Libyan Call Society has published the periodical Risalat al-Jihad (Message of the Struggle), which in characteristically unrestrained language has criticized Muslim and non-Muslim regimes, as well as movements such as the Muslim Brotherhood, for errant behavior (for example, “al-Wihdat” 1984). The Mu›tamar al-‹Alam al-Islami (Muslim World Congress), based in Karachi, publishes a weekly newsletter, The Muslim World, which reports on events throughout the world and urges on readers an appropriate Muslim conduct. For example, in 1994, readers were encouraged to protest against the supposed plans of the Austrian government to award the European Literature Prize to Salman Rushdie’s novel, The Satanic Verses (“SecretaryGeneral’s Letter” 1994:1).

These nonstate organizations, particularly through their formal presentations of Islamic issues and standardization of language and approach, help to create incipient ideological communities that do not overlap neatly with those of state frontiers. The process of objectification is unfolding in the transnational arena as well as within national and local contexts.

A second and related way in which transnational Islam may be said to have political significance is in the increasing concern over the plight of Muslim minorities. In 1936, a new English-language journal, Genuine Islam, appeared in Singapore, which transmitted the Sufi ideas favored by its patrons but also regularly reported on Muslim concerns in Germany and elsewhere in the West as well as in Egypt, Palestine, and other largely Muslim societies (Weyland 1990:230–31). Today virtually every Muslim journal—such as Majallat al-Rabita, al-Nahdah, and others like the London-based Ahl al-Bayt (People of the [Prophet's] House), the Arabic and English language periodical of the Shi‹i Rabitat Ahl al-Bayt al-Islamiyya al-‹Alamiyya (World Ahl al-Bayt Islamic League)—has a section devoted to the problems and prospects of Muslim minority communities throughout the world. In the case of Ahl al-Bayt, "minority" often refers to Shi‹i communities within predominantly Sunni societies, as well as Muslim communities within nonMuslim societies. The Journal [of the] Institute of Muslim Minority Affairs has been especially effective in providing informed analyses of the diverse Muslim minorities of Asia, Europe, America, Africa, and even Latin America.

The dilemmas of Muslim minorities in the West are of special concern. A standard interpretation of Islamic traditions holds that Muslims must leave (hijra) or confront (jihad) un-Islamic society (dar al-harb [land of war] or dar al-kufr [land of unbelief]), and reside in dar al-Islam. Yet, because of economic or political deprivations or the desire to obtain education or reunite with family, Muslims have moved to Europe, the United States, and Australia in large numbers and now reside there permanently. This unexpected state of affairs has incited lively debate among Muslim intellectuals, with some arguing that hijra is permissible only as a strategy of da-wa—a way to propagate Islam— and others suggesting that this kind of migration is not only permissible but obligatory as a way for the umma to acquire the technical skills to progress (Masud 1990:42–43). Although a broad consensus appears to have emerged that the Muslim presence in Western societies is an irreversible fact of life, this state of affairs is not often viewed as satisfactory.

The debates within the minority communities themselves over the boundaries of accommodation to and protest against their home societies—the very stuff of their Muslim politics—have thus captured the attention of Muslim majority communities. Iranian publications, for example, follow these debates and speculate on the implications for their own understandings of Islam. Some are outrightly condemnatory, echoing the refrain commonly heard in the Muslim world that Muslim minorities, especially youth, are prey to the immoral and corrupting blandishments of Western materialism and popular culture (for

example, “WABIL Warns Muslim Immigrants” 1994). At the conclusion of a conference in London in January 1995 on relations between the Muslim and Western worlds, the intimate connection between the two “realms” of Islam—majority and minority Islam—was foremost in the minds of participants. They praised Saudi Arabia for its ostensible plans to launch a new Islamic satellite network to combat Westen media distortions of Islam. Satellite programming would penetrate Western societies and, by directly providing unbiased information on the Qur›an and hadith, link minority to majority. The Saudi Minister of Awqaf, Da‹wa, and Guidance, ‹Abdallah ibn ‹Abd alHasan al-Turki, said that it was imperative to find ways to rectify the image of Islam among Muslim minorities so as to help them avoid “the dissolution (tadhwib) of Muslim society in the minority country (bilad al-aqalliyat) in which they live (“Nadwat al-Islam fi wasa›il ali‹lam al-gharbi” 1995).

In explicitly acknowledging the permeability of frontiers—especially, as we have noted, in this age of globalized communication— Muslim leaders are subverting one of the presumed dichotomies of international relations: internal/external. On one level, it is conceded that dar al-kufr—or an intermediate, neutral realm, dar al-sulh (realm of truce) to which Western societies are often assigned—is an “external” domain in which Muslims routinely live. Yet, on another level, the defense and guidance of these very same Muslims are regarded as an “internal” Muslim prerogative. In such ways are the transnational dimensions of modern Islam transforming the Muslim political landscape.

A third reason why the transnational umma may be said to have acquired some substance is that Muslims are concerned with a number of “Muslim” issues. We do not mean to imply that these issues are Muslim in the sense that everyone understands them in a uniform or doctrinally defined way. Rather, they are Muslim in the sense that they take on symbolic currency and often play a part in Muslim politics. Examples of such issues include Afghanistan, Palestine, the Rusdhie affair, and Bosnia. In each, transnational concern is aroused because of the shared perception that Muslims and Islam are under attack and require defense.

Since at least the General Muslim Congress of December 1931, convened after the Wailing Wall riots of 1929 in order to promote protection of Muslim holy places, and more particularly the 1936–39 Palestinian Arab revolt against British rule, the issue of Palestine has exercised Muslim sentiment. The Congress, inspired by the mufti of Jerusalem, Hajj Amin al-Husayni (1897–1974), was intent on raising Muslim—and not simply Arab—consciousness about the growing Zionist movement and, of course, on soldifying his own ambitions to lead the Palestinian national movement (Kramer 1986:123–27). Since then and for reasons we outlined in Chapter 1, Muslims from around the world have identified themselves with the aspirations of the Palestinian people, and at times—such as in Egypt in the 1930s (see A. Cohen 1982:140–41)—manipulated the symbolic significance of the issue to validate their own claims to authority in the competition with rivals. “Palestine” has thus become a major element in the symbolic politics of Islam.

In Dhaka, Bangladesh, the Islamic Research Centre produced a characteristic book entitled The Palestine Issue and the Muslim World, which was “aimed at providing ... readers with an idea that it is the matter of faith in Islam and not adherence to the modern concept of Arab Nationalism that will ultimately decide the question of Palestine, nay, the conflict between Islam and the evil forces of Nimrod opposing it” (Jalil 1981:iv). The apocalyptic language highlights the depth of concern over the issue that has been felt in Bangladesh, and simultaneously undermines received notions that only the Arabs have an entitlement to the moral high ground in the defense of Palestine.

In South Africa, Muslims have been agitated over the Palestine question from at least 1948, and, in Durban for instance, a Palestine Islamic Solidarity Committee was established. Car stickers proclaiming support for the Palestinians have also become popular. The Muslim News, a leading newspaper in the Muslim community from 1960 to 1968, was a vocal critic of Zionism, even incurring an official ban on particular issues because of its inflammatory rhetoric. As sincere as Muslim sentiment doubtless was, another level of interaction was present. Identification with the Palestinians was at once an affirmation of Muslim “kinship” and a demand for justice for Muslims at home:

The Muslims throughout the world, be they in China or Palestine, see themselves as a single unit, linked by a dynamic that does not allow themselves to remain silent when people, especially those of the same faith, have their human rights trampled upon.... We, as Muslims, identify with the oppressed Palestinians because we experience oppression ourselves under unjust rulers in this country. If we are being accused, as Muslims, of importing the problems of the Middle East into this country we don’t deny the fact because the laws of South Africa force us to identify more closely with the oppressed people of Palestine. We are Muslims first and last, therefore, whatever happens to our brethren in the Middle East is of dire importance to us. In the same way that their problems are ours, our problems here in South Africa are theirs (cited in Haron

1993:224).

The Bosnian issue has also become a matter of general concern and has rapidly acquired prominence in the symbolic politics of Muslims. To give one example of grass-roots activity, Islamic Relief, the Central Women’s Association, and other Muslim organizations throughout Britain have organized fund-raising dinners and drives to assist the Bosnians, and many community leaders have called upon the OIC to send troops to the front (“Focus on Bosnia” 1994). In July 1993, six Muslim nations—Iran, Turkey, Malaysia, Bangladesh, Pakistan, and Tunisia—as well as the Palestine Liberation Organization offered to send up to eighteen thousand troops to support the Muslims (Curtius 1993), and at least Iran and Saudi Arabia seem to have provided covert assistance in the form of weapons, ammunition, and armored combat vehicles (Tabatabai 1993). To mixed effect, Muslim “vounteers” also went to Bosnia, as they had as mujahidin to Afghanistan. But Bosnia was not Afghanistan, and many of the volunteers “found the Muslims of Bosnia a peculiar lot, secularists through and

through, children of Europe lightly touched by the faith" (Ajami 1994:35). Yet, in a sense, this realization was less important than the general outrage at what has been viewed as a genocidal attack on Islam.

While many Muslims have thus denounced both the parsimony and hesitations of Muslim governments, they have also sharply attacked the West for its reversals of policy and failure to punish the "aggressive" Serbs. Some have even seen in the Western handling of the crisis a profoundly negative commentary on Western values. The Turkish president, for example, accused the West of a double standard in which the obvious aggressor was not punished because of engrained fears of a Muslim state in the midst of Europe (Pope 1993).

As with the Palestinian issue, the transformation of Bosnia into a Muslim issue has not lacked local effects. Turkish outspokenness has helped to enhance Turkey's influence in the Balkan region and, perhaps more importantly, to signal to Central Asian Muslims that it can be counted on as a committed friend. The Malaysian government was the first member state of the United Nations to break diplomatic relations with Serbia, and it has opened refugee camps for Bosnians and channeled humanitarian aid to them ("Malaysia's Stand on the Bosnian Issue" 1992). While thus advancing Malaysia's international standing, Prime Minister Mahathir (b. 1925; r. 1981–) has been able at the same time to solidify his own standing at home, particularly in light of the concern expressed on the issue by such important Muslim groups as ABIM. One indicator of his relative success is the favorable comment his lead has drawn from erstwhile critics of his regime. Chandra Muzaffar, a Muslim intellectual and founder of the reformist, citizens' rights group ALIRAN (Persatuan Aliran Kesedaran Negara, Society for National Consciousness), has in the past been placed under detention, but on this issue he has applauded the prime minister's forthright condemnation of Western equivocation (Khan and Abdullah 1993).

*** The Significance of Muslim Transnationalism: Tablighi Jama‹at

The nature of Muslim transnationalism may be elucidated by an examination of one transnational movement.[42] Tablighi Jama‹at is a movement that began in India in the late 1920s and is devoted to the propagation (tabligh) of Islam. It is principally directed toward fellow Muslims whose faith seems to have been corrupted or lapsed. Appealing originally to illiterate or semiliterate peasants but gradually attracting followers in the professions and among the well-educated, Tablighi Jama‹at expanded, at first, from the region of Mewat to most of the Indian subcontinent, and, then, from South Asia to the Arab world, Africa, Southeast Asia, Europe, and North America. One study indicates that the growth rate of the movement in Pakistan is higher than that of the hajj (Qurashi 1989).

Its rapid expansion may be explained by patterns of migration from the Indian subcontinent and by reliance on nearly worldwide networks of Indian merchants; the doctrinal simplicity

and transsectarianism of its ideology; and the tolerance of local governments in response to the movement's avowed apoliticism. Tablighi Jama‹at would thus seem to radiate outward from an originating center and to contribute toward the concretization of a religious and social identity not based on the political culture of the nation-state.

As with the earlier examples discussed, however, the transnationalism of Tablighi Jama‹at poses certain challenges to conventional assumptions:

**** Center-Periphery Relations

One could possibly argue that a hegemonic center exploits a weak periphery in transnational orders (for example, Baran 1957; Amin 1990). Yet, as we have suggested, the notion of a uniform central focus in Islam appears to be questionable (also see Eickelman and Piscatori 1990:12–14)—as perhaps one could even say of the Catholic church. The "ultramontism" of the papacy in the nineteenth century may in fact have entailed its subordination to French and Italian episcopates. The paramount position of Mecca in Islam is challenged by such other centers as Karbala and Qum (for the Shi‹a), Cairo (for the Sunnis), Touba in Senegal (for Mourid Sufis), and, not least, London and Paris (for the large number of European Muslims and Muslim visitors). Moreover, to assume that the center supersedes authentic local traditions may be tantamount to applying stereotyped standards of authenticity and cultural purity; these standards may constitute a caricature of Muslim societies that are constantly changing and, in several though differing ways, interconnected.

The Tablighis seem alternately to accord primacy to the Nizamuddin mosque and educational complex in India, the Arabia of the holy cities, and Dewsbury in Britain where large numbers of Tablighis annually congregate. It may have been the case in many countries that Tablighis hailed from South Asia, and it may be true that delegations routinely go there for inspiration and to participate in the regular international convocation (ijtima‹). Yet there is no evidence that local branches are either chiefly funded by or directed from an outside center, and, as testified by the examples of Morocco, France, and Belgium where Arab and European missionaries predominate, Indian Tablighis have not always been the direct agents of transmission.[43]

In fact, the Tablighi Jama‹at becomes localized over time, much as the Muslim Brotherhood has become "Jordanian" or "Syrian" despite its origins in Egypt, or, in the Catholic world, as churches have increasingly taken on national identities. As Immanuel Wallerstein says, universalist and particularist forces "are not opposites but a symbiotic pair" (1991:167). However present the sense of participating in a great enterprise or of belonging to the worldwide community of believers, Tablighis are so dependent on local—national, provincial, city, and village—resources that they are almost inevitably transformed by the "periphery." In Belgium, the Jama‹at "remains faithful to the objectives and the missionary principles established by the founder [Mawlana Muhammad Ilyas Kandhalawi (1885–1944)], and it

makes use of human resources provided by the secular society which also constitute the human material considered by the founder as targets for Tablighi action" (Dassetto 1988:163).

In contrast to what has often been expected of transnational interactions, local experiences, in time, may thus produce an impact on the wider movement. In Catholicism, Pope John Paul II remains critical of liberation theology in Latin America and elsewhere, but he cannot escape subtle shifts in his social thought as a result of his connections with worldwide Catholic networks. This dialectical relationship between "center" and "periphery" is also present in the Tablighi case. The experience of life in such industrial democracies as France or Canada, for example, may have inspired the general sense that women should be full participants of the movement and the specific provision for day-care centers. The Moroccan Jama‹at now provides creches for its members, and there is a woman's branch of the

Tablighis in Aligarh.

The pattern of localization may also be applicable to exponents of missionary work (da-is) who begin to identify with those they intend to convert. Although Tablighis from several countries may descend on Muslim communities in Malaysia or Nigeria with the intention of disturbing, and rooting out, supposedly locally inspired mispractices, they have often come to appreciate the force of such specific circumstances as multiculturalism, sectarianism, or an official ethos of secularism that the local inhabitants face.

**** Instrumentality and Competition of Transnational Forces

This localization of a transnational movement suggests that Muslim transnationalism does not simply undercut existing state structures and lead to "denationalization" as might have been assumed from a reading of at least part of the transnational literature (see, for example, Sakamoto 1975:198–99). To the contrary, a dual effect exists. On the one hand, the ideological appeal of nationalism and, to some extent, the autonomy of state policies are diminished by the enhancement of both the sense and the institutions of greater community. The Tablighis, in terms of rhetoric and cosmopolitan membership, direct followers toward the pan-Islamic umma.

On the other hand, national regimes attempt to use transnational linkages to solidify or advance their own influence, and the da-wa groups mentioned above often project the ideological agenda of their primary state sponsors. The Libyans use the Islamic Call Society to advance their influence, especially in Africa. Although the Muslim World Congress is less identified with the Pakistani government, its positions and those of the Zia ul-Haq regime were complementary.

Saudi Arabia utilizes the Muslim World League and such related organizations as al-Majlis al-‹Alami li-l-Masajid (the World Council of Mosques) and al-Nadwa al-‹Alamiyya li-l-Shibab al-Islami (the World Assembly of Muslim Youth) to advance its relatively conservative brand of Islam, particularly to counter Iranian-inspired movements and ideas. Recognizing the importance of global communications, moreover, Saudi businessmen, connected to ruling circles though not simply controlled by them, have become major media players in the Arabic-speaking world. In addition to Saudi government plans for an Islamic satellite network, the Middle East Broadcast Centre (MBC) based in London, which broadcasts in Europe and the Middle East and, since September 1993, the United States (via ANA, the Arab Network of America), is tantamount to a Saudi version of Cable Network News. Arab Radio and Television (ART) broadcasts via Cairo and Rome. Like the other Saudi-sponsored cable services, its intent to counter alien cultural influences is clear. In the words of one of ART's managers, "We will do anything we can do to protect our Arab children from the coming invasion from western countries" (Khalaf 1994). Saudi influence over the press is similarly strong. MBC owns the United Press International (UPI) wire service, and the Saudi Research and Marketing Company based in London owns at least ten newspapers and periodicals with an international distribution, including al-Hayat, al-Sharq al-Awsat, and al-Majalla (Khalaf 1994; Marlowe 1992).

The Saudis also less publicly support a variety of groups throughout the Muslim world. It is impossible to track the extent of these financial subventions and to whom they are directed, and the degree of Saudi involvement is almost certainly overstated. Yet there is no doubt that the Saudis have, at various times, provided assistance to groups such as Ikhwan al-Muslimun in Egypt and Jordan, Jama‹at-i Islami in South Asia and Britain, Hizb-i Islami in Afghanistan, Hamas in the Palestinian territories, factions of the Front Islamique du Salut in Algeria, Jama‹at Nasr al-Islam (Society for the Victory of Islam) in Nigeria, and the Warith ad-Din–led Nation of Islam in the United States (see Black, Pugh et al. 1992; Backmann 1990; Rubin 1995:182–83, 197–98; Legrain 1991:75–79; Kane 1994:495).

The much-vaunted export of the Iranian revolution is another example of how da-wa activities may convey the political imprint of their state sponsors. Ayatullah Khomeini left no doubt that the logic of the Islamic revolution required a transcending of Iranian frontiers:

The Iranian Revolution is not exclusively that of Iran, because Islam does not belong to any particular people.... We will export our Revolution throughout the world because it is an Islamic revolution. The struggle will continue until the calls "there is no god but God" and "Muhammad is the messanger of God" are echoed all over the world. (cited in Rajaee 1983:82–83)

It has been argued that the primary way of achieving these goals is education and propaganda, but the Iranians are widely believed to supply financial, political, and military

assistance to groups in various parts of the Muslim world. As with the Saudis, charges of Islamic revolutionary intrigue and influence often betray the exaggerated fears that many governments—in the West as well as the Muslim world— hold toward Iran. Yet there is no denying that Iran has provided logistical, training, and financial support to Hizbullah in Lebanon and, particularly since the Arab-Israeli peace process moved dramatically forward in 1993, to Hamas in the West Bank and Gaza. Iraqi Shi‹i groups such as Hizb al-Da‹wa al-Islamiyya and particularly al-Majlis al-A‹la li-l-Thawra al-Islamiyya fi-l-‹Iraq (the Supreme Assembly of the Islamic Revolution in Iraq) have also received significant amounts of Iranian assistance. Pasdaran or Revolutionary Guards have been despatched to the Biqa‹ Valley in Lebanon in support of Hizbullah and Islamic Jihad, and, putatively, to the Sudan where they are thought to bolster the Islamic-oriented military regime that seized power in 1985 (see Katzman 1993).

Calculated, state-sponsored efforts may prove counterproductive, however. In such circumstances, when the heavy hand of state manipulation becomes resented, a transnational movement like Tablighi Jama‹at may acquire an advantage. Clearly, a movement which appears apolitical—even though in fact it may not be—and which advocates a kind of anti-institutional pan-Islam would have its attractions. This appeal would, in turn, allow the movement to manipulate the transnational ideology of “Islam” for its own purposes.

Indeed, although the Jama‹at avers apoliticism (see Metcalf 1993: 593–96) and eschews confrontation with established authority, it inevitably participates in political activity as it propagates its message.[44] In light of what we have said about objectification, it would be surprising if politicization were avoided:

[T]he very radicalism of their faith and their models of reference are powerful elements in a critique of political systems, particularly those defining themselves as Islamic. Everything suggests that the Tablighis, far removed from power by virtue of their position in society, instead of attaching themselves to it engage in challenging its legitimacy. They go to the heart of the problem of power in “Muslim” countries without touching it (Dassetto 1988:162).

Even in societies such as Belgium, the self-conscious and standardized understanding of what Muslims regard as Islamic orthodoxy has telling effect. The Tablighis have used the law on associations to promote their group interests, and, in doing so, they have entered into competition with other Islamic da-wa or missionary groups such as the Rabita. The competition is rarely vitriolic, but it involves a pointed contest over who speaks for a morally transformative Islam.

Although the groups would deny it, the competition is over the right to manipulate the symbolic capital of Islam and, ultimately, territory: Who speaks for Islam here?

To modify Appadurai’s perspective, therefore, deterritorialization has its limits. Consistent with a worldview that interiorizes states of purity and unbelief but ends by a kind of exteriorization, the Tablighis view the Islamic realm (dar al-Islam) as the territory of the soul, but end by identifying it with the home, the local community, and only finally, the pan-Islamic community. Just as kufr (unbelief) or bida‹ (unacceptable innovations) are thought of as states of mind but dealt with on the level of social organization, dar al-Islam—sacred space—becomes externalized and identified with domestic and territorial space. This carries within it the seed of competition with other Muslim groups that espouse their own visions of Islamic community. The competitiveness and politicization of da-wa successively complicate the general transnational politics of Islam and render the search for pan-Islamic integration all the more difficult.

**** Blurring of Boundaries Between Internal and External

As the prior discussion suggests, traditional dichotomizations of “inside/outside” and “internal/external” are unhelpful in understanding the dynamics of Muslim politics. The state is obviously permeable and “invites religious encroachment, precisely but not wholly because it is increasingly concerned with matters traditionally associated with the religious domain” (Robertson and Chirico 1985:225). One may, however, also point to structural factors, such as large-scale migration—the consequence of crises of the world capitalist system like mass un- or under-employment and political repression (Gunatilleke 1986, 1991) — and ideological fluidity as a result of both the global communications network and the movement of peoples. One of the reasons why the reaction to Rushdie’s Satanic Verses in Britain was so vocal was that Britain encompasses roughly 1.5 million Muslims, among whom slightly more than half are of South Asian origin. Only a generation removed from their peasant origins, they are, in one view, sensitive to appeals framed in terms of defense of honor and tradition (Ruthven 1990).

But the process is complex. Given that, at least initially, they stand apart from the traditional norms of British society and are compelled to formulate their religious aspirations through the mediating language of English, they come to feel a certain form of solidarity as against Christian British society. They “become” Muslim, rather than Bangladeshi, Pakistani, Gujarati, or Pathan (compare Warner 1992: 32–33). Yet, at the same time, they remain open to the pulls of the “homeland.” British Muslims of South Asian origin are mainly Barelwis, who follow pirs and are mystical in orientation but who are not entirely averse to political activity. Their primary competitors are the Deobandis, whose tendency is toward scripturalism in spiritual matters and apoliticism in worldly matters. They have been especially adept at disseminating their message of inner reform, owing largely to the vigor and organizational skills of Tablighi Jama‹at.

For the Tablighis, therefore, Muslimness is being affirmed on one level of consciousness, while sectarianism on another is subtly invoked and manipulated. Identifiably sectarian

mosques and schools constitute fertile ground for the Tablighis, for they simultaneously provide a bridge between the external world of South Asian, Deobandi Islam and the internal world of British Islam, between the past of the family homeland and the future of their new home. In many ways, as we have seen throughout this work, the emergence of a transnational Muslim civil society (see Peterson 1992: 376–88; Lipschutz 1992) has constituted or reaffirmed local Muslim identities even as it may act to subvert traditional hegemonic relations. To use inadequate but evocative language, Islam out “there” is now “here,” and the here of contemporary Britain is intimately tied to and transformed by the world out there.

In breaking down the barriers, therefore, transnational linkages may both empower and endanger. On the one hand, the sense of the umma grows more palpable in important respects and affirms to Muslims that they are not alone in their struggles and aspirations. To use the metaphor of Kalim Siddiqui, they feel increasingly able to plug into the “global grid of the power of Islam” (Siddiqui 1990:7). Yet, on the other hand, it is also clear that states and local identities may be reinforced, not undermined, by transnational interactions. Moreover, the electrical grid metaphor can be countered with the metaphor of the conveyor belt: political ideas and problems from elsewhere may be brought directly into one’s society. As the Islamist hijacking of an Air France jet in late December 1994 indicates, the fear of the French authorities that the civil strife of Algeria would be imported to France is not without substance (Charpentier 1994; Sage 1994; Swain, Franchetti and Leppard 1995). As unpredictable as this intricate political geography is, it reveals a more subtle appreciation of Muslim politics than that afforded by an either-or frame of analysis.

*** The Civic Geography of Muslim Politics

In an earlier era, the interpretation of sacred texts throughout the Muslim world was predominately the domain of a religious elite. With the advent of mass education and mass communications, their reinterpretation has become more diffuse, engendering a heightened confrontation and bargaining over the often blurred boundaries of religion and politics. In one sense, this means a relativization in the interpretation of sacred texts. In his widely disseminated al-Kitab wa-lQur›an: Qira›a Mu‹asira (The Book and the Qur›an: A contemporary reading), the Syrian civil engineer Muhammad Shahrur (1992) draws an analogy between the Copernican revolution and Qur›anic interpretation, which he says has been shackled by the conventions of medieval jurists:

People believed for a long time that the sun revolved around the moon, but they were unable to explain some phenomena derived from this assumption until one person, human like themselves, said, ‘The opposite is true: The earth revolves around the sun.’... After a quarter of a century of study and reflection, it dawned on me that we Muslims are shackled by prejudices (musallimat), some of which are completely opposite the [correct perspective] (1992:29).

On issues ranging from the role of women in society to rekindling a “creative interaction” with non-Muslim philosophies, Shahrur argues that Muslims should reinterpret sacred texts anew and apply them to contemporary social and moral issues: “If Islam is sound [salih] for all times and places,” then we must not neglect historical developments and the interaction of different generations. We must act as if “the Prophet just ... informed us of this Book” (Shahrur 1992:44; see also, Shahrur 1994).

In some respects, Shahrur’s book is an intellectual equivalent in the Arab world to Allan Bloom’s The Closing of the American Mind (1987), and in this respect he is not alone in attacking both conventional religious wisdom and the intolerant certainties of religious radicals and in arguing instead for a constant and open reinterpretation of how sacred texts apply to social and political life. A Kuwaiti bookseller argued in 1993 that Shahrur’s book “is more dangerous than Rushdie’s Satanic

Verses, [because] Shahrur writes that he believes in the basic tenets of Islam like the rest of us” (cited in Eickelman 1993). Although most of the Arab mass media have avoided presenting the contents of his book, the attacks of the religious establishment against it have offered an indirect measure of its significance and inadvertently signaled its existence to new audiences. Like al-‹Azm (1994) and Binsa‹id (1993), among others, Shahrur argues that a proper understanding of the principles of Islamic jurisprudence enjoins dialogue and a willingness to understand diverse opinions, and that this dialogue entails adaptation and the continual renewal of religious understandings within a framework of civility. Of course, such “frameworks of civility” remain fragile, as indicated by the censorship of the collected articles of Sadiq al-Nayhum (d. 1994) (1994) by Lebanon’s highest Sunni religious authority, Dar al-Fatwa. The publisher, who had just relocated his business from London to Beirut, warned the Prime Minister that he would again leave Lebanon unless the censorship of this and other books was revoked. Over 120 Lebanese signed an open letter protesting the censorship (al-Rayyes 1995).

Such dialogue is not confined to the literati. Major innovations in the Muslim world have often come from the “edge” and the “periphery,” notions that are highly fluid, as Bulliet (1994:201–7) reminds us. Today’s innovators are more likely to be religiously minded engineers—such as Syria’s Muhammad Shahrur—or Iran’s late ‹Ali

Shar‹iati, a sociologist—than conventionally trained religious specialists. A second supposed “edge” is the explosively growing masses of urban poor throughout the post–World War II Muslim world. As Bulliet suggests, these recent migrants respond to leaders who emulate conventional forms of religious authority, but who also speak directly to them about things that matter, including “access to jobs, provision of social services, curbing of government neglect and corruption [and] morality in public behavior” (1994:202). As in the past, these transformations in religious sensibilities often come from the bottom up, rather than from established intellectual and political elites.

France is only one of many European states where there has been a major transformation in Muslim sensibilities. France, regarded through the 1970s as dar al-harb has become dar al-Islam for many believers, or—a somewhat intermediate position —dar al--ahd, or land of contractual peace, in which the state and religion reach a mutually satisfactory accommodation (Kepel 1994b:207). Thus, when Muslim militants speak about Islam in France, they implicitly claim that France and the state must adapt to Islam. Other Muslims act out a distinctly French Islam, suggesting that through education, socialization in French rather than in a Middle Eastern or South Asian language, and accommodation with non-Muslim neighbors, Islam as practiced and thought has taken a distinctly French form.

In France, as elsewhere, the state fails to manipulate Islam for its purposes, just as Muslims are unable to control fully the political and social environment in which Islam is practiced and expressed. In France, as in Germany, Britain, and the United States, Muslims are caught up in contexts in which they explicitly or indirectly contest and redefine the boundaries of Islam and politics. In so doing, often they challenge the boundaries of the state itself. Thus for France, the Algerian problem is not just a foreign concern, but a French one. As often as not, the Minister of the Interior takes the lead in defining French policy and in linking developments in France with those on the southern shore of the Mediterranean (see fig. 15).

Similarly, faxes sent to Saudi Arabia from outside the kingdom call into question the regime’s religious credentials and authority, forcing it to recognize these challenges and respond to them through the media it controls or influences, condemning those who copy or distribute documents that slander the “legitimate rule” as guilty of a sin equal to that of those who create them (al-‹Uthaymayn 1994). Especially since the Gulf crisis of 1990–91, Saudi Arabia has witnessed an explosion of public discussion on the fundamental nature of its society and politics. Earlier attempts at such debate can certainly be found, such as Prince Talal ibn ‹Abd al-‹Aziz’s unprecedented call for constitutional reform, Risala ila muwatin (Letter to a compatriot) (1985), originally written during the Nasserist-led challenges of the early 1960s. But the recent period is notable for the diversity and quantity of attacks on, and counterattacks from, a regime that prides itself on its paramount service to Islam. Cassettes of popular sermons, faxed indictments from individual dissidents, electronically mailed pronouncements of human rights groups, official fatawa and bayans of the Committee of Grand ‹Ulama, and publications of the Rabitat al‹Alam al-Islami (the Muslim World League) all compete for public support.

In this process, two trends are discernible. First, the Saudi government’s attempt to manipulate religious discourse to bolster its legitimacy has produced an ironic countereffect: It has stimulated critics to seek in the printed formulation of their own views the most effective means to mount their protest. In a society in which considerable pride has been placed in the ability of individuals to seek direct redress of their grievances in regular majlis sessions with the king and other notables, attentive publics have increasingly turned to less personalized and more formal ways to express themselves. Thus, for example, government policies generate publicly critical memoranda

(nasihas) that are responded to in official fatawa, which in turn encourage further unsolicited, and reproducible, “advice.”

[[d-f-dale-f-eickelman-and-james-piscatori-muslim-po-17.png][Fig. 15. “Good! Whew! In short, this isn’t going to be easy.” French Minister of the Interior explains to the police how to distinguish between “moderate Muslims” and “dangerous ‘fundamentalists.’”.]]

Second, among the disparate actors in Saudi society, a striking convergence of discourse is occurring. As we saw in Chapter 3, the Committee for the Defense of Legitimate Rights (Lajnat al-Difa‹ ‹an al-Huquq al-Shar‹iyya)—consisting of lay and religiously trained individuals—in its very name evokes the language of both human rights and shari-a. This overlapping of discursive worlds is likely to strengthen the appeal of formalized criticism of the regime among the literate classes of society—however educated—and hence pose formidable challenges to ruling circles. The constitutional statement of March 1992, reaffirming the kingdom’s Islamic destiny while articulating for the first time certain limitations on the power of government, indicates an official awareness, to some extent, of the need to be responsive. The boundaries of public life are being redrawn. Yet this reconfiguration—or, to change the metaphor, this opening of the Pandora’s box of “print Islam”—is intensifying the fragmentation of authority. In the medium term, this may well generate an Islamic-tinged authoritarianism—in the kingdom as throughout the Muslim world— but over the long term it may well precipitate a civic pluralism.

If one is optimistic, the intensified confrontation and bargaining now apparent throughout the region can be seen as the incorporation, even if grudgingly, of voices previously excluded from the political arena. Even if the formal rhetoric of conservative states still stresses a trickle-down theory of development, in which all good flows from the top, large numbers of people now have the means to question authority and—thanks to a communications revolution that has undermined the efficacy of state censors—the ability to learn about a world independent of that offered by the state.

The issue of Islam’s compatibility with democracy has been thoroughly explored for both the Middle East and other parts of the Muslim world (Hefner 1993; Madjid 1994; Norton 1993, 1995a, 1995b; Salamé 1994). Of signal importance is the strengthening of voluntary and nongovernmental organizations despite the fact that some terrain in the Muslim world may initially appear unpromising (compare Putnam 1993). Thus, it has been argued that Ottoman society lacked autonomous corporate bodies that could protect individuals against the arbitrary power of the state (see Ozbudun 1992:200–201). More recently, in a 1993 poll in Jordan, only 1.4 percent of respondents claimed affiliation with a political party and only 6.5 percent declared themselves prepared to do so in the future, in spite of an unprecedented wave of electoral activity—in 1993, Jordan had its second free parliamentary elections in four years (Brand 1995:148, 165). Yet politics pervaded the professional associations, labor unions, women’s groups, sports clubs, and family and tribal associations that proliferated

throughout Jordan. Through these associations, Jordanians could organize and express themselves and yet avoid a direct challenge to the state (Brand 1995:163–80).

Elsewhere, as in Morocco, recent municipal and parliamentary elections may appear indecisive, and certainly no triumph for organized political parties, but the numbers of people involved in registering, campaigning, arbitrating alleged irregularities, and voting have irreversibly heightened the general political consciousness (Eickelman 1994:269–70). Even though some people are disillusioned with existing political frameworks, most do not reject them outright. Some ruling elites undoubtedly cynically manipulate proclamations of adhesion to the "rule of law." Yet even in such cases, the act of claiming respect for such principles generates awareness among an increasingly sophisticated citizenry of what is needed to achieve a more just society.

In many Muslim majority countries, it can be argued that dynamic civil society can exist without formal political organizations because pervasive informal organizational structures often serve as the framework for effective political, social, and economic action. Over two decades ago, for example, James Bill suggested that an understanding of Iranian politics meant recognizing the significance of the dawra—an informal group of individuals who meet periodically. These circles could be formed through overlapping professional, religious, political, and economic ties, and networks of these interlocking coteries disseminated information and views and shaped forms of everyday resistance. Cumulatively, without an effective center or formal leadership for state authorities to co-opt, coerce, or suppress, such networks contributed to constraining the arbitrariness of the state and its exercise of authority. Dawras fragmented and re-formed as the interests of their members changed, and many individuals belonged to multiple circles (Bill 1973). Most Iranians assumed that real access to authority was through informal channels, so direct personal ties of trust and obligation, more than declared ideological preferences, were integral to understanding political action.

One scholar has noted with irony that the small-scale monarchies of the Arab Gulf best replicate the attributes of "oligarchic republicanism" that prevailed in ancient Athens (Salamé 1994:100; see also Hicks and al-Najjar 1995). Although many residents of such oil-rich states are noncitizens and lack political rights, males with full citizenship participate vigorously in far-reaching debates. In Kuwait, some of these debates take place in the reconstituted parliament; others occur in the context of networks of interlocking diwaniyyas—it is tempting to gloss the term as "salon"—which function much like the Iranian dawra. As we noted in Chapter 4, diwaniyyas in Kuwait can be for men, for women, or, since the 1990s, for both men and women. Added to these institutions are the jama-at ta‹awuniyya, neighborhood cooperative societies, which served as significant political arenas when Kuwait was deprived of its parliament and played a significant role in organizing daily life and resistance during the 1990–91 Iraqi occupation.

It might be argued that the Gulf states represent a special case of informal associations, but such ties are also crucial in larger political arenas. In Turkey, for example, the Islamic-oriented Welfare party (RP) won victories in the March 1994 local elections through a strategy that relied on building ties of interpersonal trust, taking “full advantage of neighborhood, regional, and other cultural bonds that tie people to one another in mutual assistance as well as its flip side: mutual obligation” (White 1995:11–12). In Algeria, the compact put forward by the FLN, in which citizens gave up political participation in exchange for economic security after Algeria’s independence in 1962, gradually eroded in the face of mounting inefficiency and corruption. As a last resort, the FLN in the period before military rule in January 1992 offered another “grand bargain,” this time a democratic one (Leca 1994:67–68)—granting new elites some access to authority in exchange for restored regime legitimacy and the prospects of future economic improvements and political liberalization. But it was too late for such a move to be convincing. Islamic associations, often existing on the margins of legality through the 1970s, gradually took over where state services had all but collapsed, building mosques, running schools and clinics, and providing services that the state was no longer willing or able to provide (Rouadjia 1990). The bonds of reciprocity and obligation created through these activities fostered a sense of moral and spiritual renewal and provided the necessary basis for Islamist organizations to create new political purpose and community and to achieve a significant victory in the 1990–91 Algerian elections (Vergès 1994:78– 82). In some views, civil society has all but collapsed in Algeria and the Sudan, but underlying mutual ties of commitment, concealed from state authorities and outsiders out of necessity, often exist independent of the state or in defiance of it (Simone 1994:67). These networks of understanding and reciprocal obligation make a semblance of collective life possible where the state has failed.

From Morocco through Turkey and Indonesia, formal civic institutions have begun to reach a critical mass with associations of migrants, journalists, human rights organizations, doctors, lawyers, women’s rights groups, and political parties. They are often built on the resilient framework of informal networks of trust and responsibility—informal associations—and the line between formal and informal associations is often exceedingly thin. Even in the Sultanate of Oman, seemingly removed from the vanguard of democratization and the development of civic associations, rising standards of education have created a citizenry that finds ways to breathe life into apolitical or moribund institutions. Discussions about fielding a sports team, improving hygiene in the market, or using a municipal budget to create a library or youth club rather than resurfacing a road or installing street lighting offer citizens an opportunity to express their views and learn to organize to get things done. Elsewhere, as in Morocco, the decision by a parents’ group to refurbish and pay for a prayer room in a secondary school, to offer lodging to indigent university students, or to offer medical services to the needy may be formally framed as apolitical activities, but they offer citizens the opportunity to work together, independent of state initiatives, to achieve common goals.

<right>

An exclusive focus on election results or the assertion that democracy is categorically either present or absent deflects attention from major changes taking place beneath the surface.

They suggest that a transition is being made to a less arbitrary, exclusive, and authoritarian rule, notwithstanding the conditions of rapid population growth, stagnating economies, rising unemployment, and a young citizenry that is more articulate than preceding generations and less patient with conventional political arrangements. Even if the “hidden transcript” often remains a better measure of political vitality than the “public” one (Bennani-Chraïbi 1994:283–93; compare Scott 1990), disillusion has not led inexorably to revolt or to religious and political radicalism. There may be disillusion with existing political frameworks, but this does not necessarily mean their outright rejection.

</right>

*** Of Paradigms and Policies

Lapidary formulas such as the “West versus Rest” (Huntington 1993) are deceptive in their Manichaean simplicity. This “essentializing” of civilizational traditions deflects attention from their internal and historical variations and from the vigorous internal debate among their adherents. Muslims, like other peoples, are themselves engaged in vigorous intellectual debates about the themes raised in this book. The upshot is Muslim “agency” in the sense that sociologist Anthony Giddens (1979:54, 256–57) uses the term—an individual’s or group’s capability to intervene, or to refrain from intervening, in a series of events so as to influence their course. Muslims increasingly perceive that Islam offers them agency, but not in the sense of a monolithic force. The new geography of Muslim politics also precludes a “West versus Rest” mentality because of the dissolution of prior notions of distance and frontier. A significant and continually growing Muslim voice is in the “West” itself. Muslim political voices are as likely to be heard in Washington as in Karachi, in Detroit as in Dhaka, and in Moscow as in Cairo. Because of permanent hijra (emigration), Western and Muslim societies are now on the threshhold of new understandings of one another.

Misleading in other respects, Huntington’s provocative formula reintroduced the concept of culture—albeit a dated and deeply flawed one—to the study of foreign policy and international relations and underscored the notion that nation-states are no longer the sole source of identity in politics. Civilizations, however, do not act on the human stage; actors are shaped by civilizational traditions. Even in societies labeled as “traditional”—or, alternatively, as populist—there is diversity and internal debate over identifying key civilizational values, who is “authorized” to articulate them, and how they are implemented. As a result, civilizations, like cultures, are “contested, temporal, and emergent” (Clifford and Marcus 1986:18). Essentializing formulations such as Huntington’s are pernicious because they deflect attention away from the cultural dynamics of political change.

Consistent with our argument throughout this book, Muslim politics is sufficiently complex that any attempt to reduce it to a single formula leads to mystification; rather than being monolithic, Muslim politics, while aspiring to umma-wide universals, derives its force and significance from the specific contexts, times, and localities in which it takes place. “Islam” cannot thus be a threat, any more than the “West” can be for Muslims, despite

Khomeinist demonization of all Western policy as inherently malicious and antithetical to Muslim aspirations. Muslim politics have a transnational dimension, but this does not imply that one Muslim cultural unit has coalesced or that a transnational Islamic space has acquired dominance. Even Muslims who denounce Western values accept many Western borrowings, as brought home by one religious activist in the Arab Gulf. In a 1978 interview, he explained how democracy would never take hold in the Muslim world because it was a concept alien to shura, which was Qur›anic and Islamic. In 1990, however, he asserted that al-dimuqratiyya (democracy) was compatible with Islam. When reminded of what he said a decade earlier, he replied: “Now we know better. Shura is not a major concept in the Qur›an and its few usages there are ambiguous. Democracy can be adapted to Islamic ideals” (interview with Dale F. Eickelman, April 27, 1990).

There is a way to think about politics and policy that goes beyond simply replicating the structure of political wisdom that dominated the cold war years. Responding to critics of his proposal to replace the cold war foreign policy paradigm with one based on the clash of civilizations, Huntington (1993:86) argues that people think “abstractly” when they think “seriously.” Although the cold war paradigm “could not account for everything that went on in world politics,” it accounted for “more important phenomena than any of its rivals” and “shaped thinking about world politics for two generations.” Huntington invokes Thomas Kuhn’s The Structure of Scientific Revolutions (1962) to assert that scientific advances consist “of the displacement of one paradigm by another.” By analogy, he claims that we need an equivalent “simple map of the post-Cold War world” (Huntington 1993:186–87).

A “simple map,” however, may be precisely the problem, especially if it is based on dated and misleading assumptions. Historians of science no longer focus almost exclusively on “theory,” as did Kuhn who, according to Peter Galison, invoked specific cases only to “confirm, refute, or generate theory” (1988:208). Galison, by way of comparison, proposes that those who seek to understand developments in science should avoid assuming that there is a fixed, hierarchical relation between theory, the instruments of perception, and experiment. There is no reason to assume that any one of these factors is inherently more important than the others. Similarly, a reliance on “simple” paradigms may inadvertently keep policymakers from envisioning alternative, more effective ways of thinking about other people’s politics.

In the specific context of Muslim politics, deemphasizing paradigms and reimagining the challenges policymakers will face in the years ahead entail listening to the many Muslim voices, not merely those of a Westernized elite. The first step is to learn to elicit their cultural notions of legitimate authority and justice and to recognize that ideas of just rule, religious or otherwise, are not fixed, even if some claim that they are. These notions are debated, argued, fought about, and reformed in practice. But the challenge is not only to recognize that such debates are occurring, although that recognition in itself would be salutary. More important is the need to place these debates in their settings, to understand the obstacles, false starts, accommodations, interconnections, and decisive shifts that have

emerged in Muslim political discourse and practice. In the end, such an understanding promises to undermine unreflective presumptions that Muslim relations with others are chiefly hostile, and that Muslim governance is almost inevitably arbitrary and authoritarian.

[1] Similar issues concerning the wearing of headscarves to cover women's hair and necks occurred in Great Britain at roughly the same time and were discussed in the popular press (for example, "School Backs Down in Scarf Battle" 1990).

[2] Although the number of female students wearing the headscarf has continued to grow in France, just over 700 wore it in schools as of June 1994 (Jelen 1994:82), making them a small number of France's school-age Muslim population. Their reduced numbers reaffirm the power of the headscarf to instigate a major national debate. Note, however, ambiguities in official and unofficial estimates of "veiling" in schools. One anonymous expert estimated students with headscarves at 2,000 in June 1994, but only 860 at the beginning of the 1994–95 academic year. The Ministry of the Interior, however, estimated headscarves in schools at 15,000 in September 1994. Although some of this variation is politically inspired, it also can relate to whether "discreet" or "minimalist" headscarves are also counted (Stein 1994:24).

[3] The citizen's decision to forego immediate and narrowly defined self-interest in the hope that others will do so for a mutually satisfactory solution—to sacrifice individual "rationality" for collective "rationality"—is a calculated gamble that theorists sometimes call the "prisoner's dilemma." Jon Elster goes so far as to say that "politics is the study of ways of transcending the Prisoner's Dilemma" (1976:249).

[4] Visits to shrines elsewhere in the Muslim world have also acquired political significance. For example, the newly established revolutionary leadership in Egypt, including Muhammad Neguib and Gamal 'Abdul Nasser, took part in the annual pilgrimage to the tomb of the founder of the Muslim Brotherhood, Hasan al-Banna, on February 13, 1953, the fourth anniversary of his assassination. Although Nasser and Neguib later split with the Brotherhood, they sought to acquire political legitimacy through association with this popular Muslim martyr (Mitchell 1969:111).

[5] Of course, the transformation of religious pilgrimages into political events is not unique to Islam. In Israel, for example, national politicians often appear at pilgrimages to the shrines of leading saints (saddiqim) venerated by Israeli Jews of North African origin. During election campaigns, they hope to benefit from televised broadcasts of these visits (Weingrod 1990:231).

[6] Throughout this book, we distinguish between ‘ulama, Muslim intellectuals who have been trained in the madrasa (mosque school) to master the traditional religious texts under acknowledged authorities of an earlier generation, and “new” religious intellectuals, religious leaders who have been educated primarily in modern, state-supported educational institutions (see Kepel and Richard 1990). We include in this group those religious leaders who have experienced both styles of education. For example, in Iran during the 1960s and 1970s, the majority of students failed entrance examinations for secondary schools and universities. This is because Iran had been following the French model of rigorous admissions examinations. Many students who failed these state examinations, but who had significant prior experience of state schooling, pursued madrasa education. In Morocco, partially in response to the perceived threat of Islamic radicalism, Hassan II tried to recruit senior Ministry of the Interior officials trained in both traditions.

[7] Salah al-Din al-‘Ayyubi (d. 1193), known in the West as Saladin, was a Kurdish general who took power in Egypt and Syria after overthrowing the Fatimid caliphate in 1169. In 1187, he recaptured Jerusalem from the Franks, but this conquest precipitated, in turn, the Third Crusade.

[8] Khomeini’s will, dated February 15, 1983, was made public upon his death in 1989.

[9] Whereas Shlomo Eisenstadt’s early work (for example, 1966) represents the school of thought that believed modernization would end in Western-style liberal democracy, Samuel Huntington (1968) pioneered the school of thought that preferred to speak of “order” rather than greater political participation as the end result.

[10] The Iranian revolution, which occurred in 1978 and 1979, was a sufficient counterexample to persuade the authors of this text to abandon this claim. In Bill and Leiden (1974:53), Yemen and Afghanistan are cited as examples of “backward” communities in which Islamic influence and control remain strong; in Bill and Leiden (1979:69), Yemen and Oman provide the examples, with Afghanistan (following abolition of the monarchy in 1973) dropped. The argument is dropped altogether from Bill and Springborg (1990), the third edition of this text. A notable exception to such views was presented by Donald Smith (1974:7). Because Islam is an “historical religious system,” which, unlike Hinduism and Buddhism, lives in time until it transcends time, it has proven to be adaptable throughout the centuries. Muslims, like Catholics, have a responsibility to bide their time as fairly and as comfortably as they can without adding to the misery of others; thus, waiting for the eschaton, they do their duty by promoting social justice and by coming to terms with the fluctuations of history.

[11] For a reappraisal of Marxist-Leninist theories of development as they apply to Afghanistan, see Korgun (1993).

[12] For detailed accounts of how Islamic law has been reformed in the twentieth century, see Anderson (1976) and Coulson (1964).

[13] Modern Islamic political theory is developing the idea that the people constitute the khalifa. Isma'il al-Faruqi, for example, says that men are "perfect in form and endowed with all that is necessary to fulfill the divine will... even loaded with the grace of revelation" (al-Faruqi 1986/1406:10; compare Moussavi 1992). Although al-Faruqi does not specifically do so, other writers are developing this point as the basis for popular participation as essential to governance.

[14] The Pakistani constitution of 1990 similarly displays the coexistence of contrasting notions of sovereignty. While reaffiriming that "sovereignty over the entire Universe belongs to Almighty Allah alone," it also speaks in the name of the people of Pakistan. Following the injunction of Muhammad 'Ali Jinnah, the founder of the nation, it is the people's will that Pakistan be a "democratic state based on Islamic principles of justice." They are to be ruled by their elected representatives, but "in accordance with the teachings and requirements of Islam as set out in the Holy Quran and Sunnah" (Preamble) (Pakistan 1990).

[15] Enayat (1982:69–83) provides an outstanding discussion of Rida's views on the Islamic state.

[16] Madan (1987:749), however, takes a highly negative view of the rise of Hindu, Sikh, Buddhist, and Muslim activism—he uses the term "fundamentalist"—in the political sphere. By referring to contemporary activism as a "perversion of religion" because it has no precedent in "traditional" societies, he recognizes the objectification of religious tradition but goes too far in assuming that only "traditional" religious expression and practice are authentic.

[17] Educational statistics for Egypt and Morocco are derived from the World Bank (1981–89) and for Oman from Oman (1979–89). These figures are necessarily approximate; as countries change their classification and reporting of educational institutions.

[18] Although al-Ghannouchi uses the term islamiyyun, he uses other terms that seem virtually synonymous with it. Although he often refers to those Muslims committed to change the world as simply "the Muslims" (al-mus-limun), it is clear that he means that they are distinguishable from the general community. This point is made apparent when he speaks of "the Islamic tendency" (al-tiyyar

al-islami)—an implicit setting-off of the “tendency” from other religious-minded Muslims as well as secular ones, including the political elites which he opposes (for example, 1992:52, 164). Consider also his phrase, “we who are answerable as an Islamic movement” (nahnu mas’ulun ka-haraka isIamiyyajCGhannushi 1992:47). All of these self-designations indicate a heightened awareness of Islam as an ideological system. In fact, Ghannouchi (1992:58) refers explicitly to “the source of Islamic thought or Islamic ideology” (nsl al-fikra al-islamiyya aw-idyulujiyya al-islamiyyq). His specific language is important because it indicates the implicit “objectification” of Islam. Although the term “Islamist” has only gained currency in the mid- to late-twentieth century, it first appeared in the medieval period in the work of Abu al-Hasan’ al-Ash’ari (d. 935), Maqalat al-Islamiyyin (The theses of the Islamists). His work influenced Ibn Taymiyya (d. 1328) (see al-Azm 1993a:99).

[19] Although the term “Wahhabism” is a convenient shorthand expression, the Saudis resist it for fear that it implies that their ideas and practices constitute a separate sect of Islam. They argue, somewhat disingenuously, that they are simply “Muslims,” but they accept the designation “unitarians” (muwah-hidim), advocates of the absolute oneness of God.

[20] In January 1988, a plan to impose income tax on foreign businesses and workers was canceled after protests (Ibrahim 1988a, 1988b).

[21] Pharaonism has long been a controversial feature of Egyptian political thought. Muhammad Husayn Haykal (1888–1956) and Salama Musa (1887–1958), a Copt, found in Egypt’s Pharaonic, pre-Islamic past the model for a postcolonial future of greatness. It at once connected Egyptians to a monotheistic past and disconnected them from a specifically Middle Eastern milieu. In this way, Egypt could be as “civilized” as Pharaonic Egypt—treating women equally with men, for example—and as modern as the European imperialists. Such pan-Islamic writers as Hafiz Ibrahim (1870–1932) and Ahmad Shawqi (1868–1932) also found some inspiration in the Pharaonic past (Gershoni and Jankowski 1986:166–70, 184–85, 270–71). However, Arab nationalists (for example, Yusif Haykal (1945:27), as well as more recent Islamists, have criticized such emphases as the result of a conscious policy of Westernization and de-Islamization (and, by extension, de-Arabization). The Islamic component has not been entirely absent in Pharaonic conceptualizations, but Muslim activists, in particular, have increasingly regarded the focus on Pharaonism as an intolerable celebration of the pre-Islamic jahiliyya.

[22] As what we call a “new” intellectual, Siddiqui is concerned with showing the representative nature of the Muslim Parliament. His words are worth citing at length as an expression of the politics of inclusiveness, especially because many British Muslims attacked the parliament as unrepresentative and as promoting Iranian interests:

Members have come from every part of Britain and from all Schools of Thought in Islam. What is more. Members of this Parliament are not drawn from any single section of British Muslim society. We are not all Arabic, Urdu, Punjabi, Farsi, Turkish, Bengali, Malay, or Hausa speakers. Those here today come from all linguistic and ethnic backgrounds of Muslims living in Britain. The only language common to all Members of the Muslim Parliament (MMPs) is English. Even more important is the fact that among us are men and women of a great variety of social and professional backgrounds. There are philosophers and academics, doctors and dentists, religious scholars and penitent Marxists, scientists and engineers, teachers and students, writers and journalists, and small businessmen and a few tycoons as well. But above all there are among us ordinary men and women whose only education has been through life's everyday hardships and the trials and tribulations of the first generation immigrant working classes. (Siddiqui 1992:6)

The literature of the parliament invites interested Muslims to join one of their "networks" of specialist and professional groups—educators, doctors, scientists, and businessmen (Muslim Parliament 1992).

[23] But the state-controlled Muslim Spiritual Board of the North Caucasus, established under Soviet rule, issued a fatiun condemning the idea that women could be Sufis (Benningsen and Wimbush 1985:68).

[24] A certain conservative Islamic line of thought overlaps with Western criticisms of the public-private dichotomy. Abu-1 A'la al-Mawdudi, for instance, spoke of Islam creating a benign kind of "Islamic totalitarianism" in which "no one can regard his affairs as personal or private" (cited in Esposito 1987:147).

[25] A study in the late 1970s of 526 male and female heads of household in Kuwait indicates that 43 percent of households had relatives living in the immediate vicinity. Fully 80 percent visited their kin at least once a week. A significant number were in business with relatives and depended on members of their extended family for assistance in illness, child care, financial matters, the search for employment, and personal and business problems. Sibling help was most prominent, followed by assistance from parents (al-Thakeb 1985:576).

[26] In a similar manner, Iranian officials have argued (like some Western feminists) that in the West, women's bodies are used as "commercial aids ... to increase the sale of consumer goods," thereby contributing to "the disintegration of the family system" (FBIS, NES-94-239, December 13, 1994, p. 52).

[27] Throughout the Muslim world, changes in the shari’a provisions on family law have been mooted over time and have met with varying degrees of success. Attempts to change the law in Egypt excited national controversy, and proposed reforms in 1943, 1945, 1960, 1966, and 1969 failed to be implemented. Law 44 of 1979—often called “Jehan’s law” after President Sadat’s wife—made significant changes and was supported by ‘ulama of the official establishment such as al-Azhar and judges of the shari’a courts. For example, it required the registration of a divorce with a notary public, thereby making it impossible for a husband to divorce his wife without her knowledge; second marriages were seen as injurious to the first wife; the mother was given priority in custodial matters; and divorced wives were entitled to compensaton if divorced without their consent or without just cause. The Muslim Brotherhood objected to the law, particularly its denial of the right to have multiple wives, and in 1985 the law was declared unconstitutional by the courts because it had been promulgated in an era of emergency rule. President Mubarak made crucial concessions to conservatives and secured the passage of Law 100 of July 1985. This version of the law said that second marriages were not necessarily injurious, and that a divorced wife is not automatically entitled to compensation.

The Tunisian Code of Personal Status of 1956 abolished polygamy and allowed women to initiate divorce. In 1968, women were granted the right to be employed outside the home without the permission of the husband. In 1981, the Code was amended, giving divorced women priority in the custody of their children; arranged marriages were outlawed; and the legal age for brides was set at eighteen (Fluehr-Lobban 1994:120–30; see also, Esposito 1982; Anderson 1976).

In the early 1970s, the Indonesian government proposed a new marriage law that departed significantly from traditional understandings of Islamic family law. The usually compliant ‘ulama reacted strongly to the proposed reform (Katz and Katz 1975), forcing the government to rewrite the law to take their criticisms into account. Among other issues, they objected to the provisions that would have required formal registration of marriages and required a Muslim man to seek permission from a civil court before taking more than one wife. Both men and women would also have been required to seek permission from a civil court before divorcing their spouses. Objections were also raised to reforms in the status of adopted children, which some thought contravened the customary Islamic focus on blood relationships by placing adopted children on the same legal plane as natural children. Article 11(2) was particularly controversial because it maintained that religious differences were not obstacles to marriage, thereby in effect sanctioning intermarriage. In 1992, Indonesia’s Minister of Religious Affairs precipitated further controversy when he suggested that, as a way to reduce the number of unmarried couples living together, interfaith marriages should be legalized. Dutch law, which allowed mixed marriages as a civil procedure, was finally abandoned in 1973–74 when the government responded to pressure from the ‘ulama and entrusted them with control over marriage matters. But in 1986, a lacuna in the law, which had allowed separate civil ceremonies for mixed faith couples, was also eliminated, and bureaucrats in the Ministry of Religious Affairs often insist— contrary to a conventional interpretation of Muslim traditions —that a nonMuslim woman first convert before being allowed to marry a Muslim man. However, in 1989 the Supreme Court adopted a reformist position, ruling that a Muslim

woman be allowed to marry her Christian fiance. Since then, confusion and uncertainty have prevailed. Underlying this has been Muslim—especially ‘ulama—fear of Christian missionary inroads into the Muslim community. By way of contrast, Abdurrahman Wahid of the Nahdatul Ulama has argued that mixed marriages are “imperfect” but permissible: “We can’t just say that these people who marry non-Muslims are losing their right to be a Muslim” (M. Cohen 1992).

[28] According to Abdurrahman Wahid, there are “hundreds” of women qadis in Indonesia. The first were appointed in the mid-1950s. Although this may seem to contradict al-Mawardi’s argument that women cannot serve as judges, he argues, the practice of appointing women to shari’a courts is justified on the grounds that, as Indonesia is not an Islamic state, al-Mawardi’s stricture does not apply (Wahid 1995).

[29] Personal communication, Carolyn Fluehr-Lobban, December 27, 1994.

[30] The number of schools for girls run by resistance organizations was higher than those operated for the refugees by the Pakistani government. In 1985, there were eleven primary schools and six secondary schools for girls (compared with 248 primary schools for boys), and six secondary schools for girls (compared with thirteen for boys). In the Pakistani educational sector, there were sixty-eight secondary schools for boys, but none for girls (Majrooh 1989:92).

[31] Such stage management is not confined to Muslim countries. When President Clinton met Salman Rushdie in November 1993, Clinton’s words were reported by the international press, but the White House did not allow photographs. In Britain, the opposite prevailed: Downing Street allowed a photograph of John Major’s meeting with Rushdie but no report of the words exchanged.

[32] Muhammad Husayn Fadlallah argues that a man must not indiscriminately discipline his wife but he may legitimately beat her if, without prior contractual arrangement, she refuses to have sexual relations with him. He argues that men have stronger sexual impulses than women, and, as these should be channeled through the sanctified institution of marriage, a wife’s refusal of intercourse is “rebellion” that must be punished (Khudr 1994; see also Fadlallah 1993). Sisters in Islam (1991), a Malaysian women’s group, presents a strongly contrary view of Islamic traditions.

[33] The precise Al Sa’ud genealogy is impossible to delineate because of shifting loyalties, affiliations, and leadership claims. As Andrew Shryock (in press) indicates in his account of oral history and textual authority in tribal Jordan, when ideas of a tribal past are primarily oral, claims of identity vary significantly with context and social position. Genealogical histories, “not meant to be universal,” coexist awkwardly with one another when set down in

writing. There is a search for “proper” sources, known to select individuals, and “constant allusion” to hidden, “accurate” versions of the past. For royalty of tribal origins, as for commoners, the structure of genealogical memory, like tribal society itself, is one of “power and pervasive inequality” (Shryock in press), in which subordinate persons and groups do not directly challenge the claims of the more powerful. Because the Masalikh tribal subdivision had declined in prominence in the prior three hundred years, King ‘Abd al- ‘Aziz preferred to indicate his family’s affiliation with a currently prominent group. He routinely referred to one of the heads of a major tribal grouping (the ‘Amarat) of the ‘Anayza confederation as his cousin, thus equating himself with the shaykh of the major tribe of a major group of the ‘Anayza, rather than to the subordinate grouping that the Masalikh had become. We are grateful to H. St. B. Armitage for explaining the intricacies of Al Sa’ud genealogy (personal communication, July 4, 1994).

[34] For the purpose of examining demographic trends, Weeks excludes countries with “significant” Muslim minorities, such as China. With only 1.5 percent of its population Muslim, (by 1988 figures), China’s fifteen million Muslim minority nonetheless exceeds the total population of all but seven Muslim-majority countries. Likewise, India’s estimated Muslim minority of over eighty-nine million in 1988 exceeded the total population of all Middle Eastern states and all but three Muslim-majority countries: Indonesia, Pakistan, and Bangladesh (Weeks 1988:8–9). Moreover, official Indian statistics indicate that the country’s Muslim population is increasing at a significantly higher rate than non-Muslim populations. In 1951,9’91 percent of India’s population was Muslim; by 1991, 12.2 percent of Indians were Muslim (cited in Shahabuddin 1994).

[35] In the 1992 elections at Birzeit University in the West Bank, Hamas took none of the nine student council seats. In the November 1993 Birzeit student elections—two months after the PLO-Israeli peace accord—Hamas participated for the first time in an electoral coalition with the anti-Arafat Popular Front for the Liberation of Palestine (PFLP) and the Democratic Front for the Liberation of Palestine. The coalition secured 52 percent of the vote, winning all nine of the council seats, of which Hamas took four. The victory was all the more significant because Birzeit is regarded as a Fatah stronghold. In the Islamic University in Gaza, Islamists have controlled the student council since the university was established in 1980. In 1992, Hamas obtained 89 percent of the vote, when Fatah did not participate in the elections. In December 1993, with formal Fatah involvement, Hamas won 81 percent of the vote and Islamic Jihad, 2 percent, while 11 percent went to Fatah and 2 percent to the PFLP (“Syria and Israel” 1993; Prusher 1993; “Radical Palestinian Groups” 1993). In June 1994, Hamas won only a single seat out of eleven in al-Najah University in Nablus; and in December 1994, at al-Azhar University in Gaza, Fatah received 76 percent of the votes, while Hamas and Islamic Jihad received 20 percent (“PLO Group” 1994; “Arafat’s Fatah” 1994). At Najah University in Nablus, student politics has been dominated by competition between the pro-PLO Shabiba and the Islamic Bloc. The latter controlled the student council in 1979–80, but when not in office it has vigorously promoted an Islamist agenda through publications like the magazine al-Muntalaq (The starting point) (see Barghouti 1991:210–13).

[36] In a 1992 speech, Ayatullah Khamene'i eulogized the power of the mosque and the Friday sermon: "You will yourselves recall the times of the revolution [of 1979], which began from the mosques. Today, too, mosques still act as centres whenever people do something or mobilise for political or military purposes." He recognizes the importance of the modern media in maximizing the mosque as a place to further the regime's goals: "I do not say that we should definitely use modem publicity equipment and instruments such as films and suchlike—except if, perhaps on some occasion or other, a prayer leader would want to" (cited in BBC SWB, ME/1322, A/3, March 6, 1992).

[37] This invocation of foreign, non-Muslim sources is certainly not new. To give but one example, Muhammad 'Abduh (1849–1905) cited the American writer on Islam, John William Draper ('Abduh 1954:15–16), as did the Indian intellectual, Ameer Ali (1922:221).

[38] Hizb al-Tahrir has become a transnational movement, operating in the Palestinian territories, Jordan, the Arabian peninsula, the Maghrib, Britain, and possibly Malaysia and Indonesia, among other places. Since the 1980s, it has become particularly active on British university campuses, and it publishes a regular periodical, al-Khilafah Magazine, in London. The intention may be to recruit Muslim students in Britain who would then, in their home countries, propagate its message, including unmitigated hostility toward the Arab-Israeli peace process (Oliver 1994; Fisher 1994). "The International Muslim Khilafah Conference" was held in August 1994 at Wembley Stadium, attracting a large number of Muslims and representatives of Muslim groups from around the world—and adverse reaction from the British and Western media, which viewed the conference as an international "fundamentalist" convocation at best, and as a possible cover for politically violent groups (Raufer 1994).

[39] The postindependence government of Indonesia fought a war against an Islamic insurgency, the Dar ul-Islam movement in West Java (1948–62) that was militating for the establishment of an Islamic state. The official state ideology, pancasila, while acknowledging a divine being, does not go any further and the prevailing ideological ethos in Indonesia is secular. This reflects official sensitivities both to demands for a fully constituted Islamic state in the largest "Muslim" country in the world, and to the presence of a number of non-Muslim religions throughout the archipelago. Although formally part of the OIC, Indonesia has tended to downplay its membership—unlike neighboring and sometimes rival Malaysia, which empahsizes its role in the OIC network. In the case of Nigeria, membership in the OIC had long been considered, and resisted. But in January 1986, ostensibly because of the influence of important Nigerian Muslims, the government announced its adherence to the organization. However, the resulting backlash, from mainly Christian sources, has caused the government to refrain from any active participation in its activities.

[40] This center produces a regular periodical entitled Journal of Economic Cooperation among Islamic Countries.

[41] Since the 1980s, the King Fahd Complex for the Printing of the Qur’an in Medina has produced vast quantities of Qur’ans. Supervised by a committee of religious officials and employing over 1,600 persons, the institution produces 9.5 million copies each year, including 3 million in languages other than Arabic. The figures available are not precise, but the importance of exporting the Qur’an is clear from what has been reported. Of the approximately 70 million Qur’ans printed from the early 1980s to 1992, in keeping with King Fahd’s directives, more than 50 million were sent outside of the kingdom: 45 million to Asia, 5 million to Africa, and 500,000 to Europe. Of the copies distributed inside Saudi Arabia, more than 5 million copies were given to pilgrims from various countries during the hajj (Complexe du Roi 1992).

[42] Much of the information in this section has been drawn from material presented a. a workshop on Tablighi Jama’at, sponsored by the Joint Committee for the Comparative Study of Muslim Societies of the Social Science Research Council and the American Council of Learned Societies. It was held in London, June 7–8,1990 (Masud 1995).

[43] In Singapore, to cite another example, the All Malayan Muslim Missionary Society (commonly known as Jamiyah) was founded in the 1930s by a “transnational guru,” to use Peter van der Veer’s evocative phrase. Born in India, Muhammad Abdul Alim Siddiqui completed his studies in Mecca and Medina and eventually joined the Qadiriyya, Naqshbandiyya, Chistiyya, and Suhrawardiyya Sufi orders. No doubt, such cosmopolitanism would not permit a simple-minded devotion to the Mecca and Medina of Wahhabi control. Arab and Indian merchant families in Singapore played an important financial role from the beginning, and they seemed drawn to both Arabia and the Egypt of Salafiyya intellectual thought. Now strongly supported by the Muslim World League and reflecting its Saudi political agenda, the Jamiyah is predominantly Malay in membership while operating in an overhwhelmingly Chinese environment. The consequence is obvious: the sense of pull from Saudi Arabia, but also from Malaysia and Indonesia (Weyland 1990).

[44] In France, some observers believe that Tablighi Jama’at, despite its stated unconcern for political matters, functions as a recruitment vehicle for the expressly political Muslim protest groups. The Tablighis are particularly successful in attracting young, unemployed men at such suburban mosques as the Bilal in Saint-Denis and the Sid Brahim el Khalil mosque in La Courneuve. Perhaps originally motivated by a desire to improve their faith, these individuals may be open to explicit political activity, such as that associated with Fraternite Algerienne en France, a group allied with FIS (de Villiers 1995:5–6).

** Glossary

A = Arabic; F = French; I = Bahasa Indonesian; M = Malay; ML = Malagasy; P = Persian; R = Russian; U = Urdu; T = Turkish. Many of the terms, especially Arabic ones with religious connotations, occur in more than one language. Variations are specified only when significantly different from the language of origin.

~nlim; pl. ‘ulama (A). — Learned man; in particular, one learned in Islamic legal and religious studies.

amir (A). — Prince or tribal chief.

amir al-mu’minin (A). — Commander of the faithful.

baraka (A). — Supernatural blessing; quality of divine grace; abundance.

bay’a (A). — Pact, pledge.

bayan (A). — Decree, statement.

bid’a; pl. bida’ (A). — Unworthy innovation.

da’i; pl. du’a (A). — One who invites; missionary.

dar al-‘ahd (A). — “Land of the covenant,” i.e., under Muslim rule.

dar al-harb (A). — “Land of war”; against which war is religiously sanctioned.
dar al-Islam (A). — “Land of Islam.”

dar al-kufr (A). — “Land of disbelief.”

dar al-sulh (A). — “Land of settlement” or truce.

datu (M). — Honorary title granted by royalty.

da’wa (A). — God’s “call” to the true religion. Malay: dakwah.

al-dawla al-islamiyya (A). — Islamic state.

dawra (A, P). — “Circle”; discussion group.

dimuqratiyya (A). — Democracy.

din wa-dazvla (A). — Religion and state.

diwaniyya (A). — Regular informal gathering of relatives, professionals, members of the same religious group or workmates (Arab Gulf).

faqih; pl. fuqaha (A). — Islamic legal scholar; jurist (fem. faqiha). West African variation: faki.

faqir (A). — Sufi mendicant (fem. faqira).

fatwa; pl. fatawa (A). — Legal opinion or decree issued by a recognized Muslim scholar.

fiqh (A). — Islamic jurisprudence.

fitna (A). — Rebellion or disorder against established authority.

fundi (ML). — Religious authority (Comoros Islands).

ghayba (A). — Occultation, concealment (esp. in Shi’i theology).

hadith (A). — Reported saying of the Prophet Muhammad, based on the authority of a chain of reliable transmitters.

hajj (A). — Pilgrimage to Mecca.

halal (A). — Permitted food or activity.

haraka (A). — Movement.

hijab (A). — Veil or face covering.

hijra (A). — Migration. 1

hudud (A). — Prescribed Qur’anic punishments.

hukumat al-khilafa (A). — The government of the caliphate.

ihtijab (A). — Act of veiling.

ijtihad (A). — Independent judgment.

’ilm; pl. ’ulum (A). — Knowledge, esp. the religious sciences.

imam (A). — Religious or prayer leader.

islamiyyun (A). — “Islamists.” isra’ (A). — The Prophet’s night journey. jahil (A). — Ignorant (of Islam).

jahiliyya (A). —The pre-Islamic “time of ignorance.” jihad (A). — Religious struggle or endeavor; holy war. kafir (A). — Unbeliever in the Islamic revelation.

khadim al-haramayn (A). — “Servant of the Two Holy Places,” title of the Saudi monarch.

khalifa (A). — Caliph.

khatib (A). ’— Preacher (of Friday sermons).

khilafa (A). — The caliphate, the institution that inherited Muhammad’s authority in all domains except prophecy. I

khutba (A). — Friday sermon, lecture. I

kufr (A). — Disbelief. madhhab (A). — Established school of Islamic law.

madrasa (A). — Religious school, often associated with a mosque.

mahdi (A). — The expected, divinely guided leader.

majlis al-shura (A). — Consultative council.

marabout (F). — Sufi “saint.” French term from Arabic: murabit. See salih.

marja’-i taqlid; maraji’-i taqlid (P). — Source of emulation; paramount Shi’i religious authority.

maslaha ’amma (A). — Public interest.

mevlud (T). — A religious service commemorating Muhammad’s birthday (from Arabic: mawlid).

minhaj (A). — System or program. I

tni’raj (A). — Prophet’s midnight ascension from Jerusalem to the seven heavens.

Mudawwana (A). — The 1958 shari’a-based legal code that is the basis for Moroccan laws regarding marriage, family, and inheritance.

mufti (A). —Jurisconsult; issuer of fatawa.

mujahidin; sing, mujahid (A). — Lit. “strivers,” or those who struggle for the faith. Also used in a narrower sense to mean “freedom fighters,” as in the Afghan mujahidin. :

mukhabarat (A). — Security police; intelligence service.

mullah (P). — Preacher; prayer leader.

murid (A). — Sufi term for student or disciple.

murshid (A). — Sufi term for spiritual guide (fem. murshida).

nashid (A). — Chanted anthem.

nasiha (A). — Critical memorandum or report (Arab Gulf).

niqab (A). — Clothing that covers all of a woman’s body including the face.

I i nizam (A). — Order, organization.

nomenklatura (R). — “Named” or elite persons.

panqasila (I). — Indonesia’s secular national ideology.

pir (T, U). — Holy man, from a holy lineage; leader of a dervish order.

qadi (A). — Religious judge, magistrate (fem. qadiya).

qawm (A, P). — People or nation; kinship term in parts of Afghanistan.

quwwali (U, A). — Musical tradition in South Asia.

al-ra’is al-mu’min (A). — The “president-believer” (Egypt); term appropriated by Anwar al-Sadat.

salaf (A). — Ancestor, predecessor.

salafiyya (A). — Islamic reform movement founded at end of nineteenth century.

salih (A). — “Pious one,” or saint; a person, living or dead, thought to have a special relation toward God that enables him or her to ask for God’s grace on behalf of clients and to communicate it to them (North Africa).

sayyid (A). — Descendant of the Prophet (esp. Iraq and the Yemens).

shahada (A). — Declaration of faith in Islam; martyrdom.

shari’a (A). — The religious laws of Islam; “the straight path.”
shaykh (A). — A tribal leader, scholar, or senior (fem. shaykha).

Shi’a (A). — Literally, “sect.” Muslim minority community, principally located in Iran, southern Iraq, Lebanon, and Bahrain. Holds that legitimate succession to the Prophet is based on direct descent through his daughter, Fatima, and ‘Ali, her husband and the Prophet’s son-in-law.

shura (A). — Consultation.

sulta (A). — Political authority.

sunna (A). — Actions and sayings of the Prophet that constitute “orthodox” tradition for the Islamic community.

Sunni (A). — Muslim who belongs to the Muslim majority community; Sunnis accept the actions and authority of the early Muslim community and its caliphs.

sura (A). — Chapter of the Qur’an.

tabligh (A). — Propagation. Usually in the context of missionary activity. Related to da’wa,

tajdid (A). — Religious reform and renewal.

takfir (A). — The proclaiming of a fellow believer as an infidel.

taqlid (A). — Precedent.

tariqa (A). — Sufi brotherhood.

tawhid (A). — The oneness of God.

’ulama (A). — Muslim men of learning.

umma (A). — The Islamic community.

vilayat-i faqih (P). — Shi’i doctrine of the sovereignty of the jurist (Arabic: wilayat al-faqih.

waqf; pl. awqaf (A). — Pious endowment.

zakat (A). — Alms enjoined by the Qur’an.

ziyara (A). — Visit (to a saint’s shrine).

** Annotated Bibliography

A vast literature on Islam and politics exists and it would be impossible to provide an exhaustive review. Our intention, rather, is to highlight a number of works on several important themes that merit further examination and will serve as a point of departure for interested readers. Readers are also directed to other guides such as Burrell and Morgan (1989), Haddad, Voll, and Esposito (1991), and Brown (1992). The bibliographies that follow the relevant entries in the Oxford Encyclopedia of the Modern Islamic World (1995) are particularly helpful, while those in the second edition of the Encyclopaedia of Islam, begun in 1960 and still in progress, are usefully cross-referenced.

Both general and specific studies of the roles of Islam in politics have appeared with regularity since at least the advent of the Iranian revolution of 1978–79. Among others, Esposito (1980), Kramer (1980), Ayoob (1981), Dessouki (1982), Israeli (1982), Mortimer (1982), Piscatori (1983b), Dekmejian (1985), Carre and Dumont (1985), Carre (1987), and Hunter (1988) deal with the manifestations of the Islamic “revival” in a variety of countries in the Middle East, Africa, and Southeast Asia. Cole and Keddie (1986) and Kramer (1987) deal specifically with the mobilization of Shi’i discontent and assess the significance of Shi’i protest movements in Iran, Lebanon, the Gulf, and elsewhere. There are also many country- and region-specific studies of contemporary religious movements, such as Abdullah and Siddique (1986) on Southeast Asia, R. Tapper (1991) on Turkey, Nielsen (1992) on western Europe, Nakash (1994) on Iraq, and Villalon (1995) on Senegal.

Hussain (1984) compares and contrasts modernization, Marxist, nationalist, and “Islamic” perspectives on politics in the Muslim world, and Ismael and Ismael (1985) explain why Muslim politics is largely the search for legitimization by both governments and their critics. Esposito (1987) indicates the place of Islamic political movements in the modern history of Islam and explains the ideologies and programs of activists in diverse parts of the Muslim world. Organized both topically and geographically, Ayubi (1991) traces the development of political Islam from pre-Islamic Arabia to the present, focusing on what happened in the first

centuries of Islam and on the ways this early period has figured in subsequent Islamic political thought and practice. Roy (1992, 1994) argues that the Islamist project is doomed to failure because of its inability to articulate a detailed political vision or to implement a strategy for governing. Muslim politics have also been illuminated in such comparative studies of religious “fundamentalism” as Antoun and Hegland (1987), Lawrence (1989), Sivan and Friedman (1990), the Fundamentalism Project of the American Academy of Arts and Sciences (for example, Marty and Appleby 1991, 1993, 1994), and Kepel (1994a).

Classical and modern Islamic political thought has been elaborated in a number of works by Muslim and non-Muslim scholars. Asad (1980) and el-Affendi (1991) present modernist interpretations which argue that Muslim political orders are built on consensus and consultation and essentially involve limitations on the rulers and the participation of the ruled. Khomeini (1981), building on but also significantly departing from Shi’i traditions, provides the rationale for the governance of the ‘ulama. Enayat (1983), Sachedina (1988), and Modarressi (1991), among others, explain the basis of this doctrine of vilayat-i faqih. Arkoun (1994) considers the relationship between “church” and state and between ethics and politics in the context of his distinctive reformulation of Islamic thought in general.

Watt (1980) puts the development of early Muslim political thought in the context of seventh-century Arabia and demonstrates the continuities and discontinuities in the community’s ideological evolution. Lambton (1981) and Lewis (1988) provide further historical context, highlighting the medieval and early modern periods. Rosenthal (1965), Enayat (1982), Khadduri (1984), and Binder (1988) explain Muslim views on such modern themes as constitutionalism; democracy; socialism; legal, social, and political justice; and liberalism.
